BUFFER_POOL_INSTANCE	Buffer Pool identifier. From MariaDB 10.5.1 returns a value of 0, since multiple InnoDB buffer pool instances has been removed.
PAGES_USED	Number of pages of the size PAGE_SIZE which are currently in the buffer pool.
PAGES_FREE	Number of pages of the size PAGE_SIZE which are currently free, and thus are available for allocation. This value represents the buffer pool's fragmentation. A totally unfragmented buffer pool has at most 1 free page.
RELOCATION_OPS	How many times a page of the size PAGE_SIZE has been relocated. This happens when data exceeds a page (because a row must be copied into a new page) and when two pages are merged (because their data shrunk and can now be contained in one page).
RELOCATION_TIME	Time (in seconds) spent in relocation operations for pages of the size PAGE_SIZE. This column is reset when the INNODB_CMPMEM_RESET table is queried.

These tables can be used to measure the effectiveness of InnoDB table compression. When you have to decide a value for `KEY_BLOCK_SIZE`, you can create more than one version of the table (one for each candidate value) and run a realistic workload on them. Then, these tables can be used to see how the operations performed with different page sizes.

`INNODB_CMPMEM` and `INNODB_CMPMEM_RESET` have the same columns and always contain the same values, but when `INNODB_CMPMEM_RESET` is queried, the `RELOCATION_TIME` column from both the tables are cleared. `INNODB_CMPMEM_RESET` can be used, for example, if a script periodically logs the performances of compression in the last period of time. `INNODB_CMPMEM` can be used to see the cumulated statistics.

Example

```
SELECT * FROM information_schema.INNODB_CMPMEM\G
*********************** 1. row ***********************
            page_size: 1024
 buffer_pool_instance: 0
           pages_used: 0
           pages_free: 0
      reloacation_ops: 0
      relocation_time: 0
```

See Also

Other tables that can be used to monitor InnoDB compressed tables:

- INNODB_CMP and INNODB_CMP_RESET
- INNODB_CMP_PER_INDEX and INNODB_CMP_PER_INDEX_RESET

Information Schema INNODB_FT_BEING_DELETED Table

The Information Schema `INNODB_FT_BEING_DELETED` table is only used while document ID's in the related INNODB_FT_DELETED are being removed from an InnoDB fulltext index while an OPTIMIZE TABLE is underway. At all other times the table will be empty.

The `SUPER` privilege is required to view the table, and it also requires the innodb_ft_aux_table system variable to be set.

It has the following column:

Column	Description
DOC_ID	Document ID of the row being deleted. Either an underlying ID value, or a sequence value generated by InnoDB if no usable option exists.

This page is licensed: CC BY-SA / Gnu FDL

Information Schema INNODB_FT_CONFIG Table

The Information Schema `INNODB_FT_CONFIG` table contains InnoDB fulltext index metadata.

The `SUPER` privilege is required to view the table, and it also requires the innodb_ft_aux_table system variable to be set.

It has the following columns:

Column	Description
KEY	Metadata item name.
VALUE	Associated value.

Example

```
SELECT * FROM INNODB_FT_CONFIG;
+---------------------------+-------+
| KEY                       | VALUE |
+---------------------------+-------+
| optimize_checkpoint_limit | 180   |
| synced_doc_id             | 6     |
| last_optimized_word       |       |
| deleted_doc_count         | 0     |
| total_word_count          |       |
| optimize_start_time       |       |
| optimize_end_time         |       |
| stopword_table_name       |       |
| use_stopword              | 1     |
| table_state               | 0     |
+---------------------------+-------+
```

This page is licensed: CC BY-SA / Gnu FDL

Information Schema INNODB_FT_DEFAULT_STOPWORD Table

The Information Schema `INNODB_FT_DEFAULT_STOPWORD` table contains a list of default stopwords used when creating an InnoDB fulltext index.

The PROCESS privilege is required to view the table.

It has the following column:

Column	Description
VALUE	Default stopword for an InnoDB fulltext index. Setting either the innodb_ft_server_stopword_table or the innodb_ft_user_stopword_table system variable will override this.

Example

```
SELECT * FROM information_schema.INNODB_FT_DEFAULT_STOPWORD\G
*************************** 1. row ***************************
value: a
*************************** 2. row ***************************
value: about
*************************** 3. row ***************************
value: an
*************************** 4. row ***************************
value: are
...
*************************** 36. row ***************************
value: www
```

This page is licensed: CC BY-SA / Gnu FDL

Information Schema INNODB_FT_DELETED Table

The Information Schema `INNODB_FT_DELETED` table contains rows that have been deleted from an InnoDB fulltext index. This information is then used to filter results on subsequent searches, removing the need to expensively reorganise the index each time a row is deleted.

The fulltext index is then only reorganized when an OPTIMIZE TABLE statement is underway. The related INNODB_FT_BEING_DELETED table contains rows being deleted while an `OPTIMIZE TABLE` is in the process of running.

The `SUPER` privilege is required to view the table, and it also requires the innodb_ft_aux_table system variable to be set.

It has the following column:

Column	Description
DOC_ID	Document ID of the deleted row deleted. Either an underlying ID value, or a sequence value generated by InnoDB if no usable option exists.

Example

```
SELECT * FROM INFORMATION_SCHEMA.INNODB_FT_DELETED;
+--------+
| DOC_ID |
+--------+
|      2 |
+--------+

DELETE FROM test.ft_innodb LIMIT 1;

SELECT * FROM INFORMATION_SCHEMA.INNODB_FT_DELETED;
+--------+
| DOC_ID |
+--------+
|      2 |
|      3 |
+--------+
```

This page is licensed: CC BY-SA / Gnu FDL

Information Schema INNODB_FT_INDEX_CACHE Table

The Information Schema `INNODB_FT_INDEX_CACHE` table contains information about rows that have recently been inserted into an InnoDB fulltext index. To avoid re-organizing the fulltext index each time a change is made, which would be very expensive, new changes are stored separately and only integrated when an OPTIMIZE TABLE is run.

The `SUPER` privilege is required to view the table, and it also requires the innodb_ft_aux_table system variable to be set.

It has the following columns:

Column	Description
WORD	Word from the text of a newly added row. Words can appear multiple times in the table, once per DOC_ID and POSITION combination.
FIRST_DOC_ID	First document ID where this word appears in the index.
LAST_DOC_ID	Last document ID where this word appears in the index.
DOC_COUNT	Number of rows containing this word in the index.
DOC_ID	Document ID of the newly added row, either an appropriate ID column or an internal InnoDB value.
POSITION	Position of this word instance within the DOC_ID, as an offset added to the previous POSITION instance.

Note that for `OPTIMIZE TABLE` to process InnoDB fulltext index data, the innodb_optimize_fulltext_only system variable needs to be set to `1`. When this is done, and an `OPTIMIZE TABLE` statement run, the `INNODB_FT_INDEX_CACHE` table will be emptied, and the INNODB_FT_INDEX_TABLE table will be updated.

Examples

```
SELECT * FROM INNODB_FT_INDEX_CACHE;
+------------+--------------+-------------+-----------+--------+----------+
| WORD       | FIRST_DOC_ID | LAST_DOC_ID | DOC_COUNT | DOC_ID | POSITION |
+------------+--------------+-------------+-----------+--------+----------+
| and        |            4 |           4 |         1 |      4 |        0 |
| arrived    |            4 |           4 |         1 |      4 |       20 |
| ate        |            1 |           1 |         1 |      1 |        4 |
| everybody  |            1 |           1 |         1 |      1 |        8 |
| goldilocks |            4 |           4 |         1 |      4 |        9 |
| hungry     |            3 |           3 |         1 |      3 |        8 |
| then       |            4 |           4 |         1 |      4 |        4 |
| wicked     |            2 |           2 |         1 |      2 |        4 |
| witch      |            2 |           2 |         1 |      2 |       11 |
+------------+--------------+-------------+-----------+--------+----------+

Information Schema INNODB_FT_INDEX_TABLE Table

The Information Schema `INNODB_FT_INDEX_TABLE` table contains information about InnoDB fulltext indexes. To avoid re-organizing the fulltext index each time a change is made, which would be very expensive, new changes are stored separately and only integrated when an OPTIMIZE TABLE is run. See the INNODB_FT_INDEX_CACHE table.

The `SUPER` privilege is required to view the table, and it also requires the innodb_ft_aux_table system variable to be set.

It has the following columns:

Column	Description
WORD	Word from the text of a column with a fulltext index. Words can appear multiple times in the table, once per DOC_ID and POSITION combination.
FIRST_DOC_ID	First document ID where this word appears in the index.
LAST_DOC_ID	Last document ID where this word appears in the index.
DOC_COUNT	Number of rows containing this word in the index.
DOC_ID	Document ID of the newly added row, either an appropriate ID column or an internal InnoDB value.
POSITION	Position of this word instance within the DOC_ID, as an offset added to the previous POSITION instance.

Note that for `OPTIMIZE TABLE` to process InnoDB fulltext index data, the innodb_optimize_fulltext_only system variable needs to be set to `1`. When this is done, and an `OPTIMIZE TABLE` statement run, the INNODB_FT_INDEX_CACHE table will be emptied, and the `INNODB_FT_INDEX_TABLE` table will be updated.

Examples

```
SELECT * FROM INNODB_FT_INDEX_TABLE;
Empty set (0.00 sec)

SET GLOBAL innodb_optimize_fulltext_only =1;

OPTIMIZE TABLE test.ft_innodb;
+---------------+----------+----------+----------+
| Table         | Op       | Msg_type | Msg_text |

Information Schema INNODB_LOCK_WAITS Table

The Information Schema `INNODB_LOCK_WAITS` table contains information about blocked InnoDB transactions. The `PROCESS` privilege is required to view the table.

It contains the following columns:

Column	Description
REQUESTING_TRX_ID	Requesting transaction ID from the INNODB_TRX table.
REQUESTED_LOCK_ID	Lock ID from the INNODB.LOCKS table for the waiting transaction.
BLOCKING_TRX_ID	Blocking transaction ID from the INNODB_TRX table.
BLOCKING_LOCK_ID	Lock ID from the INNODB.LOCKS table of a lock held by a transaction that is blocking another transaction.

The table is often used in conjunction with the INNODB_LOCKS and INNODB_TRX tables to diagnose problematic locks and transactions.

This page is licensed: CC BY-SA / Gnu FDL

Information Schema INNODB_LOCKS Table

The Information Schema `INNODB_LOCKS` table stores information about locks that InnoDB transactions have requested but not yet acquired, or that are blocking another transaction.

It has the following columns:

Column	Description
LOCK_ID	Lock ID number - the format is not fixed, so do not rely upon the number for information.
LOCK_TRX_ID	Lock's transaction ID. Matches the INNODB_TRX.TRX_ID column.
LOCK_MODE	Lock mode. One of S (shared), X (exclusive), IS (intention shared), IX (intention exclusive row lock), S_GAP (shared gap lock), X_GAP (exclusive gap lock), IS_GAP (intention shared gap lock), IX_GAP (intention exclusive gap lock) or AUTO_INC (auto-increment table level lock).
LOCK_TYPE	Whether the lock is RECORD (row level) or TABLE level.
LOCK_TABLE	Name of the locked table,or table containing locked rows.
LOCK_INDEX	Index name if a RECORD LOCK_TYPE, or NULL if not.
LOCK_SPACE	Tablespace ID if a RECORD LOCK_TYPE, or NULL if not.
LOCK_PAGE	Locked record page number if a RECORD LOCK_TYPE, or NULL if not.
LOCK_REC	Locked record heap number if a RECORD LOCK_TYPE, or NULL if not.
LOCK_DATA	Locked record primary key as an SQL string if a RECORD LOCK_TYPE, or NULL if not. If no primary key exists, the internal InnoDB row_id number is instead used. To avoid unnecessary IO, also NULL if the locked record page is not in the buffer pool

The table is often used in conjunction with the INNODB_LOCK_WAITS and INNODB_TRX tables to diagnose problematic locks and transactions

Example

```
-- session 1
START TRANSACTION;
UPDATE t SET id = 15 WHERE id = 10;

-- session 2
DELETE FROM t WHERE id = 10;

-- session 1
USE information_schema;
SELECT l.*, t.*
    FROM information_schema.INNODB_LOCKS l
    JOIN information_schema.INNODB_TRX t
        ON l.lock_trx_id = t.trx_id
    WHERE trx_state = 'LOCK WAIT' \G

Information Schema INNODB_METRICS Table

The Information Schema `INNODB_METRICS` table contains a list of useful InnoDB performance metrics. Each row in the table represents an instrumented counter that can be stopped, started and reset, and which can be grouped together by module.

The `PROCESS` privilege is required to view the table.

It has the following columns:

Column	Description
NAME	Unique counter name.

Column	Description
SUBSYSTEM	InnoDB subsystem. See below for the matching module to use to enable/disable monitoring this subsystem with the innodb_monitor_enable and innodb_monitor_disable system variables.
COUNT	Count since being enabled.
MAX_COUNT	Maximum value since being enabled.
MIN_COUNT	Minimum value since being enabled.
AVG_COUNT	Average value since being enabled.
COUNT_RESET	Count since last being reset.
MAX_COUNT_RESET	Maximum value since last being reset.
MIN_COUNT_RESET	Minimum value since last being reset.
AVG_COUNT_RESET	Average value since last being reset.
TIME_ENABLED	Time last enabled.
TIME_DISABLED	Time last disabled
TIME_ELAPSED	Time since enabled
TIME_RESET	Time last reset.
ENABLED	1 if enabled, 0 otherwise
TYPE	Item type; one of counter, value, status_counter, set_owner, set_member.
COMMENT	Counter description.

Note: In MariaDB 10.4 and earlier the `ENABLED` column was called `STATUS`.

Enabling and Disabling Counters

Most of the counters are disabled by default. To enable them, use the innodb_monitor_enable system variable. You can either enable a variable by its name, for example:

```
SET GLOBAL innodb_monitor_enable = icp_match;
```

or enable a number of counters grouped by module. The `SUBSYSTEM` field indicates which counters are grouped together, but the following module names need to be used:

Module Name	Subsystem Field
module_metadata	metadata
module_lock	lock
module_buffer	buffer
module_buf_page	buffer_page_io
module_os	os
module_trx	transaction
module_purge	purge
module_compress	compression

Module Name	Subsystem Field
module_file	file_system
module_index	index
module_adaptive_hash	adaptive_hash_index From MariaDB 10.6.2, if innodb_adaptive_hash_index is disabled (the default), adaptive_hash_index will not be updated.
module_ibuf_system	change_buffer
module_srv	server
module_ddl	ddl
module_dml	dml
module_log	recovery
module_icp	icp

There are four counters in the `icp` subsystem:

```
SELECT NAME, SUBSYSTEM FROM INNODB_METRICS WHERE SUBSYSTEM='icp';
+------------------+-----------+
| NAME             | SUBSYSTEM |
+------------------+-----------+
| icp_attempts     | icp       |
| icp_no_match     | icp       |
| icp_out_of_range | icp       |
| icp_match        | icp       |
+------------------+-----------+
```

To enable them all, use the associated module name from the table above, `module_icp`.

```
SET GLOBAL innodb_monitor_enable = module_icp;
```

The `%` wildcard, used to represent any number of characters, can also be used when naming counters, for example:

```
SET GLOBAL innodb_monitor_enable = 'buffer%'
```

To disable counters, use the innodb_monitor_disable system variable, using the same naming rules as described above for enabling.

Counter status is not persistent, and will be reset when the server restarts. It is possible to use the options on the command line, or the `innodb_monitor_enable` option only in a configuration file.

Resetting Counters

Counters can also be reset. Resetting sets all the `*_COUNT_RESET` values to zero, while leaving the `*_COUNT` values, which perform counts since the counter was enabled, untouched. Resetting is performed with the innodb_monitor_reset (for individual counters) and innodb_monitor_reset_all (for all counters) system variables.

Simplification from MariaDB 10.6

From MariaDB 10.6, the interface was simplified by removing the following variables:

- buffer_LRU_batches_flush
- buffer_LRU_batch_flush_pages
- buffer_LRU_batches_evict
- buffer_LRU_batch_evict_pages

And by making the following reflect the status variables:

- buffer_LRU_batch_flush_total_pages: innodb_buffer_pool_pages_LRU_flushed
- buffer_LRU_batch_evict_total_pages: innodb_buffer_pool_pages_LRU_freed

The intention is to eventually remove the interface entirely (see MDEV-15706).

Examples

```
SELECT name,subsystem,type,comment FROM INFORMATION_SCHEMA.INNODB_METRICS\G
*************************** 1. row ***************************
     name: metadata_table_handles_opened
subsystem: metadata
     type: counter
  comment: Number of table handles opened
*************************** 2. row ***************************
     name: lock_deadlocks
subsystem: lock
     type: value
  comment: Number of deadlocks
*************************** 3. row ***************************
     name: lock_timeouts
subsystem: lock
     type: value
  comment: Number of lock timeouts
*************************** 4. row ***************************
     name: lock_rec_lock_waits
subsystem: lock
     type: counter
  comment: Number of times enqueued into record lock wait queue
*************************** 5. row ***************************
     name: lock_table_lock_waits
subsystem: lock
     type: counter
  comment: Number of times enqueued into table lock wait queue
*************************** 6. row ***************************
     name: lock_rec_lock_requests
subsystem: lock
     type: counter
  comment: Number of record locks requested
*************************** 7. row ***************************
     name: lock_rec_lock_created
subsystem: lock
     type: counter
  comment: Number of record locks created
*************************** 8. row ***************************
     name: lock_rec_lock_removed
subsystem: lock
     type: counter
  comment: Number of record locks removed from the lock queue
*************************** 9. row ***************************
     name: lock_rec_locks
subsystem: lock
     type: counter
  comment: Current number of record locks on tables
*************************** 10. row ***************************
     name: lock_table_lock_created
subsystem: lock
     type: counter
  comment: Number of table locks created

...

*************************** 207. row ***************************
     name: icp_attempts
subsystem: icp
     type: counter
  comment: Number of attempts for index push-down condition checks
*************************** 208. row ***************************
     name: icp_no_match
subsystem: icp
     type: counter
  comment: Index push-down condition does not match
*************************** 209. row ***************************
     name: icp_out_of_range
subsystem: icp
```

```
     type: counter
  comment: Index push-down condition out of range
*************************** 210. row ***************************
     name: icp_match
subsystem: icp
     type: counter
  comment: Index push-down condition matches
```

Information Schema INNODB_MUTEXES Table

The `INNODB_MUTEXES` table monitors mutex and rw locks waits. It has the following columns:

Column	Description
NAME	Name of the lock, as it appears in the source code.
CREATE_FILE	File name of the mutex implementation.
CREATE_LINE	Line number of the mutex implementation.
OS_WAITS	How many times the mutex occurred.

The `CREATE_FILE` and `CREATE_LINE` columns depend on the InnoDB/XtraDB version.

CURRENT

The table provides information about all columns listed in the previous table.

< 10.2.2

The table provides information about `rw_lock_t`, not about any mutexes.

The SHOW ENGINE INNODB STATUS statement provides similar information.

Examples

```
SELECT * FROM INNODB_MUTEXES;
+-----------------------------+--------------------+-------------+----------+
| NAME                        | CREATE_FILE        | CREATE_LINE | OS_WAITS |
+-----------------------------+--------------------+-------------+----------+
| &dict_sys->mutex            | dict0dict.cc       |         989 |        2 |
| &buf_pool->flush_state_mutex | buf0buf.cc         |        1388 |        1 |
| &log_sys->checkpoint_lock   | log0log.cc         |        1014 |        2 |
| &block->lock                | combined buf0buf.cc |        1120 |        1 |
+-----------------------------+--------------------+-------------+----------+
```

Information Schema INNODB_SYS_COLUMNS Table

The Information Schema `INNODB_SYS_COLUMNS` table contains information about InnoDB fields.

The `PROCESS` privilege is required to view the table.

It has the following columns:

Column	Description
TABLE_ID	Table identifier, matching the value from INNODB_SYS_TABLES.TABLE_ID.
NAME	Column name.
POS	Ordinal position of the column in the table, starting from 0. This value is adjusted when columns are added or removed.

Column	Description
MTYPE	Numeric column type identifier, (see the table below for an explanation of its values).
PRTYPE	Binary value of the InnoDB precise type, representing the data type, character set code and nullability.
LEN	Column length. For multi-byte character sets, represents the length in bytes.

The column `MTYPE` uses a numeric column type identifier, which has the following values:

Column Type Identifier	Description
1	VARCHAR
2	CHAR
3	FIXBINARY
4	BINARY
5	BLOB
6	INT
7	SYS_CHILD
8	SYS
9	FLOAT
10	DOUBLE
11	DECIMAL
12	VARMYSQL
13	MYSQL

Example

```
SELECT * FROM information_schema.INNODB_SYS_COLUMNS LIMIT 3\G
*************************** 1. row ***************************
TABLE_ID: 11
    NAME: ID
     POS: 0
   MTYPE: 1
  PRTYPE: 524292
     LEN: 0
*************************** 2. row ***************************
TABLE_ID: 11
    NAME: FOR_NAME
     POS: 0
   MTYPE: 1
  PRTYPE: 524292
     LEN: 0
*************************** 3. row ***************************
TABLE_ID: 11
    NAME: REF_NAME
     POS: 0
   MTYPE: 1
  PRTYPE: 524292
     LEN: 0
3 rows in set (0.00 sec)
```

Information Schema INNODB_SYS_DATAFILES Table

> **Note:**
>
> This table is deprecated and was removed in MariaDB 10.6.0.

The Information Schema `INNODB_SYS_DATAFILES` table contains information about InnoDB datafile paths. It was intended to provide metadata for tablespaces inside InnoDB tables, which was never implemented in MariaDB and was removed in MariaDB 10.6. The `PROCESS` privilege was required to view the table.

It contains the following columns:

Column	Description
SPACE	Numeric tablespace. Matches the INNODB_SYS_TABLES.SPACE value.
PATH	Tablespace datafile path.

Example

```
SELECT * FROM INNODB_SYS_DATAFILES;
+-------+--------------------------------+
| SPACE | PATH                           |
+-------+--------------------------------+
|    19 | ./test/t2.ibd                  |
|    20 | ./test/t3.ibd                  |
...
|    68 | ./test/animals.ibd             |
|    69 | ./test/animal_count.ibd        |
|    70 | ./test/t.ibd                   |
+-------+--------------------------------+
```

This page is licensed: CC BY-SA / Gnu FDL

Information Schema INNODB_SYS_FIELDS Table

The Information Schema `INNODB_SYS_FIELDS` table contains information about fields that are part of an InnoDB index.

The `PROCESS` privilege is required to view the table.

It has the following columns:

Column	Description
INDEX_ID	Index identifier, matching the value from INNODB_SYS_INDEXES.INDEX_ID.
NAME	Field name, matching the value from INNODB_SYS_COLUMNS.NAME.
POS	Ordinal position of the field within the index, starting from 0. This is adjusted as columns are removed.

Example

```
SELECT * FROM information_schema.INNODB_SYS_FIELDS LIMIT 3\G
*************************** 1. row ***************************
INDEX_ID: 11
    NAME: ID
     POS: 0
*************************** 2. row ***************************
INDEX_ID: 12
    NAME: FOR_NAME
     POS: 0
*************************** 3. row ***************************
INDEX_ID: 13
    NAME: REF_NAME
     POS: 0
3 rows in set (0.00 sec)
```

This page is licensed: CC BY-SA / Gnu FDL

Information Schema INNODB_SYS_FOREIGN Table

The Information Schema `INNODB_SYS_FOREIGN` table contains information about InnoDB foreign keys.

The `PROCESS` privilege is required to view the table.

It has the following columns:

Column	Description
ID	Foreign key name. Prior to MariaDB 12.1, this is preceded by the database name. From MariaDB 12.1, foreign key names are only required to be unique per table, not per database, so the redundant database name is not shown.
FOR_NAME	Database and table name of the foreign key child.
REF_NAME	Database and table name of the foreign key parent.
N_COLS	Number of foreign key index columns.
TYPE	Bit flag providing information about the foreign key.

The `TYPE` column provides a bit flag with information about the foreign key. This information is `OR`'ed together to read:

Bit Flag	Description
1	ON DELETE CASCADE
2	ON UPDATE SET NULL
4	ON UPDATE CASCADE
8	ON UPDATE SET NULL
16	ON DELETE NO ACTION
32	ON UPDATE NO ACTION

Example

Prior to MariaDB 12.1:

```
ELECT * FROM INFORMATION_SCHEMA.INNODB_SYS_FOREIGN\G
*************************** 1. row ***************************
      ID: test/fk_book_author
FOR_NAME: test/book
REF_NAME: test/author
  N_COLS: 1
    TYPE: 1
...
```

From MariaDB 12.1:

```
SELECT * FROM INFORMATION_SCHEMA.INNODB_SYS_FOREIGN\G
*************************** 1. row ***************************
      ID: fk_book_author
FOR_NAME: test/book
REF_NAME: test/author
  N_COLS: 1
    TYPE: 1
```

This page is licensed: CC BY-SA / Gnu FDL

Information Schema INNODB_SYS_FOREIGN_COLS Table

The Information Schema `INNODB_SYS_FOREIGN_COLS` table contains information about InnoDB foreign key columns.

The `PROCESS` privilege is required to view the table.

It has the following columns:

Column	Description
ID	
FOR_COL_NAME	Child column name.
REF_COL_NAME	Parent column name.
POS	Ordinal position of the column in the table, starting from 0.

Examples

Prior to MariaDB 12.1:

```
SELECT * FROM INFORMATION_SCHEMA.INNODB_SYS_FOREIGN_COLS\G
*************************** 1. row ***************************
          ID: test/fk_book_author
FOR_COL_NAME: author_id
REF_COL_NAME: id
         POS: 0
```

From MariaDB 12.1:

```
SELECT * FROM INFORMATION_SCHEMA.INNODB_SYS_FOREIGN_COLS\G
*************************** 1. row ***************************
          ID: fk_book_author
FOR_COL_NAME: author_id
REF_COL_NAME: id
         POS: 0
```

This page is licensed: CC BY-SA / Gnu FDL

Information Schema INNODB_SYS_INDEXES Table

The Information Schema `INNODB_SYS_INDEXES` table contains information about InnoDB indexes.

The `PROCESS` privilege is required to view the table.

It has the following columns:

Field	Type	Null	Default	Description
INDEX_ID	bigint(21) unsigned	NO	0	A unique index identifier.
NAME	varchar(64)	NO		Index name, lowercase for all user-created indexes, or uppercase for implicitly-created indexes; PRIMARY (primary key), GEN_CLUST_INDEX (index representing primary key where there isn't one), ID_IND, FOR_IND (validating foreign key constraint) , REF_IND.
TABLE_ID	bigint(21) unsigned	NO	0	Table identifier, matching the value from INNODB_SYS_TABLES.TABLE_ID.
TYPE	int(11)	NO	0	Numeric type identifier; one of 0 (secondary index), 1 (clustered index), 2 (unique index), 3 (primary index), 32 (full-text index).
N_FIELDS	int(11)	NO	0	Number of columns in the index. GEN_CLUST_INDEX's have a value of 0 as the index is not based on an actual column in the table.
PAGE_NO	int(11)	NO	0	Index B-tree's root page number. -1 (unused) for full-text indexes, as they are laid out over several auxiliary tables.
SPACE	int(11)	NO	0	Tablespace identifier where the index resides. 0 represents the InnoDB system tablespace, while any other value represents a table created in file-per-table mode (see the innodb_file_per_table system variable). Remains unchanged after a TRUNCATE TABLE statement, and not necessarily unique.
MERGE_THRESHOLD	int(11)	NO	0	

Example

```
SELECT * FROM information_schema.INNODB_SYS_INDEXES LIMIT 3\G
*************************** 1. row ***************************
       INDEX_ID: 11
           NAME: ID_IND
       TABLE_ID: 11
           TYPE: 3
       N_FIELDS: 1
        PAGE_NO: 302
          SPACE: 0
MERGE_THRESHOLD: 50
*************************** 2. row ***************************
       INDEX_ID: 12
           NAME: FOR_IND
       TABLE_ID: 11
           TYPE: 0
       N_FIELDS: 1
        PAGE_NO: 303
          SPACE: 0
MERGE_THRESHOLD: 50
*************************** 3. row ***************************
       INDEX_ID: 13
           NAME: REF_IND
       TABLE_ID: 11
           TYPE: 3
       N_FIELDS: 1
        PAGE_NO: 304
          SPACE: 0
MERGE_THRESHOLD: 50
3 rows in set (0.00 sec)
```

This page is licensed: CC BY-SA / Gnu FDL

Information Schema INNODB_SYS_SEMAPHORE_WAITS Table

The Information Schema INNODB_SYS_SEMAPHORE_WAITS table is meant to contain information about current semaphore waits. At present it is not correctly populated. See MDEV-21330.

The PROCESS privilege is required to view the table.

It contains the following columns:

Column	Description
THREAD_ID	Thread id waiting for semaphore
OBJECT_NAME	Semaphore name
FILE	File name where semaphore was requested
LINE	Line number on above file
WAIT_TIME	Wait time
WAIT_OBJECT	
WAIT_TYPE	Object type (mutex, rw-lock)
HOLDER_THREAD_ID	Holder thread id
HOLDER_FILE	File name where semaphore was acquired
HOLDER_LINE	Line number for above
CREATED_FILE	Creation file name
CREATED_LINE	Line number for above
WRITER_THREAD	Last write request thread id

Column	Description
RESERVATION_MODE	Reservation mode (shared, exclusive)
READERS	Number of readers if only shared mode
WAITERS_FLAG	Flags
LOCK_WORD	Lock word (for developers)
LAST_READER_FILE	Removed
LAST_READER_LINE	Removed
LAST_WRITER_FILE	Last writer file name
LAST_WRITER_LINE	Above line number
OS_WAIT_COUNT	Wait count

This page is licensed: CC BY-SA / Gnu FDL

Information Schema INNODB_SYS_TABLES Table

The Information Schema `INNODB_SYS_TABLES` table contains information about InnoDB tables.

The `PROCESS` privilege is required to view the table.

It has the following columns:

Field	Type	Null	Default	Description
TABLE_ID	bigint(21) unsigned	NO	0	Unique InnoDB table identifier.
NAME	varchar(655)	NO		Database and table name, or the uppercase InnoDB system table name.
FLAG	int(11)	NO	0	See Flag below
N_COLS	int(11) unsigned (>= MariaDB 10.5) int(11) (<= MariaDB 10.4)	NO	0	Number of columns in the table. The count includes two or three hidden InnoDB system columns, appended to the end of the column list: DB_ROW_ID (if there is no primary key or unique index on NOT NULL columns), DB_TRX_ID, DB_ROLL_PTR.
SPACE	int(11) unsigned (>= MariaDB 10.5) int(11) (<= MariaDB 10.4)	NO	0	Tablespace identifier where the index resides. 0 represents the InnoDB system tablespace, while any other value represents a table created in file-per-table mode (see the innodb_file_per_table system variable). Remains unchanged after a TRUNCATE TABLE statement.
FILE_FORMAT	varchar(10)	YES	NULL	InnoDB file format (Antelope or Barracuda).
ROW_FORMAT	enum('Redundant', 'Compact', 'Compressed', 'Dynamic') (>= MariaDB 10.5)varchar(12) (<= MariaDB 10.4)	YES	NULL	InnoDB storage format (Compact, Redundant, Dynamic, or Compressed).
ZIP_PAGE_SIZE	int(11) unsigned	NO	0	For Compressed tables, the zipped page size.
SPACE_TYPE	enum('Single','System') (>= MariaDB 10.5)varchar(10) (<= MariaDB 10.4)	YES	NULL	

Flag

The flag field returns the dict_table_t::flags that correspond to the data dictionary record.

Bit	Description
0	Set if ROW_FORMAT is not REDUNDANT.
1 to 4	0, except for ROW_FORMAT=COMPRESSED, where they will determine the KEY_BLOCK_SIZE (the compressed page size).
5	Set for ROW_FORMAT=DYNAMIC or ROW_FORMAT=COMPRESSED.
6	Set if the DATA DIRECTORY attribute was present when the table was originally created.
7	Set if the page_compressed attribute is present.
8 to 11	Determine the page_compression_level.
12 13	Normally `00`, but `11` for “no-rollback tables”.

Note that the table flags returned here are not the same as tablespace flags (FSP_SPACE_FLAGS).

Example

```
SELECT * FROM information_schema.INNODB_SYS_TABLES LIMIT 2\G
*************************** 1. row ***************************
     TABLE_ID: 14
         NAME: SYS_DATAFILES
         FLAG: 0
       N_COLS: 5
        SPACE: 0
   ROW_FORMAT: Redundant
ZIP_PAGE_SIZE: 0
   SPACE_TYPE: System
*************************** 2. row ***************************
     TABLE_ID: 11
         NAME: SYS_FOREIGN
         FLAG: 0
       N_COLS: 7
        SPACE: 0
   ROW_FORMAT: Redundant
ZIP_PAGE_SIZE: 0
   SPACE_TYPE: System
2 rows in set (0.00 sec)
```

Information Schema INNODB_SYS_TABLESPACES Table

The Information Schema `INNODB_SYS_TABLESPACES` table contains information about InnoDB tablespaces. Until MariaDB 10.5 it was based on the internal `SYS_TABLESPACES` table. This internal table was removed in MariaDB 10.6.0, so this Information Schema table has been repurposed to directly reflect the filesystem (fil_system.space_list).

The `PROCESS` privilege is required to view the table.

It has the following columns:

Column	Description
SPACE	Unique InnoDB tablespace identifier.
NAME	Database and table name separated by a backslash, or the uppercase InnoDB system table name.

Column	Description
FLAG	1 if a DATA DIRECTORY option has been specified in CREATE TABLE, otherwise 0.
FILE_FORMAT	InnoDB file format.
ROW_FORMAT	InnoDB storage format used for this tablespace. If the Antelope file format is used, this value is always Compact or Redundant. When a table's checksum algorithm is full_crc32 (the default from MariaDB 10.5), the value can only be Compressed or NULL.
PAGE_SIZE	Page size in bytes for this tablespace. Until MariaDB 10.5.0, this was the value of the innodb_page_size variable. From MariaDB 10.6.0, contains the physical page size of a page (previously ZIP_PAGE_SIZE).
ZIP_PAGE_SIZE	Zip page size for this tablespace. Removed in MariaDB 10.6.0.
SPACE_TYPE	Tablespace type. Can be General for general tablespaces or Single for file-per-table tablespaces. Removed MariaDB 10.5.0.
FS_BLOCK_SIZE	File system block size.
FILE_SIZE	Maximum size of the file, uncompressed.
ALLOCATED_SIZE	Actual size of the file as per space allocated on disk.
FILENAME	Tablespace datafile path, previously part of the INNODB_SYS_DATAFILES table. Added in MariaDB 10.6.0.

Examples

```
DESC information_schema.innodb_sys_tablespaces;
+---------------+---------------------+------+-----+---------+-------+
| Field         | Type                | Null | Key | Default | Extra |
+---------------+---------------------+------+-----+---------+-------+
| SPACE         | int(11) unsigned    | NO   |     | 0       |       |
| NAME          | varchar(655)        | NO   |     |         |       |
| FLAG          | int(11) unsigned    | NO   |     | 0       |       |
| ROW_FORMAT    | varchar(22)         | YES  |     | NULL    |       |
| PAGE_SIZE     | int(11) unsigned    | NO   |     | 0       |       |
| ZIP_PAGE_SIZE | int(11) unsigned    | NO   |     | 0       |       |
| SPACE_TYPE    | varchar(10)         | YES  |     | NULL    |       |
| FS_BLOCK_SIZE | int(11) unsigned    | NO   |     | 0       |       |
| FILE_SIZE     | bigint(21) unsigned | NO   |     | 0       |       |
| ALLOCATED_SIZE | bigint(21) unsigned | NO   |     | 0       |       |
+---------------+---------------------+------+-----+---------+-------+
```

```
SELECT * FROM information_schema.INNODB_SYS_TABLESPACES LIMIT 2\G
*************************** 1. row ***************************
         SPACE: 2
          NAME: mysql/innodb_table_stats
          FLAG: 33
    ROW_FORMAT: Dynamic
     PAGE_SIZE: 16384
 ZIP_PAGE_SIZE: 0
    SPACE_TYPE: Single

Information Schema INNODB_SYS_TABLESTATS Table

The Information Schema `INNODB_SYS_TABLESTATS` table contains InnoDB status information. It can be used for developing new performance-related extensions, or high-level performance monitoring.

The `PROCESS` privilege is required to view the table.

Note that the MySQL InnoDB and Percona XtraDB versions of the tables differ (see XtraDB and InnoDB).

It contains the following columns:

Column	Description
TABLE_ID	Table ID, matching the INNODB_SYS_TABLES.TABLE_ID value.
SCHEMA	Database name (XtraDB only).
NAME	Table name, matching the INNODB_SYS_TABLES.NAME value.
STATS_INITIALIZED	Initialized if statistics have already been collected, otherwise Uninitialized.
NUM_ROWS	Estimated number of rows currently in the table. Updated after each statement modifying the data, but uncommitted transactions mean it may not be accurate.
CLUST_INDEX_SIZE	Number of pages on disk storing the clustered index, holding InnoDB table data in primary key order, or NULL if not statistics yet collected.
OTHER_INDEX_SIZE	Number of pages on disk storing secondary indexes for the table, or NULL if not statistics yet collected.
MODIFIED_COUNTER	Number of rows modified by statements modifying data.
AUTOINC	Auto_increment value.
REF_COUNT	Countdown to zero, when table metadata can be removed from the table cache. (InnoDB only)
MYSQL_HANDLES_OPENED	(XtraDB only).

This page is licensed: CC BY-SA / Gnu FDL

Information Schema INNODB_SYS_VIRTUAL Table

The Information Schema `INNODB_SYS_VIRTUAL` table contains information about base columns of virtual columns. The `PROCESS` privilege is required to view the table.

It contains the following columns:

Field	Type	Null	Default
TABLE_ID	bigint(21) unsigned	NO	0
POS	int(11) unsigned	NO	0
BASE_POS	int(11) unsigned	NO	0

This page is licensed: CC BY-SA / Gnu FDL

Information Schema INNODB_TABLESPACES_ENCRYPTION Table

The Information Schema `INNODB_TABLESPACES_ENCRYPTION` table contains metadata about encrypted InnoDB tablespaces. When you enable encryption for an InnoDB tablespace, an entry for the tablespace is added to this table. If you later disable encryption for the InnoDB tablespace, then the row still remains in this table, but the `ENCRYPTION_SCHEME` and `CURRENT_KEY_VERSION` columns will be set to `0`.

Viewing this table requires the PROCESS privilege. It contains the following columns:

Column	Description
SPACE	InnoDB tablespace ID.
NAME	Path to the InnoDB tablespace file, without the extension.
ENCRYPTION_SCHEME	Key derivation algorithm. Only 1 is currently used to represent an algorithm. If this value is 0, then the tablespace is unencrypted.
KEYSERVER_REQUESTS	Number of times InnoDB has had to request a key from the encryption key management plugin. The three most recent keys are cached internally.
MIN_KEY_VERSION	Minimum key version used to encrypt a page in the tablespace. Different pages may be encrypted with different key versions.
CURRENT_KEY_VERSION	Key version that will be used to encrypt pages. If this value is 0, then the tablespace is unencrypted.
KEY_ROTATION_PAGE_NUMBER	Page that a background encryption thread is currently rotating. If key rotation is not enabled, then the value will be NULL.
KEY_ROTATION_MAX_PAGE_NUMBER	When a background encryption thread starts rotating a tablespace, the field contains its current size. If key rotation is not enabled, then the value will be NULL.
CURRENT_KEY_ID	Key ID for the encryption key currently in use.
ROTATING_OR_FLUSHING	Current key rotation status. If this value is 1, then the background encryption threads are working on the tablespace. See MDEV-11738.

When the InnoDB system tablespace is encrypted, it is represented in this table with the special name: `innodb_system`.

Example

```
SELECT * FROM information_schema.INNODB_TABLESPACES_ENCRYPTION
WHERE NAME LIKE 'db_encrypt%';
+-------+-----------------------------------------------+------------------+--------------------+--------
---------+--------------------+-------------------------+-----------------------------+
| SPACE | NAME                                          | ENCRYPTION_SCHEME | KEYSERVER_REQUESTS |
MIN_KEY_VERSION | CURRENT_KEY_VERSION | KEY_ROTATION_PAGE_NUMBER | KEY_ROTATION_MAX_PAGE_NUMBER |
+-------+-----------------------------------------------+------------------+--------------------+--------
---------+--------------------+-------------------------+-----------------------------+
|    18 | db_encrypt/t_encrypted_existing_key           |                1 |                  1 |
1 |                  1 |                    NULL |                        NULL |
|    19 | db_encrypt/t_not_encrypted_existing_key       |                1 |                  0 |
1 |                  1 |                    NULL |                        NULL |
|    20 | db_encrypt/t_not_encrypted_non_existing_key   |                1 |                  0 |
4294967295 |          4294967295 |                    NULL |                        NULL |
|    21 | db_encrypt/t_default_encryption_existing_key |                1 |                  1 |
1 |                  1 |                    NULL |                        NULL |
|    22 | db_encrypt/t_encrypted_default_key            |                1 |                  1 |
1 |                  1 |                    NULL |                        NULL |
|    23 | db_encrypt/t_not_encrypted_default_key        |                1 |                  0 |
1 |                  1 |                    NULL |                        NULL |
|    24 | db_encrypt/t_defaults                         |                1 |                  1 |
1 |                  1 |                    NULL |                        NULL |
+-------+-----------------------------------------------+------------------+--------------------+--------
---------+--------------------+-------------------------+-----------------------------+
7 rows in set (0.00 sec)

Information Schema INNODB_TABLESPACES_SCRUBBING Table

> **Note:**
>
> This table was removed in MariaDB 10.5.2 - see MDEV-15528.

The Information Schema `INNODB_TABLESPACES_SCRUBBING` table contains data scrubbing information.

The `PROCESS` privilege is required to view the table.

It has the following columns:

Column	Description
SPACE	InnoDB table space id number.
NAME	Path to the table space file, without the extension.
COMPRESSED	The compressed page size, or zero if uncompressed.
LAST_SCRUB_COMPLETED	Date and time when the last scrub was completed, or NULL if never been performed.
CURRENT_SCRUB_STARTED	Date and time when the current scrub started, or NULL if never been performed.
CURRENT_SCRUB_ACTIVE_THREADS	Number of threads currently scrubbing the tablespace.
CURRENT_SCRUB_PAGE_NUMBER	Page that the scrubbing thread is currently scrubbing, or NULL if not enabled.

Column	Description
CURRENT_SCRUB_MAX_PAGE_NUMBER	When a scrubbing starts rotating a table space, the field contains its current size. NULL if not enabled.
ON_SSD	The field contains 1 when MariaDB detects that the table space is on a SSD based storage. 0 if not SSD or it could not be determined

Example

```
SELECT * FROM information_schema.INNODB_TABLESPACES_SCRUBBING LIMIT 1\G
*************************** 1. row ***************************
                       SPACE: 1
                        NAME: mysql/innodb_table_stats
                  COMPRESSED: 0
         LAST_SCRUB_COMPLETED: NULL
        CURRENT_SCRUB_STARTED: NULL
    CURRENT_SCRUB_PAGE_NUMBER: NULL
CURRENT_SCRUB_MAX_PAGE_NUMBER: 0
         ROTATING_OR_FLUSHING: 0
1 rows in set (0.00 sec)
```

Information Schema INNODB_TRX Table

The Information Schema `INNODB_TRX` table stores information about all currently executing InnoDB transactions.

It has the following columns:

Column	Description
TRX_ID	Unique transaction ID number.
TRX_STATE	Transaction execution state; one of RUNNING, LOCK WAIT, ROLLING BACK or COMMITTING.
TRX_STARTED	Time that the transaction started.
TRX_REQUESTED_LOCK_ID	If TRX_STATE is LOCK_WAIT, the INNODB_LOCKS.LOCK_ID value of the lock being waited on. NULL if any other state.
TRX_WAIT_STARTED	If TRX_STATE is LOCK_WAIT, the time the transaction started waiting for the lock, otherwise NULL.
TRX_WEIGHT	Transaction weight, based on the number of locked rows and the number of altered rows. To resolve deadlocks, lower weighted transactions are rolled back first. Transactions that have affected non-transactional tables are always treated as having a heavier weight.
TRX_MYSQL_THREAD_ID	Thread ID from the PROCESSLIST table (note that the locking and transaction information schema tables use a different snapshot from the processlist, so records may appear in one but not the other).
TRX_QUERY	SQL that the transaction is currently running.
TRX_OPERATION_STATE	Transaction's current state, or NULL.
TRX_TABLES_IN_USE	Number of InnoDB tables currently being used for processing the current SQL statement.
TRX_TABLES_LOCKED	Number of InnoDB tables that have row locks held by the current SQL statement.
TRX_LOCK_STRUCTS	Number of locks reserved by the transaction.
TRX_LOCK_MEMORY_BYTES	Total size in bytes of the memory used to hold the lock structures for the current transaction in memory.

Column	Description
TRX_ROWS_LOCKED	Number of rows the current transaction has locked. locked by this transaction. An approximation, and may include rows not visible to the current transaction that are delete-marked but physically present.
TRX_ROWS_MODIFIED	Number of rows added or changed in the current transaction.
TRX_CONCURRENCY_TICKETS	Indicates how much work the current transaction can do before being swapped out, see the innodb_concurrency_tickets system variable.
TRX_ISOLATION_LEVEL	Isolation level of the current transaction.
TRX_UNIQUE_CHECKS	Whether unique checks are on or off for the current transaction. Bulk data are a case where unique checks would be off.
TRX_FOREIGN_KEY_CHECKS	Whether foreign key checks are on or off for the current transaction. Bulk data are a case where foreign keys checks would be off.
TRX_LAST_FOREIGN_KEY_ERROR	Error message for the most recent foreign key error, or NULL if none.
TRX_ADAPTIVE_HASH_LATCHED	Whether the adaptive hash index is locked by the current transaction or not. One transaction at a time can change the adaptive hash index.
TRX_ADAPTIVE_HASH_TIMEOUT	Whether the adaptive hash index search latch should be relinquished immediately or reserved across all MariaDB calls. 0 if there is no contention on the adaptive hash index, in which case the latch is reserved until completion, otherwise counts down to zero and the latch is released after each row lookup.
TRX_IS_READ_ONLY	1 if a read-only transaction, otherwise 0.
TRX_AUTOCOMMIT_NON_LOCKING	1 if the transaction only contains this one statement, that is, a SELECT statement not using FOR UPDATE or LOCK IN SHARED MODE, and with autocommit on. If this and TRX_IS_READ_ONLY are both 1, the transaction can be optimized by the storrage engine to reduce some overheads

The table is often used in conjunction with the INNODB_LOCKS and INNODB_LOCK_WAITS tables to diagnose problematic locks and transactions.

XA transactions are not stored in this table. To see them, `XA RECOVER` can be used.

Example

```
-- session 1
START TRANSACTION;
UPDATE t SET id = 15 WHERE id = 10;

-- session 2
DELETE FROM t WHERE id = 10;

-- session 1
USE information_schema;
SELECT l.*, t.*
    FROM information_schema.INNODB_LOCKS l
    JOIN information_schema.INNODB_TRX t
        ON l.lock_trx_id = t.trx_id
    WHERE trx_state = 'LOCK WAIT' \G
*************************** 1. row ***************************
                   lock_id: 840:40:3:2
               lock_trx_id: 840
                 lock_mode: X
                 lock_type: RECORD
                lock_table: `test`.`t`
                lock_index: PRIMARY
                lock_space: 40
                 lock_page: 3
                  lock_rec: 2
                 lock_data: 10
                    trx_id: 840
                 trx_state: LOCK WAIT
               trx_started: 2019-12-23 18:43:46
     trx_requested_lock_id: 840:40:3:2
          trx_wait_started: 2019-12-23 18:43:46
                trx_weight: 2
       trx_mysql_thread_id: 46
                 trx_query: DELETE FROM t WHERE id = 10
       trx_operation_state: starting index read
         trx_tables_in_use: 1
         trx_tables_locked: 1
          trx_lock_structs: 2
     trx_lock_memory_bytes: 1136
           trx_rows_locked: 1
         trx_rows_modified: 0
   trx_concurrency_tickets: 0
       trx_isolation_level: REPEATABLE READ
         trx_unique_checks: 1
    trx_foreign_key_checks: 1
trx_last_foreign_key_error: NULL
          trx_is_read_only: 0
trx_autocommit_non_locking: 0
```

This page is licensed: CC BY-SA / Gnu FDL

Information Schema TEMP_TABLES_INFO Table

> **Note:**
>
> This table was removed and is no longer a part of MariaDB. See MDEV-12459 for an alternative.

The Information Schema `TEMP_TABLES_INFO` table contains information about active InnoDB temporary tables. All user and system-created temporary tables are reported when querying this table, with the exception of optimized internal temporary tables. The data is stored in memory.

Previously, InnoDB temp table metadata was rather stored in InnoDB system tables.

It has the following columns:

Column	Description
TABLE_ID	Table ID.
NAME	Table name.
N_COLS	Number of columns in the temporary table, including three hidden columns that InnoDB creates (DB_ROW_ID, DB_TRX_ID, and DB_ROLL_PTR).
SPACE	Numerical identifier for the tablespace identifier holding the temporary table. Compressed temporary tables are stored by default in separate per-table tablespaces in the temporary file directory. For non-compressed tables, the shared temporary table is named ibtmp1, found in the data directory. Always a non-zero value, and regenerated on server restart.
PER_TABLE_TABLESPACE	If TRUE, the temporary table resides in a separate per-table tablespace. If FALSE, it resides in the shared temporary tablespace.
IS_COMPRESSED	TRUE if the table is compressed.

The `PROCESS` privilege is required to view the table.

Examples

```
CREATE TEMPORARY TABLE t (i INT) ENGINE=INNODB;

SELECT * FROM INFORMATION_SCHEMA.INNODB_TEMP_TABLE_INFO;
+----------+--------------+--------+-------+----------------------+---------------+
| TABLE_ID | NAME         | N_COLS | SPACE | PER_TABLE_TABLESPACE | IS_COMPRESSED |
+----------+--------------+--------+-------+----------------------+---------------+
|       39 | #sql1c93_3_1 |      4 |    64 | FALSE                | FALSE         |
+----------+--------------+--------+-------+----------------------+---------------+
```

Adding a compressed table:

```
SET GLOBAL innodb_file_format="Barracuda";

CREATE TEMPORARY TABLE t2 (i INT) ROW_FORMAT=COMPRESSED ENGINE=INNODB;

SELECT * FROM INFORMATION_SCHEMA.INNODB_TEMP_TABLE_INFO;
+----------+--------------+--------+-------+----------------------+---------------+
| TABLE_ID | NAME         | N_COLS | SPACE | PER_TABLE_TABLESPACE | IS_COMPRESSED |
+----------+--------------+--------+-------+----------------------+---------------+
|       40 | #sql1c93_3_3 |      4 |    65 | TRUE                 | TRUE          |
|       39 | #sql1c93_3_1 |      4 |    64 | FALSE                | FALSE         |
+----------+--------------+--------+-------+----------------------+---------------+
```

Information Schema INNODB_UNDO_LOGS Table

> **Note:**
>
> The `INNODB_UNDO_LOGS` are a Percona enhancement, introduced in version MariaDB 5.5.27 and removed in 10.0.

The Information Schema `INNODB_UNDO_LOGS` table is a Percona enhancement, and is only available for XtraDB, not InnoDB (see XtraDB and InnoDB). It contains information about the InnoDB undo log, with each record being an undo log segment. It was removed in MariaDB 10.0.

It has the following columns:

Column	Description
TRX_ID	Unique transaction ID number, matching the value from the information_schema.INNODB_TRX table.

Column	Description
RSEG_ID	Rollback segment ID, matching the value from the information_schema.INNODB_RSEG table.
USEG_ID	Undo segment ID.
SEGMENT_TYPE	Indicates the operation type, for example INSERT or UPDATE.
STATE	Segment state; one of ACTIVE (contains active transaction undo log), CACHED, TO_FREE (insert undo segment can be freed), TO_PURGE (update undo segment won't be reused and can be purged when all undo data is removed) or PREPARED (segment of a prepared transaction).
SIZE	Size in pages of the segment.

Information Schema ROCKSDB_CF_OPTIONS Table

The Information Schema `ROCKSDB_CF_OPTIONS` table is included as part of the MyRocks storage engine, and contains information about MyRocks column families.

The `PROCESS` privilege is required to view the table.

It contains the following columns:

Column	Description
CF_NAME	Column family name.
OPTION_TYPE	
VALUE	

This page is licensed: CC BY-SA / Gnu FDL

Information Schema ROCKSDB_CFSTATS Table

The Information Schema `ROCKSDB_CFSTATS` table is included as part of the MyRocks storage engine.

The `PROCESS` privilege is required to view the table.

It contains the following columns:

Column	Description
CF_NAME	
STAT_TYPE	
VALUE	

This page is licensed: CC BY-SA / Gnu FDL

Information Schema ROCKSDB_COMPACTION_STATS Table

The Information Schema `ROCKSDB_COMPACTION_STATS` table is included as part of the MyRocks storage engine.

The `PROCESS` privilege is required to view the table.

It contains the following columns:

Column	Description
CF_NAME	
LEVEL	
TYPE	
VALUE	

This page is licensed: CC BY-SA / Gnu FDL

Information Schema ROCKSDB_DBSTATS Table

The Information Schema `ROCKSDB_DBSTATS` table is included as part of the MyRocks storage engine.

The `PROCESS` privilege is required to view the table.

It contains the following columns:

Column	Description
STAT_TYPE	
VALUE	

This page is licensed: CC BY-SA / Gnu FDL

Information Schema ROCKSDB_DDL Table

The Information Schema `ROCKSDB_DDL` table is included as part of the MyRocks storage engine.

The `PROCESS` privilege is required to view the table.

It contains the following columns:

Column	Description
TABLE_SCHEMA	
TABLE_NAME	
PARTITION_NAME	
INDEX_NAME	
COLUMN_FAMILY	

Column	Description
INDEX_NUMBER	
INDEX_TYPE	
KV_FORMAT_VERSION	
TTL_DURATION	
INDEX_FLAGS	
CF	
AUTO_INCREMENT	

This page is licensed: CC BY-SA / Gnu FDL

Information Schema ROCKSDB_DEADLOCK Table

The Information Schema `ROCKSDB_DEADLOCK` table is included as part of the MyRocks storage engine.

The `PROCESS` privilege is required to view the table.

It contains the following columns:

Column	Description
DEADLOCK_ID	
TIMESTAMP	
TRANSACTION_ID	
CF_NAME	
WAITING_KEY	
LOCK_TYPE	
INDEX_NAME	
TABLE_NAME	
ROLLED_BACK	

This page is licensed: CC BY-SA / Gnu FDL

Information Schema ROCKSDB_GLOBAL_INFO Table

The Information Schema `ROCKSDB_GLOBAL_INFO` table is included as part of the MyRocks storage engine.

The `PROCESS` privilege is required to view the table.

It contains the following columns:

Column	Description
TYPE	
NAME	
VALUE	

This page is licensed: CC BY-SA / Gnu FDL

Information Schema ROCKSDB_INDEX_FILE_MAP Table

The Information Schema `ROCKSDB_INDEX_FILE_MAP` table is included as part of the MyRocks storage engine.

The `PROCESS` privilege is required to view the table.

It contains the following columns:

Column	Description
COLUMN_FAMILY	
INDEX_NUMBER	
SST_NAME	
NUM_ROWS	
DATA_SIZE	
ENTRY_DELETES	
ENTRY_SINGLEDELETES	
ENTRY_MERGES	
ENTRY_OTHERS	
DISTINCT_KEYS_PREFIX

Information Schema ROCKSDB_LOCKS Table

The Information Schema `ROCKSDB_LOCKS` table is included as part of the MyRocks storage engine.

The `PROCESS` privilege is required to view the table.

It contains the following columns:

Column	Description
COLUMN_FAMILY_ID	
TRANSACTION_ID	
KEY	
MODE	

This page is licensed: CC BY-SA / Gnu FDL

Information Schema ROCKSDB_PERF_CONTEXT Table

The Information Schema `ROCKSDB_PERF_CONTEXT` table is included as part of the MyRocks storage engine and includes per-table/partition counters .

The `PROCESS` privilege is required to view the table.

It contains the following columns:

Column	Description
TABLE_SCHEMA	
TABLE_NAME	
PARTITION_NAME	
STAT_TYPE	
VALUE	

Note: for multi-table queries, all counter increments are “billed” to the first table in the query:[1018] (https://github.com/facebook/mysql-5.6/issues/1018)

This page is licensed: CC BY-SA / Gnu FDL

Information Schema ROCKSDB_PERF_CONTEXT_GLOBAL Table

The Information Schema `ROCKSDB_PERF_CONTEXT_GLOBAL` table is included as part of the MyRocks storage engine and includes global counter information.

The `PROCESS` privilege is required to view the table.

It contains the following columns:

Column	Description
STAT_TYPE	
VALUE	

This page is licensed: CC BY-SA / Gnu FDL

Information Schema ROCKSDB_SST_PROPS Table

The Information Schema `ROCKSDB_SST_PROPS` table is included as part of the MyRocks storage engine.

The `PROCESS` privilege is required to view the table.

It contains the following columns:

Column	Description
SST_NAME	
COLUMN_FAMILY	
DATA_BLOCKS	
ENTRIES	
RAW_KEY_SIZE	
RAW_VALUE_SIZE	
DATA_BLOCK_SIZE	
INDEX_BLOCK_SIZE	
INDEX_PARTITIONS

Information Schema XtraDB Tables

- Information Schema CHANGED_PAGE_BITMAPS Table
- Information Schema XTRADB_INTERNAL_HASH_TABLES Table
- Information Schema XTRADB_READ_VIEW Table
- Information Schema XTRADB_RSEG Table

This page is licensed: CC BY-SA / Gnu FDL

Information Schema CHANGED_PAGE_BITMAPS Table

The Information Schema `CHANGED_PAGE_BITMAPS` table is a dummy table added to XtraDB with reset_table callback to allow `FLUSH NO_WRITE_TO_BINLOG CHANGED_PAGE_BITMAPS` to be called from `innobackupex`. It contains only one column, *dummy*.

For more information, see MDEV-7472.

The `PROCESS` privilege is required to view the table.

This page is licensed: CC BY-SA / Gnu FDL

Information Schema XTRADB_INTERNAL_HASH_TABLES Table

The Information Schema `XTRADB_INTERNAL_HASH_TABLES` table contains InnoDB/XtraDB hash table memory usage information.

The `PROCESS` privilege is required to view the table.

It has the following columns:

Column	Description
INTERNAL_HASH_TABLE_NAME	Hash table name
TOTAL_MEMORY	Total memory
CONSTANT_MEMORY	Constant memory
VARIABLE_MEMORY	Variable memory

Example

```
SELECT * FROM information_schema.XTRADB_INTERNAL_HASH_TABLES;
+--------------------------------+-------------+-----------------+-----------------+
| INTERNAL_HASH_TABLE_NAME       | TOTAL_MEMORY | CONSTANT_MEMORY | VARIABLE_MEMORY |
+--------------------------------+-------------+-----------------+-----------------+
| Adaptive hash index            |      2217568 |         2213368 |            4200 |
| Page hash (buffer pool 0 only) |       139112 |          139112 |               0 |
| Dictionary Cache               |       613423 |          554768 |           58655 |
| File system                    |       816368 |          812272 |            4096 |
| Lock System                    |       332872 |          332872 |               0 |
| Recovery System                |            0 |               0 |               0 |
+--------------------------------+-------------+-----------------+-----------------+

Information Schema XTRADB_READ_VIEW Table

The Information Schema `XTRADB_READ_VIEW` table contains information about the oldest active transaction in the system.

The `PROCESS` privilege is required to view the table.

It has the following columns:

Column	Description
READ_VIEW_UNDO_NUMBER	
READ_VIEW_LOW_LIMIT_TRX_NUMBER	Highest transaction number at the time the view was created.
READ_VIEW_UPPER_LIMIT_TRX_ID	Highest transaction ID at the time the view was created. Should not see newer transactions with IDs equal to or greater than the value.
READ_VIEW_LOW_LIMIT_TRX_ID	Latest committed transaction ID at the time the oldest view was created. Should see all transactions with IDs equal to or less than the value.

This page is licensed: CC BY-SA / Gnu FDL

Information Schema XTRADB_RSEG Table

The Information Schema `XTRADB_RSEG` table contains information about the XtraDB rollback segments.

The `PROCESS` privilege is required to view the table.

It has the following columns:

Column	Description
rseg_id	Rollback segment id.
space_id	Space where the segment is placed.
zip_size	Size in bytes of the compressed page size, or zero if uncompressed.
page_no	Page number of the segment header.
max_size	Maximum size in pages.
curr_size	Current size in pages.

The number of records will match the value set in the innodb_undo_logs variable (by default 128).

This page is licensed: CC BY-SA / Gnu FDL

Performance Schema

See Performance Schema Digests.

Statement digests aggregate statistics for similar queries by removing specific data values, allowing you to identify performance patterns across statement types.

See Performance Schema Overview.

The Performance Schema is a feature for monitoring server performance that inspects internal execution details at a low level with minimal overhead.

See Performance Schema Status Variables.

This page lists status variables that track the internal health of the Performance Schema, such as counters for lost events due to memory constraints.

See Performance Schema System Variables.

Configure the Performance Schema using these system variables to control buffer sizes, set instrumentation limits, and enable specific consumers at startup.

See Performance Schema Tables.

Explore the tables in the performance_schema database, which expose granular metrics on server events, locks, threads, and I/O for detailed performance analysis.

This page is licensed: CC BY-SA / Gnu FDL

Performance Schema Digests

The Performance Schema digest is a normalized form of a statement, with the specific data values removed. It allows statistics to be gathered for similar kinds of statements.

For example:

```
SELECT * FROM customer WHERE age < 20
SELECT * FROM customer WHERE age < 30
```

With the data values removed, both of these statements normalize to:

```
SELECT * FROM customer WHERE age < ?
```

which is the digest text. The digest text is used to compute a digest. For example:

```
DIGEST_TEXT: SELECT * FROM `performance_schema` . `users`
DIGEST: 0f70cec4015f2a346df4ac0e9475d9f1
```

By contrast, the following two statements would not have the same digest as, while the data values are the same, they call upon different tables.

```
SELECT * FROM customer1 WHERE age < 20
SELECT * FROM customer2 WHERE age < 20
```

The digest text is limited to 1024 bytes. Queries exceeding this limit are truncated with '…', meaning that long queries that would otherwise have different digests may share the same digest.

Digest information is used in a number of performance scheme tables. These include

- events_statements_current
- events_statements_history

- events_statements_history_long
- events_statements_summary_by_digest (a summary table by schema and digest)

Performance Schema Overview

The Performance Schema is a feature for monitoring server performance.

Introduction

It is implemented as a storage engine, and so will appear in the list of storage engines available.

```
SHOW ENGINES;
+--------------------+---------+----------------------------------+--------------+------+------------+
| Engine             | Support | Comment                          | Transactions | XA   | Savepoints |
+--------------------+---------+----------------------------------+--------------+------+------------+
| ...                |         |                                  |              |      |            |
| PERFORMANCE_SCHEMA | YES     | Performance Schema               | NO           | NO   | NO         |
| ...                |         |                                  |              |      |            |
+--------------------+---------+----------------------------------+--------------+------+------------+
```

However, `performance_schema` is not a regular storage engine for storing data, it's a mechanism for implementing the Performance Schema feature.

The storage engine contains a database called `performance_schema`, which in turn consists of a number of tables that can be queried with regular SQL statements, returning specific performance information.

```
USE performance_schema
```

```
SHOW TABLES;
+----------------------------------------------------+
| Tables_in_performance_schema                       |
+----------------------------------------------------+
| accounts                                           |
...
| users                                              |
+----------------------------------------------------+
80 rows in set (0.00 sec)
```

See List of Performance Schema Tables for a full list and links to detailed descriptions of each table. From MariaDB 10.5, there are 80 Performance Schema tables.

Activating the Performance Schema

The performance schema is disabled by default for performance reasons. You can check its current status by looking at the value of the performance_schema system variable.

```
SHOW VARIABLES LIKE 'performance_schema';
+--------------------+-------+
| Variable_name      | Value |
+--------------------+-------+
| performance_schema | ON    |
+--------------------+-------+
```

The performance schema cannot be activated at runtime - it must be set when the server starts by adding the following line in your `my.cnf` configuration file.

```
performance_schema=ON
```

From MariaDB 10.5, some memory is allocated dynamically, depending on load, number of connections, number of tables open etc.

Enabling the Performance Schema

You need to set up all consumers (starting collection of data) and instrumentations (what to collect):

```
UPDATE performance_schema.setup_consumers SET ENABLED = 'YES';
UPDATE performance_schema.setup_instruments SET ENABLED = 'YES', TIMED = 'YES';
```

You can decide what to enable/disable with `WHERE NAME like "%what_to_enable"`;
You can disable instrumentations by setting `ENABLED` to `"NO"`.

You can also do this in your my.cnf file.
The following enables all instrumentation of all stages (computation units) in MariaDB:

```
[mysqld]
performance_schema=ON
performance-schema-instrument='stage/%=ON'
performance-schema-consumer-events-stages-current=ON
performance-schema-consumer-events-stages-history=ON
performance-schema-consumer-events-stages-history-long=ON
```

Listing Performance Schema Variables

```
SHOW VARIABLES LIKE "perf%";
+----------------------------------------------------+-------+
| Variable_name                                      | Value |
+----------------------------------------------------+-------+
| performance_schema                                 | ON    |
...
| performance_schema_users_size                      | 100   |
+----------------------------------------------------+-------+
```

See Performance Schema System Variables for a full list of available system variables.

Note that the “consumer” events are not shown on this list, as they are only available as options, not as system variables, and they can only be enabled at startup.

Column Comments

From MariaDB 10.7.1, comments have been added to table columns in the Performance Schema. These can be viewed with, for example:

```
SELECT column_name, column_comment FROM information_schema.columns
  WHERE table_schema='performance_schema' AND table_name='file_instances';
...
*************************** 2. row ***************************
   column_name: EVENT_NAME
column_comment: Instrument name associated with the file.
*************************** 3. row ***************************
   column_name: OPEN_COUNT
column_comment: Open handles on the file. A value of greater than zero means
                that the file is currently open.
...
```

Performance Schema Status Variables

This page documents status variables related to the Performance Schema. See Server Status Variables for a complete list of status variables that can be viewed with SHOW STATUS.

See also the Full list of MariaDB options, system and status variables.

`Performance_schema_accounts_lost`

- Description: Number of times a row could not be added to the performance schema accounts table due to it being full. The global value can be flushed by FLUSH STATUS.
- Scope: Global, Session
- Data Type: `numeric`

`Performance_schema_cond_classes_lost`

- Description: Number of condition instruments that could not be loaded.
- Scope: Global, Session
- Data Type: `numeric`

`Performance_schema_cond_instances_lost`

- Description: Number of instances a condition object could not be created. The global value can be flushed by FLUSH STATUS.
- Scope: Global, Session
- Data Type: `numeric`

`Performance_schema_digest_lost`

- Description: The global value can be flushed by FLUSH STATUS.
- Scope: Global, Session
- Data Type: `numeric`

`Performance_schema_file_classes_lost`

- Description: Number of file instruments that could not be loaded.
- Scope: Global, Session
- Data Type: `numeric`

`Performance_schema_file_handles_lost`

- Description: Number of instances a file object could not be opened. The global value can be flushed by FLUSH STATUS.
- Scope: Global, Session
- Data Type: `numeric`

`Performance_schema_file_instances_lost`

- Description: Number of instances a file object could not be created. The global value can be flushed by FLUSH STATUS.

- Scope: Global, Session
- Data Type: `numeric`

`Performance_schema_hosts_lost`

- Description: Number of times a row could not be added to the performance schema hosts table due to it being full. The global value can be flushed by FLUSH STATUS.
- Scope: Global, Session
- Data Type: `numeric`

`Performance_schema_index_stat_lost`

- Description:
- Scope: Global, Session
- Data Type: `numeric`
- Introduced: MariaDB 10.5.2

`Performance_schema_locker_lost`

- Description: Number of events not recorded, due to either being recursive, or having a deeper nested events stack than the implementation limit. The global value can be flushed by FLUSH STATUS.
- Scope: Global, Session
- Data Type: `numeric`

`Performance_schema_memory_classes_lost`

- Description:
- Scope: Global, Session
- Data Type: `numeric`
- Introduced: MariaDB 10.5.2

`Performance_schema_metadata_lock_lost`

- Description:
- Scope: Global, Session
- Data Type: `numeric`
- Introduced: MariaDB 10.5.2

`Performance_schema_mutex_classes_lost`

- Description: Number of mutual exclusion instruments that could not be loaded.
- Scope: Global, Session
- Data Type: `numeric`

`Performance_schema_mutex_instances_lost`

- Description: Number of instances a mutual exclusion object could not be created. The global value can be flushed by FLUSH STATUS.
- Scope: Global, Session
- Data Type: `numeric`

`Performance_schema_nested_statement_lost`

- Description:

- Scope: Global, Session
- Data Type: `numeric`
- Introduced: MariaDB 10.5.2

`Performance_schema_prepared_statements_lost`

- Description:
- Scope: Global, Session
- Data Type: `numeric`
- Introduced: MariaDB 10.5.2

`Performance_schema_program_lost`

- Description:
- Scope: Global, Session
- Data Type: `numeric`
- Introduced: MariaDB 10.5.2

`Performance_schema_rwlock_classes_lost`

- Description: Number of read/write lock instruments that could not be loaded.
- Scope: Global, Session
- Data Type: `numeric`

`Performance_schema_rwlock_instances_lost`

- Description: Number of instances a read/write lock object could not be created. The global value can be flushed by FLUSH STATUS.
- Scope: Global, Session
- Data Type: `numeric`

`Performance_schema_session_connect_attrs_lost`

- Description: Number of connections for which connection attribute truncation has occurred. The global value can be flushed by FLUSH STATUS.
- Scope: Global, Session
- Data Type: `numeric`

`Performance_schema_socket_classes_lost`

- Description:
- Scope: Global, Session
- Data Type: `numeric`

`Performance_schema_socket_instances_lost`

- Description: Number of instances a socket object could not be created. The global value can be flushed by FLUSH STATUS.
- Scope: Global, Session
- Data Type: `numeric`

`Performance_schema_stage_classes_lost`

- Description: Number of stage event instruments that could not be loaded. The global value can be flushed by FLUSH STATUS.
- Scope: Global, Session
- Data Type: `numeric`

`Performance_schema_statement_classes_lost`

- Description: Number of statement instruments that could not be loaded. The global value can be flushed by FLUSH STATUS.
- Scope: Global, Session
- Data Type: `numeric`

`Performance_schema_table_handles_lost`

- Description: Number of instances a table object could not be opened. The global value can be flushed by FLUSH STATUS.
- Scope: Global, Session
- Data Type: `numeric`

`Performance_schema_table_instances_lost`

- Description: Number of instances a table object could not be created. The global value can be flushed by FLUSH STATUS.
- Scope: Global, Session
- Data Type: `numeric`

`Performance_schema_table_lock_stat_lost`

- Description:
- Scope: Global, Session
- Data Type: `numeric`
- Introduced: MariaDB 10.5.2

`Performance_schema_thread_classes_lost`

- Description: Number of thread instruments that could not be loaded.
- Scope: Global, Session
- Data Type: `numeric`

`Performance_schema_thread_instances_lost`

- Description: Number of instances thread object could not be created. The global value can be flushed by FLUSH STATUS.
- Scope: Global, Session
- Data Type: `numeric`

`Performance_schema_users_lost`

- Description: Number of times a row could not be added to the performance schema users table due to it being full. The global value can be flushed by FLUSH STATUS.
- Scope: Global, Session
- Data Type: `numeric`

Performance Schema System Variables

The following variables are used with MariaDB's Performance Schema. See Performance Schema Options for Performance Schema options that are not system variables. See Server System Variables for a complete list of system variables and instructions on setting them.

See also the Full list of MariaDB options, system and status variables.

`performance_schema`

- Description: If set to `1` (`0` is default), enables the Performance Schema
- Command line: `--performance-schema=#`
- Scope: Global
- Dynamic: No
- Data Type: `boolean`
- Default Value: `OFF`

`performance_schema_accounts_size`

- Description: Maximum number of rows in the performance_schema.accounts table. If set to 0, the Performance Schema will not store statistics in the accounts table. Use `-1` (the default) for automated sizing.
- Command line: `--performance-schema-accounts-size=#`
- Scope: Global
- Dynamic: No
- Data Type: `numeric`
- Default Value: `-1`
- Range: `-1` to `1048576`

`performance_schema_digests_size`

- Description: Maximum number of rows that can be stored in the events_statements_summary_by_digest table. `0` for disabling, `-1` (the default) for automated sizing.
- Command line: `--performance-schema-digests-size=#`
- Scope: Global
- Dynamic: No
- Data Type: `numeric`
- Default Value: `-1`
- Range: `-1` to `1048576`

`performance_schema_events_stages_history_long_size`

- Description: Number of rows in the events_stages_history_long table. `0` for disabling, `-1` (the default) for automated sizing.
- Command line: `--performance-schema-events-stages-history-long-size=#`
- Scope: Global
- Dynamic: No
- Data Type: `numeric`
- Default Value: `-1`
- Range: `-1` to `1048576`

`performance_schema_events_stages_history_size`

- Description: Number of rows per thread in the events_stages_history table. `0` for disabling, `-1` (the default) for automated sizing.
- Command line: `--performance-schema-events-stages-history-size=#`
- Scope: Global
- Dynamic: No
- Data Type: `numeric`
- Default Value: `-1`
- Range: `-1` to `1024`

`performance_schema_events_statements_history_long_size`

- Description: Number of rows in the events_statements_history_long table. `0` for disabling, `-1` (the default) for automated sizing.
- Command line: `--performance-schema-events-statements-history-long-size=#`
- Scope: Global
- Dynamic: No
- Data Type: `numeric`
- Default Value: `-1`
- Range: `-1` to `1048576`

`performance_schema_events_statements_history_size`

- Description: Number of rows per thread in the events_statements_history table. `0` for disabling, `-1` (the default) for automated sizing.
- Command line: `--performance-schema-events-statements-history-size=#`
- Scope: Global
- Dynamic: No
- Data Type: `numeric`
- Default Value: `-1`
- Range: `-1` to `1024`

`performance_schema_events_transactions_history_long_size`

- Description: Number of rows in events_transactions_history_long table. Use `0` to disable, `-1` for automated sizing.
- Command line: `--performance-schema-events-transactions-history-long-size=#`
- Scope: Global
- Dynamic: No
- Data Type: `numeric`
- Default Value: `-1`
- Range: `-1` to `1048576`
- Introduced: MariaDB 10.5.2

`performance_schema_events_transactions_history_size`

- Description:Number of rows per thread in events_transactions_history. Use 0 to disable, -1 for automated sizing.
- Command line: `--performance-schema-events-transactions-history-size=#`
- Scope: Global

- Dynamic: No
- Data Type: `numeric`
- Default Value: `-1`
- Range: `-1` to `1024`
- Introduced: MariaDB 10.5.2

`performance_schema_events_waits_history_long_size`

- Description: Number of rows contained in the events_waits_history_long table. `0` for disabling, `-1` (the default) for automated sizing.
- Command line: `--performance-schema-events-waits-history-long-size=#`
- Scope: Global
- Dynamic: No
- Data Type: `numeric`
- Default Value: `-1`
- Range: `-1` to `1048576`

`performance_schema_events_waits_history_size`

- Description: Number of rows per thread contained in the events_waits_history table. `0` for disabling, `-1` (the default) for automated sizing.
- Command line: `--performance-schema-events-waits-history-size=#`
- Scope: Global
- Dynamic: No
- Data Type: `numeric`
- Default Value: `-1`
- Range: `-1` to `1024`

`performance_schema_hosts_size`

- Description: Number of rows stored in the hosts table. If set to zero, no connection statistics are kept for the hosts table. `-1` (the default) for automated sizing.
- Command line: `--performance-schema-hosts-size=#`
- Scope: Global
- Dynamic: No
- Data Type: `numeric`
- Default Value: `-1`
- Range: `-1` to `1048576`

`performance_schema_max_cond_classes`

- Description: Specifies the maximum number of condition instruments.
- Command line: `--performance-schema-max-cond-classes=#`
- Scope: Global
- Dynamic: No
- Data Type: `numeric`
- Default Value: `90` (>= MariaDB 10.5.1), `80` (<= MariaDB 10.5.0)
- Range: `0` to `256`

`performance_schema_max_cond_instances`

- Description: Specifies the maximum number of instrumented condition objects. `0` for disabling, `-1` (the default) for automated sizing.
- Command line: `--performance-schema-max-cond-instances=#`
- Scope: Global
- Dynamic: No
- Data Type: `numeric`
- Default Value: `-1`
- Range: `-1` to `1048576`

`performance_schema_max_digest_length`

- Description: Maximum length considered for digest text, when stored in performance_schema tables.
- Command line: `--performance-schema-max-digest-length=#`
- Scope: Global
- Dynamic: No
- Data Type: `numeric`
- Default Value: `1024`
- Range: `0` to `1048576`

`performance_schema_max_file_classes`

- Description: Specifies the maximum number of file instruments.
- Command line: `--performance-schema-max-file-classes=#`
- Scope: Global
- Dynamic: No
- Data Type: `numeric`
- Default Value: `80` (>= MariaDB 10.5.2), `50` (<= MariaDB 10.5.1)
- Range: `0` to `256`

`performance_schema_max_file_handles`

- Description: Specifies the maximum number of opened file objects. Should always be higher than open_files_limit.
- Command line: `--performance-schema-max-file-handles=#`
- Scope: Global
- Dynamic: No
- Data Type: `numeric`
- Default Value: `32768`
- Range: `-1` to `32768`

`performance_schema_max_file_instances`

- Description: Specifies the maximum number of instrumented file objects. `0` for disabling, `-1` (the default) for automated sizing.
- Command line: `--performance-schema-max-file-instances=#`
- Scope: Global
- Dynamic: No
- Data Type: `numeric`

- Default Value: `-1`
- Range: `-1` to `1048576`

`performance_schema_max_index_stat`

- Description: Maximum number of index statistics for instrumented tables. Use 0 to disable, -1 for automated scaling.
- Command line: `--performance-schema-max-index-stat=#`
- Scope: Global
- Dynamic: No
- Data Type: `numeric`
- Default Value: `-1`
- Range: `-1` to `1048576`
- Introduced: MariaDB 10.5.2

`performance_schema_max_memory_classes`

- Description: Maximum number of memory pool instruments.
- Command line: `--performance-schema-max-memory-classes=#`
- Scope: Global
- Dynamic: No
- Data Type: `numeric`
- Default Value: `320`
- Range: `0` to `1024`
- Introduced: MariaDB 10.5.2

`performance_schema_max_metadata_locks`

- Description: Maximum number of Performance Schema metadata locks. Use 0 to disable, -1 for automated scaling.
- Command line: `--performance-schema-max-metadata-locks=#`
- Scope: Global
- Dynamic: No
- Data Type: `numeric`
- Default Value: `-1`
- Range: `-1` to `104857600`
- Introduced: MariaDB 10.5.2

`performance_schema_max_mutex_classes`

- Description: Specifies the maximum number of mutex instruments.
- Command line: `--performance-schema-max-mutex-classes=#`
- Scope: Global
- Dynamic: No
- Data Type: `numeric`
- Default Value: `210` (>= MariaDB 10.5.2), `200` (<= MariaDB 10.5.1)
- Range: `0` to `256`

`performance_schema_max_mutex_instances`

- Description: Specifies the maximum number of instrumented mutex instances. `0` for disabling, `-1` (the default) for automated sizing.
- Command line: `--performance-schema-max-mutex-instances=#`
- Scope: Global
- Dynamic: No
- Data Type: `numeric`
- Default Value: `-1`
- Range: `-1` to `104857600`

`performance_schema_max_prepared_statement_instances`

- Description: Maximum number of instrumented prepared statements. Use 0 to disable, -1 for automated scaling.
- Command line: `--performance-schema-max-prepared-statement-instances=#`
- Scope: Global
- Dynamic: No
- Data Type: `numeric`
- Default Value: `-1`
- Range: `-1` to `1048576`
- Introduced: MariaDB 10.5.2

`performance_schema_max_program_instances`

- Description: Maximum number of instrumented programs. Use 0 to disable, -1 for automated scaling.
- Command line: `--performance-schema-max-program-instances=#`
- Scope: Global
- Dynamic: No
- Data Type: `numeric`
- Default Value: `-1`
- Range: `-1` to `1048576`
- Introduced: MariaDB 10.5.2

`performance_schema_max_rwlock_classes`

- Description: Specifies the maximum number of rwlock instruments.
- Command line: `--performance-schema-max-rwlock-classes=#`
- Scope: Global
- Dynamic: No
- Data Type: `numeric`
- Default Value: `50` (>= MariaDB 10.5.2), `40` (<= MariaDB 10.5.1)
- Range: `0` to `256`

`performance_schema_max_rwlock_instances`

- Description: Specifies the maximum number of instrumented rwlock objects. `0` for disabling, `-1` (the default) for automated sizing.
- Command line: `--performance-schema-max-rwlock-instances=#`
- Scope: Global
- Dynamic: No

- Data Type: `numeric`
- Default Value: `-1`
- Range: `-1` to `104857600`

`performance_schema_max_socket_classes`

- Description: Specifies the maximum number of socket instruments.
- Command line: `--performance-schema-max-socket-classes=#`
- Scope: Global
- Dynamic: No
- Data Type: `numeric`
- Default Value: `10`
- Range: `0` to `256`

`performance_schema_max_socket_instances`

- Description: Specifies the maximum number of instrumented socket objects. `0` for disabling, `-1` (the default) for automated sizing.
- Command line: `--performance-schema-max-socket-instances=#`
- Scope: Global
- Dynamic: No
- Data Type: `numeric`
- Default Value: `-1`
- Range: `-1` to `1048576`

`performance_schema_max_sql_text_length`

- Description: Maximum length of displayed sql text.
- Command line: `--performance-schema-max-sql-text-length=#`
- Scope: Global
- Dynamic: No
- Data Type: `numeric`
- Default Value: `1024`
- Range: `0` to `1048576`
- Introduced: MariaDB 10.5.2

`performance_schema_max_stage_classes`

- Description: Specifies the maximum number of stage instruments.
- Command line: `--performance-schema-max-stage-classes=#`
- Scope: Global
- Dynamic: No
- Data Type: `numeric`
- Default Value: `160`
- Range: `0` to `256`

`performance_schema_max_statement_classes`

- Description: Specifies the maximum number of statement instruments. Automatically calculated at server build based on the number of available statements. Should be left as either autosized or disabled, as changing to any

positive value has no benefit and will most likely allocate unnecessary memory. Setting to zero disables all statement instrumentation, and no memory will be allocated for this purpose.

- Command line: `--performance-schema-max-statement-classes=#`
- Scope: Global
- Dynamic: No
- Data Type: `numeric`
- Default Value: Autosized (see description)
- Range: `0` to `256`

`performance_schema_max_statement_stack`

- Description: Number of rows per thread in EVENTS_STATEMENTS_CURRENT.
- Command line: `--performance-schema-max-statement-stack=#`
- Scope: Global
- Dynamic: No
- Data Type: `numeric`
- Default Value: `10`
- Range: `1` to `256`
- Introduced: MariaDB 10.5.2

`performance_schema_max_table_handles`

- Description: Specifies the maximum number of opened table objects. `0` for disabling, `-1` (the default) for automated sizing. See also the Performance Schema table_handles table.
- Command line: `--performance-schema-max-table-handles=#`
- Scope: Global
- Dynamic: No
- Data Type: `numeric`
- Default Value: `-1`
- Range: `-1` to `1048576`

`performance_schema_max_table_instances`

- Description: Specifies the maximum number of instrumented table objects. `0` for disabling, `-1` (the default) for automated sizing.
- Command line: `--performance-schema-max-table-instances=#`
- Scope: Global
- Dynamic: No
- Data Type: `numeric`
- Default Value: `-1`
- Range: `-1` to `1048576`

`performance_schema_max_table_lock_stat`

- Description: Maximum number of lock statistics for instrumented tables. Use 0 to disable, -1 for automated scaling.
- Command line: `--performance-schema-max-table-lock-stat=#`
- Scope: Global
- Dynamic: No

- Data Type: `numeric`
- Default Value: `-1`
- Range: `-1` to `1048576`
- Introduced: MariaDB 10.5.2

`performance_schema_max_thread_classes`

- Description: Specifies the maximum number of thread instruments.
- Command line: `--performance-schema-max-thread-classes=#`
- Scope: Global
- Dynamic: No
- Data Type: `numeric`
- Default Value: `50`
- Range: `0` to `256`

`performance_schema_max_thread_instances`

- Description: Specifies how many of the running server threads (see max_connections and max_delayed_threads) can be instrumented. Should be greater than the sum of max_connections and max_delayed_threads. `0` for disabling, `-1` (the default) for automated sizing.
- Command line: `--performance-schema-max-thread-instances=#`
- Scope: Global
- Dynamic: No
- Data Type: `numeric`
- Default Value: `-1`
- Range: `-1` to `1048576`

`performance_schema_session_connect_attrs_size`

- Description: Per thread preallocated memory for holding connection attribute strings. Incremented if the strings are larger than the reserved space. `0` for disabling, `-1` (the default) for automated sizing.
- Command line: `--performance-schema-session-connect-attrs-size=#`
- Scope: Global
- Dynamic: No
- Data Type: `numeric`
- Default Value: `-1`
- Range: `-1` to `1048576`

`performance_schema_setup_actors_size`

- Description: The maximum number of rows to store in the performance schema setup_actors table. `-1` (from MariaDB 10.5.2) denotes automated sizing.
- Command line: `--performance-schema-setup-actors-size=#`
- Scope: Global
- Dynamic: No
- Data Type: `numeric`
- Default Value: `-1` (>= MariaDB 10.5.2), `100` (<= MariaDB 10.5.1)
- Range: `-1` to `1024` (>= MariaDB 10.5.2), `0` to `1024` (<= MariaDB 10.5.1)

`performance_schema_setup_objects_size`

- Description: The maximum number of rows that can be stored in the performance schema setup_objects table. `-1` (from MariaDB 10.5.2) denotes automated sizing.
- Command line: `--performance-schema-setup-objects-size=#`
- Scope: Global
- Dynamic: No
- Data Type: `numeric`
- Default Value: `-1` (>= MariaDB 10.5.2), `100` (<= MariaDB 10.5.1)
- Range: `-1` to `1048576` (>= MariaDB 10.5.2), `0` to `1048576` (<= MariaDB 10.5.1)

`performance_schema_users_size`

- Description: Number of rows in the performance_schema.users table. If set to 0, the Performance Schema will not store connection statistics in the users table. `-1` (the default) for automated sizing.
- Command line: `--performance-schema-users-size=#`
- Scope: Global
- Dynamic: No
- Data Type: `numeric`
- Default Value: `-1`
- Range: `-1` to `1048576`

List of Performance Schema Tables

Below is a list of all Performance Schema tables as well as a brief description of each of them.

Table	Description
accounts	Client account connection statistics.
cond_instances	Synchronization object instances.
events_stages_current	Current stage events.
events_stages_history	Ten most recent stage events per thread.
events_stages_history_long	Ten thousand most recent stage events.
events_stages_summary_by_account_by_event_name	Summarized stage events per account and event name.
events_stages_summary_by_host_by_event_name	Summarized stage events per host and event name.
events_stages_summary_by_thread_by_event_name	Summarized stage events per thread and event name.
events_stages_summary_by_user_by_event_name	Summarized stage events per user name and event name.
events_stages_summary_global_by_event_name	Summarized stage events per event name.
events_statements_current	Current statement events.
events_statements_history	Ten most recent events per thread.
events_statements_history_long	Ten thousand most recent stage events.
events_statements_summary_by_account_by_event_name	Summarized statement events per account and event name.
events_statements_summary_by_digest	Summarized statement events by scheme and digest.
events_statements_summary_by_host_by_event_name	Summarized statement events by host and event name.
events_statements_summary_by_program	Events for a particular stored program.
events_statements_summary_by_thread_by_event_name	Summarized statement events by thread and event name.
events_statements_summary_by_user_by_event_name	Summarized statement events by user and event name.
events_statements_summary_global_by_event_name	Summarized statement events by event name.
events_transactions_current	Current transaction events for each thread.
events_transactions_history	Most recent completed transaction events for each thread.

Table	Description
events_transactions_history_long	Most recent completed transaction events that have ended globally.
events_transactions_summary_by_account_by_event_name	Transaction events aggregated by account and event.
events_transactions_summary_by_host_by_event_name	Transaction events aggregated by host and event..
events_transactions_summary_by_thread_by_event_name	Transaction events aggregated by thread and event..
events_transactions_summary_by_user_by_event_name	Transaction events aggregated by user and event..
events_transactions_summary_global_by_event_name	Transaction events aggregated by event name.
events_waits_current	Current wait events.
events_waits_history	Ten most recent wait events per thread.
events_waits_history_long	Ten thousand most recent wait events per thread.
events_waits_summary_by_account_by_event_name	Summarized wait events by account and event name.
events_waits_summary_by_host_by_event_name	Summarized wait events by host and event name.
events_waits_summary_by_instance	Summarized wait events by instance.
events_waits_summary_by_thread_by_event_name	Summarized wait events by thread and event name.
events_waits_summary_by_user_by_event_name	Summarized wait events by user and event name.
events_waits_summary_global_by_event_name	Summarized wait events by event name.
file_instances	Seen files.
file_summary_by_event_name	File events summarized by event name.
file_summary_by_instance	File events summarized by instance.
global_status	Global status variables and values.
host_cache	Host and IP information.
hosts	Connections by host.
memory_summary_by_account_by_event_name	Memory usage statistics aggregated by account and event.
memory_summary_by_host_by_event_name	Memory usage statistics aggregated by host. and event.
memory_summary_by_thread_by_event_name	Memory usage statistics aggregated by thread and event..
memory_summary_by_user_by_event_name	Memory usage statistics aggregated by user and event..
memory_summary_global_by_event_name	Memory usage statistics aggregated by event.
metadata_locks	Metadata locks.
mutex_instances	Seen mutexes.
objects_summary_global_by_type	Object wait events.
performance_timers	Available event timers.
prepared_statements_instances	Aggregate statistics of prepared statements.
replication_applier_configuration	Configuration settings affecting replica transactions.
replication_applier_status	General transaction execution status on the replica.
replication_applier_status_by_coordinator	Coordinator thread specific information.
replication_applier_status_by_worker	Replica worker thread specific information.
replication_connection_configuration	Rreplica's configuration settings used for connecting to the primary.
rwlock_instances	Seen read-write locks.
session_account_connect_attrs	Current session connection attributes.
session_connect_attrs	All session connection attributes.

Table	Description
session_status	Session status variables and values.
setup_actors	Details on foreground thread monitoring.
setup_consumers	Consumers for which event information is stored.
setup_instruments	Instrumented objects for which events are collected.
setup_objects	Objects to be monitored.
setup_timers	Currently selected event timers.
socket_instances	Active connections.
socket_summary_by_event_name	Timer and byte count statistics by socket instrument.
socket_summary_by_instance	Timer and byte count statistics by socket instance.
status_by_account	Status variable info by host/user account.
status_by_host	Status variable info by host.
status_by_thread	Status variable info about active foreground threads.
status_by_user	Status variable info by user.
table_handles	Table lock information.
table_io_waits_summary_by_index_usage	Aggregate table I/O wait events by index.
table_io_waits_summary_by_table	Aggregate table I/O wait events by table.
table_lock_waits_summary_by_table	Aggregate table lock wait events by table.
threads	Server thread information.
user_variables_by_thread	User-defined variables by thread.
users	Connection statistics by user.

This page is licensed: CC BY-SA / Gnu FDL

Performance Schema accounts Table

Description

Each account that connects to the server is stored as a row in the accounts table, along with current and total connections.

The table size is determined at startup by the value of the performance_schema_accounts_size system variable. If this is set to 0, account statistics will be disabled.

Column	Description
USER	The connection's client user name for the connection, or NULL if an internal thread.
HOST	The connection client's host name, or NULL if an internal thread.
CURRENT_CONNECTIONS	Current connections for the account.
TOTAL_CONNECTIONS	Total connections for the account.

The `USER` and `HOST` values shown here are the username and host used for user connections, not the patterns used to check permissions.

Example

```
SELECT * FROM performance_schema.accounts;
+------------------+-----------+---------------------+-------------------+
| USER             | HOST      | CURRENT_CONNECTIONS | TOTAL_CONNECTIONS |
+------------------+-----------+---------------------+-------------------+
| root             | localhost |                   1 |                 2 |
| NULL             | NULL      |                  20 |                23 |
| debian-sys-maint | localhost |                   0 |                35 |
+------------------+-----------+---------------------+-------------------+
```

Performance Schema cond_instances Table

Description

The `cond_instances` table lists all conditions while the server is executing. A condition, or instrumented condition object, is an internal code mechanism used for signalling that a specific event has occurred so that any threads waiting for this condition can continue.

The maximum number of conditions stored in the performance schema is determined by the performance_schema_max_cond_instances system variable.

Column	Description
NAME	Client user name for the connection, or NULL if an internal thread.
OBJECT_INSTANCE_BEGIN	Address in memory of the instrumented condition.

This page is licensed: CC BY-SA / Gnu FDL

Performance Schema events_stages_current Table

The `events_stages_current` table contains current stage events, with each row being a record of a thread and its most recent stage event.

The table contains the following columns:

Column	Description
THREAD_ID	Thread associated with the event. Together with EVENT_ID uniquely identifies the row.
EVENT_ID	Thread's current event number at the start of the event. Together with THREAD_ID uniquely identifies the row.
END_EVENT_ID	NULL when the event starts, set to the thread's current event number at the end of the event.
EVENT_NAME	Event instrument name and a NAME from the setup_instruments table
SOURCE	Name and line number of the source file containing the instrumented code that produced the event.
TIMER_START	Value in picoseconds when the event timing started or NULL if timing is not collected. Relative to the server start, not to the epoch, so cannot directly be converted to a timestamp.
TIMER_END	Value in picoseconds when the event timing ended, or NULL if the event has not ended or timing is not collected. Relative to the server start, not to the epoch, so cannot directly be converted to a timestamp.
TIMER_WAIT	Value in picoseconds of the event's duration or NULL if the event has not ended or timing is not collected.
NESTING_EVENT_ID	EVENT_ID of event within which this event nests.
NESTING_EVENT_TYPE	Nesting event type. One of transaction, statement, stage or wait.

It is possible to empty this table with a `TRUNCATE TABLE` statement.

The related tables, events_stages_history and events_stages_history_long derive their values from the current events.

This page is licensed: CC BY-SA / Gnu FDL

Performance Schema events_stages_history Table

The `events_stages_history` table by default contains the ten most recent completed stage events per thread. This number can be adjusted by setting the performance_schema_events_stages_history_size system variable when the server starts up.

The table structure is identical to the events_stage_current table structure, and contains the following columns:

Column	Description
THREAD_ID	Thread associated with the event. Together with EVENT_ID uniquely identifies the row.
EVENT_ID	Thread's current event number at the start of the event. Together with THREAD_ID uniquely identifies the row.
END_EVENT_ID	NULL when the event starts, set to the thread's current event number at the end of the event.
EVENT_NAME	Event instrument name and a NAME from the setup_instruments table
SOURCE	Name and line number of the source file containing the instrumented code that produced the event.
TIMER_START	Value in picoseconds when the event timing started or NULL if timing is not collected. Relative to the server start, not to the epoch, so cannot directly be converted to a timestamp.
TIMER_END	Value in picoseconds when the event timing ended, or NULL if timing is not collected. Relative to the server start, not to the epoch, so cannot directly be converted to a timestamp.
TIMER_WAIT	Value in picoseconds of the event's duration or NULL if timing is not collected.
NESTING_EVENT_ID	EVENT_ID of event within which this event nests.
NESTING_EVENT_TYPE	Nesting event type. One of transaction, statement, stage or wait.

It is possible to empty this table with a `TRUNCATE TABLE` statement.

events_stages_current and events_stages_history_long are related tables.

This page is licensed: CC BY-SA / Gnu FDL

Performance Schema events_stages_history_long Table

The `events_stages_history_long` table by default contains the ten thousand most recent completed stage events. This number can be adjusted by setting the performance_schema_events_stages_history_long_size system variable when the server starts up.

The table structure is identical to the `events_stage_current` table structure, and contains the following columns:

Column	Description
THREAD_ID	Thread associated with the event. Together with EVENT_ID uniquely identifies the row.
EVENT_ID	Thread's current event number at the start of the event. Together with THREAD_ID uniquely identifies the row.
END_EVENT_ID	NULL when the event starts, set to the thread's current event number at the end of the event.
EVENT_NAME	Event instrument name and a NAME from the setup_instruments table
SOURCE	Name and line number of the source file containing the instrumented code that produced the event.
TIMER_START	Value in picoseconds when the event timing started or NULL if timing is not collected. Relative to the server start, not to the epoch, so cannot directly be converted to a timestamp.

Column	Description
TIMER_END	Value in picoseconds when the event timing ended, or NULL if timing is not collected. Relative to the server start, not to the epoch, so cannot directly be converted to a timestamp.
TIMER_WAIT	Value in picoseconds of the event's duration or NULL if timing is not collected.
NESTING_EVENT_ID	EVENT_ID of event within which this event nests.
NESTING_EVENT_TYPE	Nesting event type. One of transaction, statement, stage or wait.

It is possible to empty this table with a `TRUNCATE TABLE` statement.

events_stages_current and events_stages_history are related tables.

This page is licensed: CC BY-SA / Gnu FDL

Performance Schema events_stages_summary_by_account_by_event_name Table

The table lists stage events, summarized by account and event name.

It contains the following columns:

Column	Description
USER	User. Used together with HOST and EVENT_NAME for grouping events.
HOST	Host. Used together with USER and EVENT_NAME for grouping events.
EVENT_NAME	Event name. Used together with USER and HOST for grouping events.
COUNT_STAR	Number of summarized events, which includes all timed and untimed events.
SUM_TIMER_WAIT	Total wait time of the timed summarized events.
MIN_TIMER_WAIT	Minimum wait time of the timed summarized events.
AVG_TIMER_WAIT	Average wait time of the timed summarized events.
MAX_TIMER_WAIT	Maximum wait time of the timed summarized events.

Example

```
SELECT * FROM events_stages_summary_by_account_by_event_name\G
...
*************************** 325. row ***************************
          USER: NULL
          HOST: NULL
    EVENT_NAME: stage/sql/Waiting for event metadata lock
    COUNT_STAR: 0
SUM_TIMER_WAIT: 0
MIN_TIMER_WAIT: 0
AVG_TIMER_WAIT: 0
MAX_TIMER_WAIT: 0
*************************** 326. row ***************************
          USER: NULL
          HOST: NULL
    EVENT_NAME: stage/sql/Waiting for commit lock
    COUNT_STAR: 0
SUM_TIMER_WAIT: 0
MIN_TIMER_WAIT: 0
AVG_TIMER_WAIT: 0
MAX_TIMER_WAIT: 0
*************************** 327. row ***************************
          USER: NULL
          HOST: NULL
    EVENT_NAME: stage/aria/Waiting for a resource
    COUNT_STAR: 0
SUM_TIMER_WAIT: 0
MIN_TIMER_WAIT: 0
AVG_TIMER_WAIT: 0
MAX_TIMER_WAIT: 0
```

This page is licensed: CC BY-SA / Gnu FDL

Performance Schema events_stages_summary_by_host_by_event_name Table

The table lists stage events, summarized by host and event name.

It contains the following columns:

Column	Description
HOST	Host. Used together with EVENT_NAME for grouping events.
EVENT_NAME	Event name. Used together with HOST for grouping events.
COUNT_STAR	Number of summarized events, which includes all timed and untimed events.
SUM_TIMER_WAIT	Total wait time of the timed summarized events.
MIN_TIMER_WAIT	Minimum wait time of the timed summarized events.
AVG_TIMER_WAIT	Average wait time of the timed summarized events.
MAX_TIMER_WAIT	Maximum wait time of the timed summarized events.

Example

```
SELECT * FROM events_stages_summary_by_host_by_event_name\G
...
*************************** 216. row ***************************
          HOST: NULL
    EVENT_NAME: stage/sql/Waiting for event metadata lock
    COUNT_STAR: 0
SUM_TIMER_WAIT: 0
MIN_TIMER_WAIT: 0
AVG_TIMER_WAIT: 0
MAX_TIMER_WAIT: 0
*************************** 217. row ***************************
          HOST: NULL
    EVENT_NAME: stage/sql/Waiting for commit lock
    COUNT_STAR: 0
SUM_TIMER_WAIT: 0
MIN_TIMER_WAIT: 0
AVG_TIMER_WAIT: 0
MAX_TIMER_WAIT: 0
*************************** 218. row ***************************
          HOST: NULL
    EVENT_NAME: stage/aria/Waiting for a resource
    COUNT_STAR: 0
SUM_TIMER_WAIT: 0
MIN_TIMER_WAIT: 0
AVG_TIMER_WAIT: 0
MAX_TIMER_WAIT: 0
```

Performance Schema events_stages_summary_by_thread_by_event_name Table

The table lists stage events, summarized by thread and event name.

It contains the following columns:

Column	Description
THREAD_ID	Thread associated with the event. Together with EVENT_NAME uniquely identifies the row.
EVENT_NAME	Event name. Used together with THREAD_ID for grouping events.
COUNT_STAR	Number of summarized events, which includes all timed and untimed events.
SUM_TIMER_WAIT	Total wait time of the timed summarized events.
MIN_TIMER_WAIT	Minimum wait time of the timed summarized events.
AVG_TIMER_WAIT	Average wait time of the timed summarized events.
MAX_TIMER_WAIT	Maximum wait time of the timed summarized events.

Example

```
SELECT * FROM events_stages_summary_by_thread_by_event_name\G
...
*************************** 2287. row ***************************
     THREAD_ID: 64
    EVENT_NAME: stage/sql/Waiting for event metadata lock
    COUNT_STAR: 0
SUM_TIMER_WAIT: 0
MIN_TIMER_WAIT: 0
AVG_TIMER_WAIT: 0
MAX_TIMER_WAIT: 0
*************************** 2288. row ***************************
     THREAD_ID: 64
    EVENT_NAME: stage/sql/Waiting for commit lock
    COUNT_STAR: 0
SUM_TIMER_WAIT: 0
MIN_TIMER_WAIT: 0
AVG_TIMER_WAIT: 0
MAX_TIMER_WAIT: 0
*************************** 2289. row ***************************
     THREAD_ID: 64
    EVENT_NAME: stage/aria/Waiting for a resource
    COUNT_STAR: 0
SUM_TIMER_WAIT: 0
MIN_TIMER_WAIT: 0
AVG_TIMER_WAIT: 0
MAX_TIMER_WAIT: 0
```

This page is licensed: CC BY-SA / Gnu FDL

Performance Schema events_stages_summary_by_user_by_event_name Table

The table lists stage events, summarized by user and event name.

It contains the following columns:

Column	Description
USER	User. Used together with EVENT_NAME for grouping events.
EVENT_NAME	Event name. Used together with USER for grouping events.
COUNT_STAR	Number of summarized events, which includes all timed and untimed events.
SUM_TIMER_WAIT	Total wait time of the timed summarized events.
MIN_TIMER_WAIT	Minimum wait time of the timed summarized events.
AVG_TIMER_WAIT	Average wait time of the timed summarized events.
MAX_TIMER_WAIT	Maximum wait time of the timed summarized events.

Example

```
SELECT * FROM events_stages_summary_by_user_by_event_name\G
...
*************************** 325. row ***************************
          USER: NULL
    EVENT_NAME: stage/sql/Waiting for event metadata lock
    COUNT_STAR: 0

Performance Schema events_stages_summary_global_by_event_name Table

The table lists stage events, summarized by thread and event name.

It contains the following columns:

Column	Description
EVENT_NAME	Event name.
COUNT_STAR	Number of summarized events, which includes all timed and untimed events.
SUM_TIMER_WAIT	Total wait time of the timed summarized events.
MIN_TIMER_WAIT	Minimum wait time of the timed summarized events.
AVG_TIMER_WAIT	Average wait time of the timed summarized events.
MAX_TIMER_WAIT	Maximum wait time of the timed summarized events.

Example

```
SELECT * FROM events_stages_summary_global_by_event_name\G
...
*************************** 106. row ***************************
    EVENT_NAME: stage/sql/Waiting for trigger metadata lock
    COUNT_STAR: 0
SUM_TIMER_WAIT: 0
MIN_TIMER_WAIT: 0
AVG_TIMER_WAIT: 0
MAX_TIMER_WAIT: 0
*************************** 107. row ***************************
    EVENT_NAME: stage/sql/Waiting for event metadata lock
    COUNT_STAR: 0
SUM_TIMER_WAIT: 0
MIN_TIMER_WAIT: 0
AVG_TIMER_WAIT: 0
MAX_TIMER_WAIT: 0
*************************** 108. row ***************************
    EVENT_NAME: stage/sql/Waiting for commit lock
    COUNT_STAR: 0
SUM_TIMER_WAIT: 0
MIN_TIMER_WAIT: 0
AVG_TIMER_WAIT: 0
MAX_TIMER_WAIT: 0
*************************** 109. row ***************************
    EVENT_NAME: stage/aria/Waiting for a resource
    COUNT_STAR: 0
SUM_TIMER_WAIT: 0
MIN_TIMER_WAIT: 0
AVG_TIMER_WAIT: 0
MAX_TIMER_WAIT: 0
```

Performance Schema events_statements_current Table

The `events_statements_current` table contains current statement events, with each row being a record of a thread and its most recent statement event.

The table contains the following columns:

Column	Description
THREAD_ID	Thread associated with the event. Together with EVENT_ID uniquely identifies the row.
EVENT_ID	Thread's current event number at the start of the event. Together with THREAD_ID uniquely identifies the row.
END_EVENT_ID	NULL when the event starts, set to the thread's current event number at the end of the event.
EVENT_NAME	Event instrument name and a NAME from the setup_instruments table
SOURCE	Name and line number of the source file containing the instrumented code that produced the event.
TIMER_START	Value in picoseconds when the event timing started or NULL if timing is not collected. Relative to the server start, not to the epoch, so cannot directly be converted to a timestamp.
TIMER_END	Value in picoseconds when the event timing ended, or NULL if the event has not ended or timing is not collected. Relative to the server start, not to the epoch, so cannot directly be converted to a timestamp.
TIMER_WAIT	Value in picoseconds of the event's duration or NULL if the event has not ended or timing is not collected.
LOCK_TIME	Time in picoseconds spent waiting for locks. The time is calculated in microseconds but stored in picoseconds for compatibility with other timings.
SQL_TEXT	The SQL statement, or NULL if the command is not associated with an SQL statement.
DIGEST	Statement digest.
DIGEST_TEXT	Statement digest text.

Column	Description
CURRENT_SCHEMA	Statement's default database for the statement, or NULL if there was none.
OBJECT_SCHEMA	Reserved, currently NULL
OBJECT_NAME	Reserved, currently NULL
OBJECT_TYPE	Reserved, currently NULL
OBJECT_INSTANCE_BEGIN	Address in memory of the statement object.
MYSQL_ERRNO	Error code. See MariaDB Error Codes for a full list.
RETURNED_SQLSTATE	The SQLSTATE value.
MESSAGE_TEXT	Statement error message. See MariaDB Error Codes.
ERRORS	0 if SQLSTATE signifies completion (starting with 00) or warning (01), otherwise 1.
WARNINGS	Number of warnings from the diagnostics area.
ROWS_AFFECTED	Number of rows affected the statement affected.
ROWS_SENT	Number of rows returned.
ROWS_EXAMINED	Number of rows read during the statement's execution.
CREATED_TMP_DISK_TABLES	Number of on-disk temp tables created by the statement.
CREATED_TMP_TABLES	Number of temp tables created by the statement.
SELECT_FULL_JOIN	Number of joins performed by the statement which did not use an index.
SELECT_FULL_RANGE_JOIN	Number of joins performed by the statement which used a range search of the first table.
SELECT_RANGE	Number of joins performed by the statement which used a range of the first table.
SELECT_RANGE_CHECK	Number of joins without keys performed by the statement that check for key usage after each row.
SELECT_SCAN	Number of joins performed by the statement which used a full scan of the first table.
SORT_MERGE_PASSES	Number of merges passes by the sort algorithm performed by the statement. If too high, you may need to increase the sort_buffer_size.
SORT_RANGE	Number of sorts performed by the statement which used a range.
SORT_ROWS	Number of rows sorted by the statement.
SORT_SCAN	Number of sorts performed by the statement which used a full table scan.
NO_INDEX_USED	0 if the statement performed a table scan with an index, 1 if without an index.
NO_GOOD_INDEX_USED	0 if a good index was found for the statement, 1 if no good index was found. See the Range checked for each record description in the EXPLAIN article.
NESTING_EVENT_ID	Reserved, currently NULL.
NESTING_EVENT_TYPE	Reserved, currently NULL.

It is possible to empty this table with a `TRUNCATE TABLE` statement.

The related tables, events_statements_history and events_statements_history_long derive their values from the current events table.

Performance Schema events_statements_history Table

The `events_statements_history` table by default contains the ten most recent completed statement events per thread. This number can be adjusted by setting the performance_schema_events_statements_history_size system variable when the server starts up.

The table structure is identical to the events_statements_current table structure, and contains the following columns:

The table contains the following columns:

Column	Description
THREAD_ID	Thread associated with the event. Together with EVENT_ID uniquely identifies the row.
EVENT_ID	Thread's current event number at the start of the event. Together with THREAD_ID uniquely identifies the row.
END_EVENT_ID	NULL when the event starts, set to the thread's current event number at the end of the event.
EVENT_NAME	Event instrument name and a NAME from the setup_instruments table
SOURCE	Name and line number of the source file containing the instrumented code that produced the event.
TIMER_START	Value in picoseconds when the event timing started or NULL if timing is not collected. Relative to the server start, not to the epoch, so cannot directly be converted to a timestamp.
TIMER_END	Value in picoseconds when the event timing ended, or NULL if timing is not collected. Relative to the server start, not to the epoch, so cannot directly be converted to a timestamp.
TIMER_WAIT	Value in picoseconds of the event's duration or NULL if timing is not collected.
LOCK_TIME	Time in picoseconds spent waiting for locks. The time is calculated in microseconds but stored in picoseconds for compatibility with other timings.
SQL_TEXT	The SQL statement, or NULL if the command is not associated with an SQL statement.
DIGEST	Statement digest.
DIGEST_TEXT	Statement digest text.
CURRENT_SCHEMA	Statement's default database for the statement, or NULL if there was none.
OBJECT_SCHEMA	Reserved, currently NULL
OBJECT_NAME	Reserved, currently NULL
OBJECT_TYPE	Reserved, currently NULL
OBJECT_INSTANCE_BEGIN	Address in memory of the statement object.
MYSQL_ERRNO	Error code. See MariaDB Error Codes for a full list.
RETURNED_SQLSTATE	The SQLSTATE value.
MESSAGE_TEXT	Statement error message. See MariaDB Error Codes.
ERRORS	0 if SQLSTATE signifies completion (starting with 00) or warning (01), otherwise 1.
WARNINGS	Number of warnings from the diagnostics area.
ROWS_AFFECTED	Number of rows affected the statement affected.
ROWS_SENT	Number of rows returned.
ROWS_EXAMINED	Number of rows read during the statement's execution.
CREATED_TMP_DISK_TABLES	Number of on-disk temp tables created by the statement.

Column	Description
CREATED_TMP_TABLES	Number of temp tables created by the statement.
SELECT_FULL_JOIN	Number of joins performed by the statement which did not use an index.
SELECT_FULL_RANGE_JOIN	Number of joins performed by the statement which used a range search of the first table.
SELECT_RANGE	Number of joins performed by the statement which used a range of the first table.
SELECT_RANGE_CHECK	Number of joins without keys performed by the statement that check for key usage after each row.
SELECT_SCAN	Number of joins performed by the statement which used a full scan of the first table.
SORT_MERGE_PASSES	Number of merge passes by the sort algorithm performed by the statement. If too high, you may need to increase the sort_buffer_size.
SORT_RANGE	Number of sorts performed by the statement which used a range.
SORT_ROWS	Number of rows sorted by the statement.
SORT_SCAN	Number of sorts performed by the statement which used a full table scan.
NO_INDEX_USED	0 if the statement performed a table scan with an index, 1 if without an index.
NO_GOOD_INDEX_USED	0 if a good index was found for the statement, 1 if no good index was found. See the Range checked for each record description in the EXPLAIN article.
NESTING_EVENT_ID	Reserved, currently NULL.
NESTING_EVENT_TYPE	Reserved, currently NULL.

It is possible to empty this table with a `TRUNCATE TABLE` statement.

events_statements_current and events_statements_history_long are related tables.

Performance Schema events_statements_history_long Table

The `events_statements_history_long` table by default contains the ten thousand most recent completed statement events. This number can be adjusted by setting the performance_schema_events_statements_history_long_size system variable when the server starts up.

The table structure is identical to the events_statements_current table structure, and contains the following columns:

Column	Description
THREAD_ID	Thread associated with the event. Together with EVENT_ID uniquely identifies the row.
EVENT_ID	Thread's current event number at the start of the event. Together with THREAD_ID uniquely identifies the row.
END_EVENT_ID	NULL when the event starts, set to the thread's current event number at the end of the event.
EVENT_NAME	Event instrument name and a NAME from the setup_instruments table
SOURCE	Name and line number of the source file containing the instrumented code that produced the event.
TIMER_START	Value in picoseconds when the event timing started or NULL if timing is not collected. Relative to the server start, not to the epoch, so cannot directly be converted to a timestamp.
TIMER_END	Value in picoseconds when the event timing ended, or NULL if timing is not collected. Relative to the server start, not to the epoch, so cannot directly be converted to a timestamp.
TIMER_WAIT	Value in picoseconds of the event's duration or NULL if timing is not collected.

Column	Description
LOCK_TIME	Time in picoseconds spent waiting for locks. The time is calculated in microseconds but stored in picoseconds for compatibility with other timings.
SQL_TEXT	The SQL statement, or NULL if the command is not associated with an SQL statement.
DIGEST	Statement digest.
DIGEST_TEXT	Statement digest text.
CURRENT_SCHEMA	Statement's default database for the statement, or NULL if there was none.
OBJECT_SCHEMA	Reserved, currently NULL
OBJECT_NAME	Reserved, currently NULL
OBJECT_TYPE	Reserved, currently NULL
OBJECT_INSTANCE_BEGIN	Address in memory of the statement object.
MYSQL_ERRNO	Error code. See MariaDB Error Codes for a full list.
RETURNED_SQLSTATE	The SQLSTATE value.
MESSAGE_TEXT	Statement error message. See MariaDB Error Codes.
ERRORS	0 if SQLSTATE signifies completion (starting with 00) or warning (01), otherwise 1.
WARNINGS	Number of warnings from the diagnostics area.
ROWS_AFFECTED	Number of rows affected the statement affected.
ROWS_SENT	Number of rows returned.
ROWS_EXAMINED	Number of rows read during the statement's execution.
CREATED_TMP_DISK_TABLES	Number of on-disk temp tables created by the statement.
CREATED_TMP_TABLES	Number of temp tables created by the statement.
SELECT_FULL_JOIN	Number of joins performed by the statement which did not use an index.
SELECT_FULL_RANGE_JOIN	Number of joins performed by the statement which used a range search of the first table.
SELECT_RANGE	Number of joins performed by the statement which used a range of the first table.
SELECT_RANGE_CHECK	Number of joins without keys performed by the statement that check for key usage after each row.
SELECT_SCAN	Number of joins performed by the statement which used a full scan of the first table.
SORT_MERGE_PASSES	Number of merge passes by the sort algorithm performed by the statement. If too high, you may need to increase the sort_buffer_size.
SORT_RANGE	Number of sorts performed by the statement which used a range.
SORT_ROWS	Number of rows sorted by the statement.
SORT_SCAN	Number of sorts performed by the statement which used a full table scan.
NO_INDEX_USED	0 if the statement performed a table scan with an index, 1 if without an index.
NO_GOOD_INDEX_USED	0 if a good index was found for the statement, 1 if no good index was found. See the Range checked for each record description in the EXPLAIN article.
NESTING_EVENT_ID	Reserved, currently NULL.
NESTING_EVENT_TYPE	Reserved, currently NULL.

It is possible to empty this table with a `TRUNCATE TABLE` statement.

events_statements_current and events_statements_history are related tables.

Performance Schema events_statements_summary_by_account_by_event_name Table

The Performance Schema events_statements_summary_by_account_by_event_name table contains statement events summarized by account and event name. It contains the following columns:

Column	Description
USER	User. Used together with HOST and EVENT_NAME for grouping events.
HOST	Host. Used together with USER and EVENT_NAME for grouping events.
EVENT_NAME	Event name. Used together with USER and HOST for grouping events.
COUNT_STAR	Number of summarized events
SUM_TIMER_WAIT	Total wait time of the summarized events that are timed.
MIN_TIMER_WAIT	Minimum wait time of the summarized events that are timed.
AVG_TIMER_WAIT	Average wait time of the summarized events that are timed.
MAX_TIMER_WAIT	Maximum wait time of the summarized events that are timed.
SUM_LOCK_TIME	Sum of the LOCK_TIME column in the events_statements_current table.
SUM_ERRORS	Sum of the ERRORS column in the events_statements_current table.
SUM_WARNINGS	Sum of the WARNINGS column in the events_statements_current table.
SUM_ROWS_AFFECTED	Sum of the ROWS_AFFECTED column in the events_statements_current table.
SUM_ROWS_SENT	Sum of the ROWS_SENT column in the events_statements_current table.
SUM_ROWS_EXAMINED	Sum of the ROWS_EXAMINED column in the events_statements_current table.
SUM_CREATED_TMP_DISK_TABLES	Sum of the CREATED_TMP_DISK_TABLES column in the events_statements_current table.
SUM_CREATED_TMP_TABLES	Sum of the CREATED_TMP_TABLES column in the events_statements_current table.
SUM_SELECT_FULL_JOIN	Sum of the SELECT_FULL_JOIN column in the events_statements_current table.
SUM_SELECT_FULL_RANGE_JOIN	Sum of the SELECT_FULL_RANGE_JOIN column in the events_statements_current table.
SUM_SELECT_RANGE	Sum of the SELECT_RANGE column in the events_statements_current table.
SUM_SELECT_RANGE_CHECK	Sum of the SELECT_RANGE_CHECK column in the events_statements_current table.
SUM_SELECT_SCAN	Sum of the SELECT_SCAN column in the events_statements_current table.
SUM_SORT_MERGE_PASSES	Sum of the SORT_MERGE_PASSES column in the events_statements_current table.
SUM_SORT_RANGE	Sum of the SORT_RANGE column in the events_statements_current table.
SUM_SORT_ROWS	Sum of the SORT_ROWS column in the events_statements_current table.
SUM_SORT_SCAN	Sum of the SORT_SCAN column in the events_statements_current table.
SUM_NO_INDEX_USED	Sum of the NO_INDEX_USED column in the events_statements_current table.
SUM_NO_GOOD_INDEX_USED	Sum of the NO_GOOD_INDEX_USED column in the events_statements_current table.

The `*_TIMER_WAIT` columns only calculate results for timed events, as non-timed events have a `NULL` wait time.

Example

```
SELECT * FROM events_statements_summary_by_account_by_event_name\G
...
*************************** 521. row ***************************
                    USER: NULL
                    HOST: NULL

Performance Schema events_statements_summary_by_digest Table

The Performance Schema digest is a hashed, normalized form of a statement with the specific data values removed. It allows statistics to be gathered for similar kinds of statements.

The Performance Schema `events_statements_summary_by_digest` table records statement events summarized by schema and digest. It contains the following columns:

Column	Description
SCHEMA NAME	Database name. Records are summarised together with DIGEST.
DIGEST	Performance Schema digest. Records are summarised together with SCHEMA NAME.
DIGEST TEXT	The unhashed form of the digest.
COUNT_STAR	Number of summarized events
SUM_TIMER_WAIT	Total wait time of the summarized events that are timed.
MIN_TIMER_WAIT	Minimum wait time of the summarized events that are timed.
AVG_TIMER_WAIT	Average wait time of the summarized events that are timed.
MAX_TIMER_WAIT	Maximum wait time of the summarized events that are timed.
SUM_LOCK_TIME	Sum of the LOCK_TIME column in the events_statements_current table.
SUM_ERRORS	Sum of the ERRORS column in the events_statements_current table.
SUM_WARNINGS	Sum of the WARNINGS column in the events_statements_current table.
SUM_ROWS_AFFECTED	Sum of the ROWS_AFFECTED column in the events_statements_current table.
SUM_ROWS_SENT	Sum of the ROWS_SENT column in the events_statements_current table.
SUM_ROWS_EXAMINED	Sum of the ROWS_EXAMINED column in the events_statements_current table.
SUM_CREATED_TMP_DISK_TABLES	Sum of the CREATED_TMP_DISK_TABLES column in the events_statements_current table.
SUM_CREATED_TMP_TABLES	Sum of the CREATED_TMP_TABLES column in the events_statements_current table.
SUM_SELECT_FULL_JOIN	Sum of the SELECT_FULL_JOIN column in the events_statements_current table.
SUM_SELECT_FULL_RANGE_JOIN	Sum of the SELECT_FULL_RANGE_JOIN column in the events_statements_current table.
SUM_SELECT_RANGE	Sum of the SELECT_RANGE column in the events_statements_current table.
SUM_SELECT_RANGE_CHECK	Sum of the SELECT_RANGE_CHECK column in the events_statements_current table.
SUM_SELECT_SCAN	Sum of the SELECT_SCAN column in the events_statements_current table.
SUM_SORT_MERGE_PASSES	Sum of the SORT_MERGE_PASSES column in the events_statements_current table.
SUM_SORT_RANGE	Sum of the SORT_RANGE column in the events_statements_current table.
SUM_SORT_ROWS	Sum of the SORT_ROWS column in the events_statements_current table.
SUM_SORT_SCAN	Sum of the SORT_SCAN column in the events_statements_current table.
SUM_NO_INDEX_USED	Sum of the NO_INDEX_USED column in the events_statements_current table.
SUM_NO_GOOD_INDEX_USED	Sum of the NO_GOOD_INDEX_USED column in the events_statements_current table.
FIRST_SEEN	Time at which the digest was first seen.
LAST_SEEN	Time at which the digest was most recently seen.

The `*_TIMER_WAIT` columns only calculate results for timed events, as non-timed events have a `NULL` wait time.

The `events_statements_summary_by_digest` table is limited in size by the performance_schema_digests_size system variable. Once the limit has been reached and the table is full, all entries are aggregated in a row with a `NULL` digest. The `COUNT_STAR` value of this `NULL` row indicates how many digests are recorded in the row and therefore gives an indication of whether `performance_schema_digests_size` should be increased to provide more accurate statistics.

Performance Schema events_statements_summary_by_host_by_event_name Table

The Performance Schema events_statements_summary_by_host_by_event_name table contains statement events summarized by host and event name. It contains the following columns:

Column	Description
HOST	Host. Used together with EVENT_NAME for grouping events.
EVENT_NAME	Event name. Used together with HOST for grouping events.
COUNT_STAR	Number of summarized events
SUM_TIMER_WAIT	Total wait time of the summarized events that are timed.
MIN_TIMER_WAIT	Minimum wait time of the summarized events that are timed.
AVG_TIMER_WAIT	Average wait time of the summarized events that are timed.
MAX_TIMER_WAIT	Maximum wait time of the summarized events that are timed.
SUM_LOCK_TIME	Sum of the LOCK_TIME column in the events_statements_currentd table.
SUM_ERRORS	Sum of the ERRORS column in the events_statements_current table.
SUM_WARNINGS	Sum of the WARNINGS column in the events_statements_current table.
SUM_ROWS_AFFECTED	Sum of the ROWS_AFFECTED column in the events_statements_current table.
SUM_ROWS_SENT	Sum of the ROWS_SENT column in the events_statements_current table.
SUM_ROWS_EXAMINED	Sum of the ROWS_EXAMINED column in the events_statements_current table.
SUM_CREATED_TMP_DISK_TABLES	Sum of the CREATED_TMP_DISK_TABLES column in the events_statements_current table.
SUM_CREATED_TMP_TABLES	Sum of the CREATED_TMP_TABLES column in the events_statements_current table.
SUM_SELECT_FULL_JOIN	Sum of the SELECT_FULL_JOIN column in the events_statements_current table.
SUM_SELECT_FULL_RANGE_JOIN	Sum of the SELECT_FULL_RANGE_JOINW column in the events_statements_current table.
SUM_SELECT_RANGE	Sum of the SELECT_RANGE column in the events_statements_current table.
SUM_SELECT_RANGE_CHECK	Sum of the SELECT_RANGE_CHECK column in the events_statements_current table.
SUM_SELECT_SCAN	Sum of the SELECT_SCAN column in the events_statements_current table.
SUM_SORT_MERGE_PASSES	Sum of the SORT_MERGE_PASSES column in the events_statements_current table.
SUM_SORT_RANGE	Sum of the SORT_RANGE column in the events_statements_current table.
SUM_SORT_ROWS	Sum of the SORT_ROWS column in the events_statements_current table.
SUM_SORT_SCAN	Sum of the SORT_SCAN column in the events_statements_current table.
SUM_NO_INDEX_USED	Sum of the NO_INDEX_USED column in the events_statements_current table.
SUM_NO_GOOD_INDEX_USED	Sum of the NO_GOOD_INDEX_USED column in the events_statements_current table.

The `*_TIMER_WAIT` columns only calculate results for timed events, as non-timed events have a `NULL` wait time.

Example

```
SELECT * FROM events_statements_summary_by_host_by_event_name\G
...
*************************** 347. row ***************************
                      HOST: NULL
                EVENT_NAME: statement/com/Error
                COUNT_STAR: 0
            SUM_TIMER_WAIT: 0
            MIN_TIMER_WAIT: 0
            AVG_TIMER_WAIT: 0
            MAX_TIMER_WAIT: 0
             SUM_LOCK_TIME: 0

Performance Schema events_statements_summary_by_program Table

> **Note:**
>
> The `events_statements_summary_by_program` table, along with many other new Performance Schema tables, was added in MariaDB 10.5.2.

Each row in the Performance Schema events_statements_summary_by_program table summarizes events for a particular stored program (stored procedure, stored function, trigger or event).

It contains the following fields.

Column	Type	Null	Description
OBJECT_TYPE	enum('EVENT', 'FUNCTION', 'PROCEDURE', 'TABLE', 'TRIGGER')	YES	Object type for which the summary is generated.
OBJECT_SCHEMA	varchar(64)	NO	The schema of the object for which the summary is generated.
OBJECT_NAME	varchar(64)	NO	The name of the object for which the summary is generated.
COUNT_STAR	bigint(20) unsigned	NO	The number of summarized events (from events_statements_current). This value includes all events, whether timed or nontimed.
SUM_TIMER_WAIT	bigint(20) unsigned	NO	The number of summarized events (from events_statements_current). This value includes all events, whether timed or nontimed.
MIN_TIMER_WAIT	bigint(20) unsigned	NO	The minimum wait time of the summarized timed events.
AVG_TIMER_WAIT	bigint(20) unsigned	NO	The average wait time of the summarized timed events.
MAX_TIMER_WAIT	bigint(20) unsigned	NO	The maximum wait time of the summarized timed events.
COUNT_STATEMENTS	bigint(20) unsigned	NO	Total number of nested statements invoked during stored program execution.
SUM_STATEMENTS_WAIT	bigint(20) unsigned	NO	The total wait time of the summarized timed statements. This value is calculated only for timed statements because nontimed statements have a wait time of NULL. The same is true for the other xxx_STATEMENT_WAIT values.
MIN_STATEMENTS_WAIT	bigint(20) unsigned	NO	The minimum wait time of the summarized timed statements.
AVG_STATEMENTS_WAIT	bigint(20) unsigned	NO	The average wait time of the summarized timed statements.
MAX_STATEMENTS_WAIT	bigint(20) unsigned	NO	The maximum wait time of the summarized timed statements.
SUM_LOCK_TIME	bigint(20) unsigned	NO	The total time spent (in picoseconds) waiting for table locks for the summarized statements.
SUM_ERRORS	bigint(20) unsigned	NO	The total number of errors that occurend for the summarized statements.
SUM_WARNINGS	bigint(20) unsigned	NO	The total number of warnings that occurend for the summarized statements.
SUM_ROWS_AFFECTED	bigint(20) unsigned	NO	The total number of affected rows by the summarized statements.

Column	Type	Null	Description
SUM_ROWS_SENT	bigint(20) unsigned	NO	The total number of rows returned by the summarized statements.
SUM_ROWS_EXAMINED	bigint(20) unsigned	NO	The total number of rows examined by the summarized statements.The total number of affected rows by the summarized statements.
SUM_CREATED_TMP_DISK_TABLES	bigint(20) unsigned	NO	The total number of on-disk temporary tables created by the summarized statements.
SUM_CREATED_TMP_TABLES	bigint(20) unsigned	NO	The total number of in-memory temporary tables created by the summarized statements.
SUM_SELECT_FULL_JOIN	bigint(20) unsigned	NO	The total number of full joins executed by the summarized statements.
SUM_SELECT_FULL_RANGE_JOIN	bigint(20) unsigned	NO	The total number of range search joins executed by the summarized statements.
SUM_SELECT_RANGE	bigint(20) unsigned	NO	The total number of joins that used ranges on the first table executed by the summarized statements.
SUM_SELECT_RANGE_CHECK	bigint(20) unsigned	NO	The total number of joins that check for key usage after each row executed by the summarized statements.
SUM_SELECT_SCAN	bigint(20) unsigned	NO	The total number of joins that did a full scan of the first table executed by the summarized statements.
SUM_SORT_MERGE_PASSES	bigint(20) unsigned	NO	The total number of merge passes that the sort algorithm has had to do for the summarized statements.
SUM_SORT_RANGE	bigint(20) unsigned	NO	The total number of sorts that were done using ranges for the summarized statements.
SUM_SORT_ROWS	bigint(20) unsigned	NO	The total number of sorted rows that were sorted by the summarized statements.
SUM_SORT_SCAN	bigint(20) unsigned	NO	The total number of sorts that were done by scanning the table by the summarized statements.
SUM_NO_INDEX_USED	bigint(20) unsigned	NO	The total number of statements that performed a table scan without using an index.
SUM_NO_GOOD_INDEX_USED	bigint(20) unsigned	NO	The total number of statements where no good index was found.

Performance Schema events_statements_summary_by_thread_by_event_name Table

The Performance Schema `events_statements_summary_by_thread_by_event_name` table contains statement events summarized by thread and event name. It contains the following columns:

Column	Description
THREAD_ID	Thread associated with the event. Together with EVENT_NAME uniquely identifies the row.
EVENT_NAME	Event name. Used together with THREAD_ID for grouping events.
COUNT_STAR	Number of summarized events
SUM_TIMER_WAIT	Total wait time of the summarized events that are timed.

Column	Description
MIN_TIMER_WAIT	Minimum wait time of the summarized events that are timed.
AVG_TIMER_WAIT	Average wait time of the summarized events that are timed.
MAX_TIMER_WAIT	Maximum wait time of the summarized events that are timed.
SUM_LOCK_TIME	Sum of the LOCK_TIME column in the events_statements_current table.
SUM_ERRORS	Sum of the ERRORS column in the events_statements_current table.
SUM_WARNINGS	Sum of the WARNINGS column in the events_statements_current table.
SUM_ROWS_AFFECTED	Sum of the ROWS_AFFECTED column in the events_statements_current table.
SUM_ROWS_SENT	Sum of the ROWS_SENT column in the events_statements_current table.
SUM_ROWS_EXAMINED	Sum of the ROWS_EXAMINED column in the events_statements_current table.
SUM_CREATED_TMP_DISK_TABLES	Sum of the CREATED_TMP_DISK_TABLES column in the events_statements_current table.
SUM_CREATED_TMP_TABLES	Sum of the CREATED_TMP_TABLES column in the events_statements_current table.
SUM_SELECT_FULL_JOIN	Sum of the SELECT_FULL_JOIN column in the events_statements_current table.
SUM_SELECT_FULL_RANGE_JOIN	Sum of the SELECT_FULL_RANGE_JOIN column in the events_statements_current table.
SUM_SELECT_RANGE	Sum of the SELECT_RANGE column in the events_statements_current table.
SUM_SELECT_RANGE_CHECK	Sum of the SELECT_RANGE_CHECK column in the events_statements_current table.
SUM_SELECT_SCAN	Sum of the SELECT_SCAN column in the events_statements_current table.
SUM_SORT_MERGE_PASSES	Sum of the SORT_MERGE_PASSES column in the events_statements_current table.
SUM_SORT_RANGE	Sum of the SORT_RANGE column in the events_statements_current table.
SUM_SORT_ROWS	Sum of the SORT_ROWS column in the events_statements_current table.
SUM_SORT_SCAN	Sum of the SORT_SCAN column in the events_statements_current table.
SUM_NO_INDEX_USED	Sum of the NO_INDEX_USED column in the events_statements_current table.
SUM_NO_GOOD_INDEX_USED	Sum of the NO_GOOD_INDEX_USED column in the events_statements_current table.

The `*_TIMER_WAIT` columns only calculate results for timed events, as non-timed events have a `NULL` wait time.

Example

```
SELECT * FROM events_statements_summary_by_thread_by_event_name\G
...
*************************** 3653. row ***************************
                  THREAD_ID: 64

Performance Schema events_statements_summary_by_user_by_event_name Table

The Performance Schema `events_statements_summary_by_user_by_event_name` table contains statement events summarized by user and event name. It contains the following columns:

Column	Description
USER	User. Used together with EVENT_NAME for grouping events.
EVENT_NAME	Event name. Used together with USER for grouping events.
COUNT_STAR	Number of summarized events
SUM_TIMER_WAIT	Total wait time of the summarized events that are timed.
MIN_TIMER_WAIT	Minimum wait time of the summarized events that are timed.
AVG_TIMER_WAIT	Average wait time of the summarized events that are timed.
MAX_TIMER_WAIT	Maximum wait time of the summarized events that are timed.
SUM_LOCK_TIME	Sum of the LOCK_TIME column in the events_statements_current table.
SUM_ERRORS	Sum of the ERRORS column in the events_statements_current table.
SUM_WARNINGS	Sum of the WARNINGS column in the events_statements_current table.
SUM_ROWS_AFFECTED	Sum of the ROWS_AFFECTED column in the events_statements_current table.
SUM_ROWS_SENT	Sum of the ROWS_SENT column in the events_statements_current table.
SUM_ROWS_EXAMINED	Sum of the ROWS_EXAMINED column in the events_statements_current table.
SUM_CREATED_TMP_DISK_TABLES	Sum of the CREATED_TMP_DISK_TABLES column in the events_statements_current table.
SUM_CREATED_TMP_TABLES	Sum of the CREATED_TMP_TABLES column in the events_statements_current table.
SUM_SELECT_FULL_JOIN	Sum of the SELECT_FULL_JOIN column in the events_statements_current table.
SUM_SELECT_FULL_RANGE_JOIN	Sum of the SELECT_FULL_RANGE_JOIN column in the events_statements_current table.
SUM_SELECT_RANGE	Sum of the SELECT_RANGE column in the events_statements_current table.
SUM_SELECT_RANGE_CHECK	Sum of the SELECT_RANGE_CHECK column in the events_statements_current table.
SUM_SELECT_SCAN	Sum of the SELECT_SCAN column in the events_statements_current table.
SUM_SORT_MERGE_PASSES	Sum of the SORT_MERGE_PASSES column in the events_statements_current table.
SUM_SORT_RANGE	Sum of the SORT_RANGE column in the events_statements_current table.
SUM_SORT_ROWS	Sum of the SORT_ROWS column in the events_statements_current table.
SUM_SORT_SCAN	Sum of the SORT_SCAN column in the events_statements_current table.
SUM_NO_INDEX_USED	Sum of the NO_INDEX_USED column in the events_statements_current table.
SUM_NO_GOOD_INDEX_USED	Sum of the NO_GOOD_INDEX_USED column in the events_statements_current table.

The `*_TIMER_WAIT` columns only calculate results for timed events, as non-timed events have a `NULL` wait time.

Example

```
SELECT * FROM events_statements_summary_by_user_by_event_name\G
...
*************************** 521. row ***************************
                    USER: NULL

Performance Schema events_statements_summary_global_by_event_name Table

The Performance Schema `events_statements_summary_global_by_event_name` table contains statement events summarized by event name. It contains the following columns:

Column	Description
EVENT_NAME	Event name.
COUNT_STAR	Number of summarized events
SUM_TIMER_WAIT	Total wait time of the summarized events that are timed.
MIN_TIMER_WAIT	Minimum wait time of the summarized events that are timed.
AVG_TIMER_WAIT	Average wait time of the summarized events that are timed.
MAX_TIMER_WAIT	Maximum wait time of the summarized events that are timed.
SUM_LOCK_TIME	Sum of the LOCK_TIME column in the events_statements_current table.
SUM_ERRORS	Sum of the ERRORS column in the events_statements_current table.
SUM_WARNINGS	Sum of the WARNINGS column in the events_statements_current table.
SUM_ROWS_AFFECTED	Sum of the ROWS_AFFECTED column in the events_statements_current table.
SUM_ROWS_SENT	Sum of the ROWS_SENT column in the events_statements_current table.
SUM_ROWS_EXAMINED	Sum of the ROWS_EXAMINED column in the events_statements_current table.
SUM_CREATED_TMP_DISK_TABLES	Sum of the CREATED_TMP_DISK_TABLES column in the events_statements_current table.
SUM_CREATED_TMP_TABLES	Sum of the CREATED_TMP_TABLES column in the events_statements_current table.
SUM_SELECT_FULL_JOIN	Sum of the SELECT_FULL_JOIN column in the events_statements_current table.
SUM_SELECT_FULL_RANGE_JOIN	Sum of the SELECT_FULL_RANGE_JOIN column in the events_statements_current table.
SUM_SELECT_RANGE	Sum of the SELECT_RANGE column in the events_statements_current table.
SUM_SELECT_RANGE_CHECK	Sum of the SELECT_RANGE_CHECK column in the events_statements_current table.
SUM_SELECT_SCAN	Sum of the SELECT_SCAN column in the events_statements_current table.
SUM_SORT_MERGE_PASSES	Sum of the SORT_MERGE_PASSES column in the events_statements_current table.
SUM_SORT_RANGE	Sum of the SORT_RANGE column in the events_statements_current table.
SUM_SORT_ROWS	Sum of the SORT_ROWS column in the events_statements_current table.
SUM_SORT_SCAN	Sum of the SORT_SCAN column in the events_statements_current table.
SUM_NO_INDEX_USED	Sum of the NO_INDEX_USED column in the events_statements_current table.
SUM_NO_GOOD_INDEX_USED	Sum of the NO_GOOD_INDEX_USED column in the events_statements_current table.

The `*_TIMER_WAIT` columns only calculate results for timed events, as non-timed events have a `NULL` wait time.

Example

```
SELECT * FROM events_statements_summary_global_by_event_name\G
...
*************************** 173. row ***************************
                EVENT_NAME: statement/com/Error
                COUNT_STAR: 0

Performance Schema events_transactions_current Table

> **Note:**
>
> The `events_transactions_current` table is available from MariaDB 10.5.2.

The `events_transactions_current` table contains current transaction events for each thread.

The table size cannot be figured, and always stores one row for each thread, showing the current status of the thread's most recent monitored transaction event.

The table contains the following columns:

Column	Type	Description
THREAD_ID	bigint(20) unsigned	The thread associated with the event.
EVENT_ID	bigint(20) unsigned	The event id associated with the event.
END_EVENT_ID	bigint(20) unsigned	This column is set to NULL when the event starts and updated to the thread current event number when the event ends.
EVENT_NAME	varchar(128)	The name of the instrument from which the event was collected. This is a NAME value from the setup_instruments table.
STATE	enum('ACTIVE', 'COMMITTED', 'ROLLED BACK')	The current transaction state. The value is ACTIVE (after START TRANSACTION or BEGIN), COMMITTED (after COMMIT), or ROLLED BACK (after ROLLBACK).
TRX_ID	bigint(20) unsigned	Unused.
GTID	varchar(64)	Transaction GTID, using the format DOMAIN-SERVER_ID-SEQUENCE_NO.
XID_FORMAT_ID	int(11)	XA transaction format ID for GTRID and BQUAL values.
XID_GTRID	varchar(130)	XA global transaction ID.
XID_BQUAL	varchar(130)	XA transaction branch qualifier.
XA_STATE	varchar(64)	The state of the XA transaction. The value is ACTIVE (after XA START), IDLE (after XA END), PREPARED (after XA PREPARE), ROLLED BACK (after XA ROLLBACK), or COMMITTED (after XA COMMIT).
SOURCE	varchar(64)	The name of the source file containing the instrumented code that produced the event and the line number in the file at which the instrumentation occurs.
TIMER_START	bigint(20) unsigned	The unit is picoseconds. When event timing started. NULL if event has no timing information.
TIMER_END	bigint(20) unsigned	The unit is picoseconds. When event timing ended. NULL if event has no timing information.
TIMER_WAIT	bigint(20) unsigned	The unit is picoseconds. Event duration. NULL if event has not timing information.
ACCESS_MODE	enum('READ ONLY', 'READ WRITE')	Transaction access mode.
ISOLATION_LEVEL	varchar(64)	Transaction isolation level. One of: REPEATABLE READ, READ COMMITTED, READ UNCOMMITTED, or SERIALIZABLE.
AUTOCOMMIT	enum('YES','NO')	Whether autcommit mode was enabled when the transaction started.
NUMBER_OF_SAVEPOINTS	bigint(20) unsigned	The number of SAVEPOINT statements issued during the transaction.
NUMBER_OF_ROLLBACK_TO_SAVEPOINT	bigint(20) unsigned	The number of ROLLBACK_TO_SAVEPOINT statements issued during the transaction.
NUMBER_OF_RELEASE_SAVEPOINT	bigint(20) unsigned	The number of RELEASE_SAVEPOINT statements issued during the transaction.
OBJECT_INSTANCE_BEGIN	bigint(20) unsigned	Unused.
NESTING_EVENT_ID	bigint(20) unsigned	The EVENT_ID value of the event within which this event is nested.
NESTING_EVENT_TYPE	enum('TRANSACTION', 'STATEMENT', 'STAGE', 'WAIT')	The nesting event type.

Performance Schema events_transactions_history Table

> **Note:**
>
> The `events_transactions_history` table is available from MariaDB 10.5.2.

The `events_transactions_history` table contains the most recent completed transaction events for each thread.

The number of records stored per thread in the table is determined by the performance_schema_events_transactions_history_size system variable, which is autosized on startup.

If adding a completed transaction event would cause the table to exceed this limit, the oldest thread row is discarded.

All of a thread's rows are discarded when the thread ends.

The table contains the following columns:

Column	Type	Description
THREAD_ID	bigint(20) unsigned	The thread associated with the event.
EVENT_ID	bigint(20) unsigned	The event id associated with the event.
END_EVENT_ID	bigint(20) unsigned	This column is set to NULL when the event starts and updated to the thread current event number when the event ends.
EVENT_NAME	varchar(128)	The name of the instrument from which the event was collected. This is a NAME value from the setup_instruments table.
STATE	enum('ACTIVE', 'COMMITTED',' ROLLED BACK')	The current transaction state. The value is ACTIVE (after START TRANSACTION or BEGIN), COMMITTED (after COMMIT), or ROLLED BACK (after ROLLBACK).
TRX_ID	bigint(20) unsigned	Unused.
GTID	varchar(64)	Transaction GTID, using the format DOMAIN-SERVER_ID-SEQUENCE_NO.
XID_FORMAT_ID	int(11)	XA transaction format ID for GTRID and BQUAL values.
XID_GTRID	varchar(130)	XA global transaction ID.
XID_BQUAL	varchar(130)	XA transaction branch qualifier.
XA_STATE	varchar(64)	The state of the XA transaction. The value is ACTIVE (after XA START), IDLE (after XA END), PREPARED (after XA PREPARE), ROLLED BACK (after XA ROLLBACK), or COMMITTED (after XA COMMIT).
SOURCE	varchar(64)	The name of the source file containing the instrumented code that produced the event and the line number in the file at which the instrumentation occurs.
TIMER_START	bigint(20) unsigned	The unit is picoseconds. When event timing started. NULL if event has no timing information.
TIMER_END	bigint(20) unsigned	The unit is picoseconds. When event timing ended. NULL if event has no timing information.
TIMER_WAIT	bigint(20) unsigned	The unit is picoseconds. Event duration. NULL if event has not timing information.
ACCESS_MODE	enum('READ ONLY', 'READ WRITE')	Transaction access mode.
ISOLATION_LEVEL	varchar(64)	Transaction isolation level. One of: REPEATABLE READ, READ COMMITTED, READ UNCOMMITTED, or SERIALIZABLE.
AUTOCOMMIT	enum('YES', 'NO')	NO

Column	Type	Description
NUMBER_OF_SAVEPOINTS	bigint(20) unsigned	The number of SAVEPOINT statements issued during the transaction.
NUMBER_OF_ROLLBACK_TO_SAVEPOINT	bigint(20) unsigned	The number of ROLLBACK_TO_SAVEPOINT statements issued during the transaction.
NUMBER_OF_RELEASE_SAVEPOINT	bigint(20) unsigned	The number of RELEASE_SAVEPOINT statements issued during the transaction.
OBJECT_INSTANCE_BEGIN	bigint(20) unsigned	Unused.
NESTING_EVENT_ID	bigint(20) unsigned	The EVENT_ID value of the event within which this event is nested.
NESTING_EVENT_TYPE	enum('TRANSACTION','STATEMENT', 'STAGE', 'WAIT')	The nesting event type.

Performance Schema events_transactions_history_long Table

> **Note:**
>
> The `events_transactions_history_long` table is available from MariaDB 10.5.2.

The `events_transactions_history_long` table contains the most recent completed transaction events that have ended globally, across all threads.

The number of records stored in the table is determined by the performance_schema_events_transactions_history_long_size system variable, which is autosized on startup.

If adding a completed transaction would cause the table to exceed this limit, the oldest row, regardless of thread, is discarded.

The table contains the following columns:

Column	Type	Description
THREAD_ID	bigint(20) unsigned	The thread associated with the event.
EVENT_ID	bigint(20) unsigned	The event id associated with the event.
END_EVENT_ID	bigint(20) unsigned	This column is set to NULL when the event starts and updated to the thread current event number when the event ends.
EVENT_NAME	varchar(128)	The name of the instrument from which the event was collected. This is a NAME value from the setup_instruments table.
STATE	enum('ACTIVE', 'COMMITTED',' ROLLED BACK')	The current transaction state. The value is ACTIVE (after START TRANSACTION or BEGIN), COMMITTED (after COMMIT), or ROLLED BACK (after ROLLBACK).
TRX_ID	bigint(20) unsigned	Unused.
GTID	varchar(64)	Transaction GTID, using the format DOMAIN-SERVER_ID-SEQUENCE_NO.
XID_FORMAT_ID	int(11)	XA transaction format ID for GTRID and BQUAL values.
XID_GTRID	varchar(130)	XA global transaction ID.
XID_BQUAL	varchar(130)	XA transaction branch qualifier.

Column	Type	Description
XA_STATE	varchar(64)	The state of the XA transaction. The value is ACTIVE (after XA START), IDLE (after XA END), PREPARED (after XA PREPARE), ROLLED BACK (after XA ROLLBACK), or COMMITTED (after XA COMMIT).
SOURCE	varchar(64)	The name of the source file containing the instrumented code that produced the event and the line number in the file at which the instrumentation occurs.
TIMER_START	bigint(20) unsigned	The unit is picoseconds. When event timing started. NULL if event has no timing information.
TIMER_END	bigint(20) unsigned	The unit is picoseconds. When event timing ended. NULL if event has no timing information.
TIMER_WAIT	bigint(20) unsigned	The unit is picoseconds. Event duration. NULL if event has not timing information.
ACCESS_MODE	enum('READ ONLY', 'READ WRITE')	Transaction access mode.
ISOLATION_LEVEL	varchar(64)	Transaction isolation level. One of: REPEATABLE READ, READ COMMITTED, READ UNCOMMITTED, or SERIALIZABLE.
AUTOCOMMIT	enum('YES', 'NO')	NO
NUMBER_OF_SAVEPOINTS	bigint(20) unsigned	The number of SAVEPOINT statements issued during the transaction.
NUMBER_OF_ROLLBACK_TO_SAVEPOINT	bigint(20) unsigned	The number of ROLLBACK_TO_SAVEPOINT statements issued during the transaction.
NUMBER_OF_RELEASE_SAVEPOINT	bigint(20) unsigned	The number of RELEASE_SAVEPOINT statements issued during the transaction.
OBJECT_INSTANCE_BEGIN	bigint(20) unsigned	Unused.
NESTING_EVENT_ID	bigint(20) unsigned	The EVENT_ID value of the event within which this event is nested.
NESTING_EVENT_TYPE	enum('TRANSACTION','STATEMENT', 'STAGE', 'WAIT')	The nesting event type.

Performance Schema events_transactions_summary_by_account_by_event_name Table

> **Note:**
>
> The `events_transactions_summary_by_account_by_event_name` table is available from MariaDB 10.5.2.

The `events_transactions_summary_by_account_by_event_name` table contains information on transaction events aggregated by account and event name.

The table contains the following columns:

Column	Type	Description
USER	char(32)	User for which summary is generated.
HOST	char(60)	Host for which summary is generated.
EVENT_NAME	varchar(128)	Event name for which summary is generated.
COUNT_STAR	bigint(20) unsigned	The number of summarized events. This value includes all events, whether timed or nontimed.

Column	Type	Description
SUM_TIMER_WAIT	bigint(20) unsigned	The total wait time of the summarized timed events. This value is calculated only for timed events because nontimed events have a wait time of NULL. The same is true for the other xxx_TIMER_WAIT values.
MIN_TIMER_WAIT	bigint(20) unsigned	The minimum wait time of the summarized timed events.
AVG_TIMER_WAIT	bigint(20) unsigned	The average wait time of the summarized timed events.
MAX_TIMER_WAIT	bigint(20) unsigned	The maximum wait time of the summarized timed events.
COUNT_READ_WRITE	bigint(20) unsigned	The total number of only READ/WRITE transaction events.
SUM_TIMER_READ_WRITE	bigint(20) unsigned	The total wait time of only READ/WRITE transaction events.
MIN_TIMER_READ_WRITE	bigint(20) unsigned	The minimum wait time of only READ/WRITE transaction events.
AVG_TIMER_READ_WRITE	bigint(20) unsigned	The average wait time of only READ/WRITE transaction events.
MAX_TIMER_READ_WRITE	bigint(20) unsigned	The maximum wait time of only READ/WRITE transaction events.
COUNT_READ_ONLY	bigint(20) unsigned	The total number of only READ ONLY transaction events.
SUM_TIMER_READ_ONLY	bigint(20) unsigned	The total wait time of only READ ONLY transaction events.
MIN_TIMER_READ_ONLY	bigint(20) unsigned	The minimum wait time of only READ ONLY transaction events.
AVG_TIMER_READ_ONLY	bigint(20) unsigned	The average wait time of only READ ONLY transaction events.
MAX_TIMER_READ_ONLY	bigint(20) unsigned	The maximum wait time of only READ ONLY transaction events.

Performance Schema events_transactions_summary_by_host_by_event_name Table

> **Note:**
>
> The `events_transactions_summary_by_host_by_event_name` table is available from MariaDB 10.5.2.

The `events_transactions_summary_by_host_by_event_name` table contains information on transaction events aggregated by host and event name.

The table contains the following columns:

Column	Type	Description
HOST	char(60)	Host for which summary is generated.
EVENT_NAME	varchar(128)	Event name for which summary is generated.
COUNT_STAR	bigint(20) unsigned	The number of summarized events. This value includes all events, whether timed or nontimed.
SUM_TIMER_WAIT	bigint(20) unsigned	The total wait time of the summarized timed events. This value is calculated only for timed events because nontimed events have a wait time of NULL. The same is true for the other xxx_TIMER_WAIT values.

Column	Type	Description
MIN_TIMER_WAIT	bigint(20) unsigned	The minimum wait time of the summarized timed events.
AVG_TIMER_WAIT	bigint(20) unsigned	The average wait time of the summarized timed events.
MAX_TIMER_WAIT	bigint(20) unsigned	The maximum wait time of the summarized timed events.
COUNT_READ_WRITE	bigint(20) unsigned	The total number of only READ/WRITE transaction events.
SUM_TIMER_READ_WRITE	bigint(20) unsigned	The total wait time of only READ/WRITE transaction events.
MIN_TIMER_READ_WRITE	bigint(20) unsigned	The minimum wait time of only READ/WRITE transaction events.
AVG_TIMER_READ_WRITE	bigint(20) unsigned	The average wait time of only READ/WRITE transaction events.
MAX_TIMER_READ_WRITE	bigint(20) unsigned	The maximum wait time of only READ/WRITE transaction events.
COUNT_READ_ONLY	bigint(20) unsigned	The total number of only READ ONLY transaction events.
SUM_TIMER_READ_ONLY	bigint(20) unsigned	The total wait time of only READ ONLY transaction events.
MIN_TIMER_READ_ONLY	bigint(20) unsigned	The minimum wait time of only READ ONLY transaction events.
AVG_TIMER_READ_ONLY	bigint(20) unsigned	The average wait time of only READ ONLY transaction events.
MAX_TIMER_READ_ONLY	bigint(20) unsigned	The maximum wait time of only READ ONLY transaction events.

Performance Schema events_transactions_summary_by_thread_by_event_name Table

> **Note:**
>
> The events_transactions_summary_by_thread_by_event_name table is available from MariaDB 10.5.2.

The `events_transactions_summary_by_thread_by_event_name` table contains information on transaction events aggregated by thread and event name.

The table contains the following columns:

```
+----------------------+---------------------+------+-----+---------+-------+
| Field                | Type                | Null | Key | Default | Extra |
+----------------------+---------------------+------+-----+---------+-------+
| THREAD_ID            | bigint(20) unsigned | NO   |     | NULL    |       |
| EVENT_NAME           | varchar(128)        | NO   |     | NULL    |       |
| COUNT_STAR           | bigint(20) unsigned | NO   |     | NULL    |       |
| SUM_TIMER_WAIT       | bigint(20) unsigned | NO   |     | NULL    |       |
| MIN_TIMER_WAIT       | bigint(20) unsigned | NO   |     | NULL    |       |
| AVG_TIMER_WAIT       | bigint(20) unsigned | NO   |     | NULL    |       |
| MAX_TIMER_WAIT       | bigint(20) unsigned | NO   |     | NULL    |       |
| COUNT_READ_WRITE     | bigint(20) unsigned | NO   |     | NULL    |       |
| SUM_TIMER_READ_WRITE | bigint(20) unsigned | NO   |     | NULL    |       |
| MIN_TIMER_READ_WRITE | bigint(20) unsigned | NO   |     | NULL    |       |
| AVG_TIMER_READ_WRITE | bigint(20) unsigned | NO   |     | NULL    |       |
| MAX_TIMER_READ_WRITE | bigint(20) unsigned | NO   |     | NULL    |       |
| COUNT_READ_ONLY      | bigint(20) unsigned | NO   |     | NULL    |       |
| SUM_TIMER_READ_ONLY  | bigint(20) unsigned | NO   |     | NULL    |       |
| MIN_TIMER_READ_ONLY  | bigint(20) unsigned | NO   |     | NULL    |       |
| AVG_TIMER_READ_ONLY  | bigint(20) unsigned | NO   |     | NULL    |       |

Performance Schema events_waits_current Table

The `events_waits_current` table contains the status of a thread's most recently monitored wait event, listing one event per thread.

The table contains the following columns:

Column	Description
THREAD_ID	Thread associated with the event. Together with EVENT_ID uniquely identifies the row.
EVENT_ID	Thread's current event number at the start of the event. Together with THREAD_ID uniquely identifies the row.
END_EVENT_ID	NULL when the event starts, set to the thread's current event number at the end of the event.
EVENT_NAME	Event instrument name and a NAME from the setup_instruments table
SOURCE	Name and line number of the source file containing the instrumented code that produced the event.
TIMER_START	Value in picoseconds when the event timing started or NULL if timing is not collected.
TIMER_END	Value in picoseconds when the event timing ended, or NULL if the event has not ended or timing is not collected.
TIMER_WAIT	Value in picoseconds of the event's duration or NULL if the event has not ended or timing is not collected.
SPINS	Number of spin rounds for a mutex, or NULL if spin rounds are not used, or spinning is not instrumented.
OBJECT_SCHEMA	Name of the schema that contains the table for table I/O objects, otherwise NULL for file I/O and synchronization objects.
OBJECT_NAME	File name for file I/O objects, table name for table I/O objects, the socket's IP:PORT value for a socket object or NULL for a synchronization object.
INDEX NAME	Name of the index, PRIMARY for the primary key, or NULL for no index used.

Column	Description
OBJECT_TYPE	FILE for a file object, TABLE or TEMPORARY TABLE for a table object, or NULL for a synchronization object.
OBJECT_INSTANCE_BEGIN	Address in memory of the object.
NESTING_EVENT_ID	EVENT_ID of event within which this event nests.
NESTING_EVENT_TYPE	Nesting event type. Either statement, stage or wait.
OPERATION	Operation type, for example read, write or lock
NUMBER_OF_BYTES	Number of bytes that the operation read or wrote, or NULL for table I/O waits.
FLAGS	Reserved for use in the future.

It is possible to empty this table with a `TRUNCATE TABLE` statement.

The related tables, events_waits_history and events_waits_history_long derive their values from the current events.

This page is licensed: CC BY-SA / Gnu FDL

Performance Schema events_waits_history Table

The `events_waits_history` table by default contains the ten most recent completed wait events per thread. This number can be adjusted by setting the performance_schema_events_waits_history_size system variable when the server starts up.

The table structure is identical to the events_waits_current table structure, and contains the following columns:

Column	Description
THREAD_ID	Thread associated with the event. Together with EVENT_ID uniquely identifies the row.
EVENT_ID	Thread's current event number at the start of the event. Together with THREAD_ID uniquely identifies the row.
END_EVENT_ID	NULL when the event starts, set to the thread's current event number at the end of the event.
EVENT_NAME	Event instrument name and a NAME from the setup_instruments table
SOURCE	Name and line number of the source file containing the instrumented code that produced the event.
TIMER_START	Value in picoseconds when the event timing started or NULL if timing is not collected.
TIMER_END	Value in picoseconds when the event timing ended, or NULL if timing is not collected.
TIMER_WAIT	Value in picoseconds of the event's duration or NULL if timing is not collected.
SPINS	Number of spin rounds for a mutex, or NULL if spin rounds are not used, or spinning is not instrumented.
OBJECT_SCHEMA	Name of the schema that contains the table for table I/O objects, otherwise NULL for file I/O and synchronization objects.
OBJECT_NAME	File name for file I/O objects, table name for table I/O objects, the socket's IP:PORT value for a socket object or NULL for a synchronization object.
INDEX NAME	Name of the index, PRIMARY for the primary key, or NULL for no index used.
OBJECT_TYPE	FILE for a file object, TABLE or TEMPORARY TABLE for a table object, or NULL for a synchronization object.
OBJECT_INSTANCE_BEGIN	Address in memory of the object.
NESTING_EVENT_ID	EVENT_ID of event within which this event nests.
NESTING_EVENT_TYPE	Nesting event type. Either statement, stage or wait.
OPERATION	Operation type, for example read, write or lock
NUMBER_OF_BYTES	Number of bytes that the operation read or wrote, or NULL for table I/O waits.

Column	Description
FLAGS	Reserved for use in the future.

It is possible to empty this table with a `TRUNCATE TABLE` statement.

events_waits_current and events_waits_history_long are related tables.

Performance Schema events_waits_history_long Table

The `events_waits_history_long` table by default contains the ten thousand most recent completed wait events. This number can be adjusted by setting the performance_schema_events_waits_history_long_size system variable when the server starts up.

The table structure is identical to the events_waits_current table structure, and contains the following columns:

Column	Description
THREAD_ID	Thread associated with the event. Together with EVENT_ID uniquely identifies the row.
EVENT_ID	Thread's current event number at the start of the event. Together withTHREAD_IDuniquely identifies the row.
END_EVENT_ID	NULL when the event starts, set to the thread's current event number at the end of the event.
EVENT_NAME	Event instrument name and a NAME from the setup_instruments table
SOURCE	Name and line number of the source file containing the instrumented code that produced the event.
TIMER_START	Value in picoseconds when the event timing started or NULL if timing is not collected.
TIMER_END	Value in picoseconds when the event timing ended, or NULL if timing is not collected.
TIMER_WAIT	Value in picoseconds of the event's duration or NULL if timing is not collected.
SPINS	Number of spin rounds for a mutex, or NULL if spin rounds are not used, or spinning is not instrumented.
OBJECT_SCHEMA	Name of the schema that contains the table for table I/O objects, otherwise NULL for file I/O and synchronization objects.
OBJECT_NAME	File name for file I/O objects, table name for table I/O objects, the socket's IP:PORT value for a socket object or NULL for a synchronization object.
INDEX_NAME	Name of the index, PRIMARY for the primary key, or NULL for no index used.
OBJECT_TYPE	FILE for a file object, TABLE or TEMPORARY TABLE for a table object, or NULL for a synchronization object.
OBJECT_INSTANCE_BEGIN	Address in memory of the object.
NESTING_EVENT_ID	EVENT_ID of event within which this event nests.
NESTING_EVENT_TYPE	Nesting event type. Either statement, stage or wait.
OPERATION	Operation type, for example read, write or lock
NUMBER_OF_BYTES	Number of bytes that the operation read or wrote, or NULL for table I/O waits.
FLAGS	Reserved for use in the future.

It is possible to empty this table with a `TRUNCATE TABLE` statement.

events_waits_current and events_waits_history are related tables.

Performance Schema events_waits_summary_by_account_by_event_name Table

The Performance Schema `events_waits_summary_by_account_by_event_name` table contains wait events summarized by account and event name. It contains the following columns:

Column	Description
USER	User. Used together with HOST and EVENT_NAME for grouping events.
HOST	Host. Used together with USER and EVENT_NAME for grouping events.
EVENT_NAME	Event name. Used together with USER and HOST for grouping events.
COUNT_STAR	Number of summarized events
SUM_TIMER_WAIT	Total wait time of the summarized events that are timed.
MIN_TIMER_WAIT	Minimum wait time of the summarized events that are timed.
AVG_TIMER_WAIT	Average wait time of the summarized events that are timed.
MAX_TIMER_WAIT	Maximum wait time of the summarized events that are timed.

The `*_TIMER_WAIT` columns only calculate results for timed events, as non-timed events have a `NULL` wait time.

Example

```
SELECT * FROM events_waits_summary_by_account_by_event_name\G
...
*************************** 915. row ***************************
          USER: NULL
          HOST: NULL
    EVENT_NAME: wait/io/socket/sql/server_tcpip_socket
    COUNT_STAR: 0
SUM_TIMER_WAIT: 0
MIN_TIMER_WAIT: 0
AVG_TIMER_WAIT: 0
MAX_TIMER_WAIT: 0
*************************** 916. row ***************************
          USER: NULL
          HOST: NULL
    EVENT_NAME: wait/io/socket/sql/server_unix_socket
    COUNT_STAR: 0
SUM_TIMER_WAIT: 0
MIN_TIMER_WAIT: 0
AVG_TIMER_WAIT: 0
MAX_TIMER_WAIT: 0
*************************** 917. row ***************************
          USER: NULL
          HOST: NULL
    EVENT_NAME: wait/io/socket/sql/client_connection
    COUNT_STAR: 0

Performance Schema events_waits_summary_by_host_by_event_name Table

The Performance Schema `events_waits_summary_by_host_by_event_name` table contains wait events summarized by host and event name. It contains the following columns:

Column	Description
HOST	Host. Used together with EVENT_NAME for grouping events.
EVENT_NAME	Event name. Used together with USER and HOST for grouping events.
COUNT_STAR	Number of summarized events
SUM_TIMER_WAIT	Total wait time of the summarized events that are timed.
MIN_TIMER_WAIT	Minimum wait time of the summarized events that are timed.
AVG_TIMER_WAIT	Average wait time of the summarized events that are timed.
MAX_TIMER_WAIT	Maximum wait time of the summarized events that are timed.

The `*_TIMER_WAIT` columns only calculate results for timed events, as non-timed events have a `NULL` wait time.

Example

```
SELECT * FROM events_waits_summary_by_host_by_event_name\G
...
*************************** 610. row ***************************
          HOST: NULL
    EVENT_NAME: wait/io/socket/sql/server_unix_socket
    COUNT_STAR: 0
SUM_TIMER_WAIT: 0
MIN_TIMER_WAIT: 0
AVG_TIMER_WAIT: 0
MAX_TIMER_WAIT: 0
*************************** 611. row ***************************
          HOST: NULL
    EVENT_NAME: wait/io/socket/sql/client_connection
    COUNT_STAR: 0
SUM_TIMER_WAIT: 0
MIN_TIMER_WAIT: 0
AVG_TIMER_WAIT: 0
MAX_TIMER_WAIT: 0
*************************** 612. row ***************************
          HOST: NULL
    EVENT_NAME: idle
    COUNT_STAR: 0
SUM_TIMER_WAIT: 0
MIN_TIMER_WAIT: 0
AVG_TIMER_WAIT: 0
MAX_TIMER_WAIT: 0
```

Performance Schema events_waits_summary_by_instance Table

The Performance Schema `events_waits_summary_by_instance` table contains wait events summarized by instance. It contains the following columns:

Column	Description
EVENT_NAME	Event name. Used together with OBJECT_INSTANCE_BEGIN for grouping events.
OBJECT_INSTANCE_BEGIN	If an instrument creates multiple instances, each instance has a unique OBJECT_INSTANCE_BEGIN value to allow for grouping by instance.
COUNT_STAR	Number of summarized events
SUM_TIMER_WAIT	Total wait time of the summarized events that are timed.

Column	Description
MIN_TIMER_WAIT	Minimum wait time of the summarized events that are timed.
AVG_TIMER_WAIT	Average wait time of the summarized events that are timed.
MAX_TIMER_WAIT	Maximum wait time of the summarized events that are timed.

The `*_TIMER_WAIT` columns only calculate results for timed events, as non-timed events have a `NULL` wait time.

Example

```
SELECT * FROM events_waits_summary_by_instance\G
...
*************************** 202. row ***************************
           EVENT_NAME: wait/io/file/sql/binlog
OBJECT_INSTANCE_BEGIN: 140578961969856
           COUNT_STAR: 6
       SUM_TIMER_WAIT: 90478331960
       MIN_TIMER_WAIT: 263344
       AVG_TIMER_WAIT: 15079721848
       MAX_TIMER_WAIT: 67760576376
*************************** 203. row ***************************
           EVENT_NAME: wait/io/file/sql/dbopt
OBJECT_INSTANCE_BEGIN: 140578961970560
           COUNT_STAR: 6
       SUM_TIMER_WAIT: 39891428472
       MIN_TIMER_WAIT: 387168
       AVG_TIMER_WAIT: 6648571412
       MAX_TIMER_WAIT: 24503293304
*************************** 204. row ***************************
           EVENT_NAME: wait/io/file/sql/dbopt
OBJECT_INSTANCE_BEGIN: 140578961971264
           COUNT_STAR: 6
       SUM_TIMER_WAIT: 39902495024
       MIN_TIMER_WAIT: 177888
       AVG_TIMER_WAIT: 6650415692
       MAX_TIMER_WAIT: 21026400404
```

Performance Schema events_waits_summary_by_thread_by_event_name Table

The Performance Schema `events_waits_summary_by_thread_by_event_name` table contains wait events summarized by thread and event name. It contains the following columns:

Column	Description
THREAD_ID	Thread associated with the event. Together with EVENT_NAME uniquely identifies the row.
EVENT_NAME	Event name. Used together with THREAD_ID for grouping events.
COUNT_STAR	Number of summarized events
SUM_TIMER_WAIT	Total wait time of the summarized events that are timed.
MIN_TIMER_WAIT	Minimum wait time of the summarized events that are timed.
AVG_TIMER_WAIT	Average wait time of the summarized events that are timed.
MAX_TIMER_WAIT	Maximum wait time of the summarized events that are timed.

The `*_TIMER_WAIT` columns only calculate results for timed events, as non-timed events have a `NULL` wait time.

Example

```
SELECT * FROM events_waits_summary_by_thread_by_event_name\G
...
*************************** 6424. row ***************************
     THREAD_ID: 64
    EVENT_NAME: wait/io/socket/sql/server_unix_socket
    COUNT_STAR: 0
SUM_TIMER_WAIT: 0
MIN_TIMER_WAIT: 0
AVG_TIMER_WAIT: 0
MAX_TIMER_WAIT: 0
*************************** 6425. row ***************************
     THREAD_ID: 64
    EVENT_NAME: wait/io/socket/sql/client_connection
    COUNT_STAR: 0
SUM_TIMER_WAIT: 0
MIN_TIMER_WAIT: 0
AVG_TIMER_WAIT: 0
MAX_TIMER_WAIT: 0
*************************** 6426. row ***************************
     THREAD_ID: 64
    EVENT_NAME: idle
    COUNT_STAR: 73
SUM_TIMER_WAIT: 22005252162000000
MIN_TIMER_WAIT: 3000000
AVG_TIMER_WAIT: 301441810000000
MAX_TIMER_WAIT: 4912417573000000
```

Performance Schema events_waits_summary_by_user_by_event_name Table

The Performance Schema `events_waits_summary_by_user_by_event_name` table contains wait events summarized by user and event name. It contains the following columns:

Column	Description
USER	User. Used together with EVENT_NAME for grouping events.
EVENT_NAME	Event name. Used together with USER for grouping events.
COUNT_STAR	Number of summarized events
SUM_TIMER_WAIT	Total wait time of the summarized events that are timed.
MIN_TIMER_WAIT	Minimum wait time of the summarized events that are timed.
AVG_TIMER_WAIT	Average wait time of the summarized events that are timed.
MAX_TIMER_WAIT	Maximum wait time of the summarized events that are timed.

The `*_TIMER_WAIT` columns only calculate results for timed events, as non-timed events have a `NULL` wait time.

Example

```
SELECT * FROM events_waits_summary_by_user_by_event_name\G
...
*************************** 916. row ***************************
          USER: NULL
    EVENT_NAME: wait/io/socket/sql/server_unix_socket
    COUNT_STAR: 0
SUM_TIMER_WAIT: 0
MIN_TIMER_WAIT: 0
AVG_TIMER_WAIT: 0
MAX_TIMER_WAIT: 0
*************************** 917. row ***************************
          USER: NULL
    EVENT_NAME: wait/io/socket/sql/client_connection
    COUNT_STAR: 0
SUM_TIMER_WAIT: 0
MIN_TIMER_WAIT: 0
AVG_TIMER_WAIT: 0
MAX_TIMER_WAIT: 0
*************************** 918. row ***************************
          USER: NULL
    EVENT_NAME: idle
    COUNT_STAR: 0
SUM_TIMER_WAIT: 0
MIN_TIMER_WAIT: 0
AVG_TIMER_WAIT: 0
MAX_TIMER_WAIT: 0
```

Performance Schema events_waits_summary_global_by_event_name Table

The Performance Schema `events_waits_summary_global_by_event_name` table contains wait events summarized by event name. It contains the following columns:

Column	Description
EVENT_NAME	Event name.
COUNT_STAR	Number of summarized events
SUM_TIMER_WAIT	Total wait time of the summarized events that are timed.
MIN_TIMER_WAIT	Minimum wait time of the summarized events that are timed.
AVG_TIMER_WAIT	Average wait time of the summarized events that are timed.
MAX_TIMER_WAIT	Maximum wait time of the summarized events that are timed.

The `*_TIMER_WAIT` columns only calculate results for timed events, as non-timed events have a `NULL` wait time.

Example

```
SELECT * FROM events_waits_summary_global_by_event_name\G
...
*************************** 303. row ***************************
    EVENT_NAME: wait/io/socket/sql/server_tcpip_socket
    COUNT_STAR: 0
SUM_TIMER_WAIT: 0
MIN_TIMER_WAIT: 0
AVG_TIMER_WAIT: 0
MAX_TIMER_WAIT: 0
*************************** 304. row ***************************
    EVENT_NAME: wait/io/socket/sql/server_unix_socket
    COUNT_STAR: 0
SUM_TIMER_WAIT: 0
MIN_TIMER_WAIT: 0
AVG_TIMER_WAIT: 0
MAX_TIMER_WAIT: 0
*************************** 305. row ***************************
    EVENT_NAME: wait/io/socket/sql/client_connection
    COUNT_STAR: 0
SUM_TIMER_WAIT: 0
MIN_TIMER_WAIT: 0
AVG_TIMER_WAIT: 0
MAX_TIMER_WAIT: 0
*************************** 306. row ***************************
    EVENT_NAME: idle
    COUNT_STAR: 265
SUM_TIMER_WAIT: 46861125181000000
MIN_TIMER_WAIT: 1000000
AVG_TIMER_WAIT: 176834434000000
MAX_TIMER_WAIT: 4912417573000000
```

Performance Schema file_instances Table

Description

The `file_instances` table lists instances of instruments seen by the Performance Schema when executing file I/O instrumentation, and the associated files. Only files that have been opened, and that have not been deleted, will be listed in the table.

The performance_schema_max_file_instances system variable specifies the maximum number of instrumented file objects.

Column	Description
FILE_NAME	File name.
EVENT_NAME	Instrument name associated with the file.
OPEN_COUNT	Open handles on the file. A value of greater than zero means that the file is currently open.

Example

```
SELECT * FROM performance_schema.file_instances WHERE OPEN_COUNT>0;
+---------------------------------------------------+-------------------------------------+------------
+
| FILE_NAME                                         | EVENT_NAME                          | OPEN_COUNT
|
+---------------------------------------------------+-------------------------------------+------------
+
| /var/log/mysql/mariadb-bin.index                  | wait/io/file/sql/binlog_index       |          1
|
| /var/lib/mysql/ibdata1                            | wait/io/file/innodb/innodb_data_file |          2
|
| /var/lib/mysql/ib_logfile0                        | wait/io/file/innodb/innodb_log_file  |          2
|
| /var/lib/mysql/ib_logfile1                        | wait/io/file/innodb/innodb_log_file  |          2
|
| /var/lib/mysql/mysql/gtid_slave_pos.ibd           | wait/io/file/innodb/innodb_data_file |          3
|
| /var/lib/mysql/mysql/innodb_index_stats.ibd       | wait/io/file/innodb/innodb_data_file |          3
|
| /var/lib/mysql/mysql/innodb_table_stats.ibd       | wait/io/file/innodb/innodb_data_file |          3
|
...
```

Performance Schema file_summary_by_event_name Table

The Performance Schema `file_summary_by_event_name` table contains file events summarized by event name. It contains the following columns:

Column	Description
EVENT_NAME	Event name.
COUNT_STAR	Number of summarized events
SUM_TIMER_WAIT	Total wait time of the summarized events that are timed.
MIN_TIMER_WAIT	Minimum wait time of the summarized events that are timed.
AVG_TIMER_WAIT	Average wait time of the summarized events that are timed.
MAX_TIMER_WAIT	Maximum wait time of the summarized events that are timed.
COUNT_READ	Number of all read operations, including FGETS, FGETC, FREAD, and READ.
SUM_TIMER_READ	Total wait time of all read operations that are timed.
MIN_TIMER_READ	Minimum wait time of all read operations that are timed.
AVG_TIMER_READ	Average wait time of all read operations that are timed.
MAX_TIMER_READ	Maximum wait time of all read operations that are timed.
SUM_NUMBER_OF_BYTES_READ	Bytes read by read operations.
COUNT_WRITE	Number of all write operations, including FPUTS, FPUTC, FPRINTF, VFPRINTF, FWRITE, and PWRITE.
SUM_TIMER_WRITE	Total wait time of all write operations that are timed.
MIN_TIMER_WRITE	Minimum wait time of all write operations that are timed.
AVG_TIMER_WRITE	Average wait time of all write operations that are timed.
MAX_TIMER_WRITE	Maximum wait time of all write operations that are timed.

Column	Description
SUM_NUMBER_OF_BYTES_WRITE	Bytes written by write operations.
COUNT_MISC	Number of all miscellaneous operations not counted above, including CREATE, DELETE, OPEN, CLOSE, STREAM_OPEN, STREAM_CLOSE, SEEK, TELL, FLUSH, STAT, FSTAT, CHSIZE, RENAME, and SYNC.
SUM_TIMER_MISC	Total wait time of all miscellaneous operations that are timed.
MIN_TIMER_MISC	Minimum wait time of all miscellaneous operations that are timed.
AVG_TIMER_MISC	Average wait time of all miscellaneous operations that are timed.
MAX_TIMER_MISC	Maximum wait time of all miscellaneous operations that are timed.

I/O operations can be avoided by caching, in which case they will not be recorded in this table.

You can TRUNCATE the table, which will reset all counters to zero.

Example

```
SELECT * FROM file_summary_by_event_name\G
...
*************************** 49. row ***************************
               EVENT_NAME: wait/io/file/aria/MAD
               COUNT_STAR: 60
           SUM_TIMER_WAIT: 397234368
           MIN_TIMER_WAIT: 0
           AVG_TIMER_WAIT: 6620224
           MAX_TIMER_WAIT: 16808672
               COUNT_READ: 0
           SUM_TIMER_READ: 0
           MIN_TIMER_READ: 0
           AVG_TIMER_READ: 0
           MAX_TIMER_READ: 0
 SUM_NUMBER_OF_BYTES_READ: 0
              COUNT_WRITE: 0
          SUM_TIMER_WRITE: 0
          MIN_TIMER_WRITE: 0
          AVG_TIMER_WRITE: 0
          MAX_TIMER_WRITE: 0
SUM_NUMBER_OF_BYTES_WRITE: 0
               COUNT_MISC: 60
           SUM_TIMER_MISC: 397234368
           MIN_TIMER_MISC: 0
           AVG_TIMER_MISC: 6620224
           MAX_TIMER_MISC: 16808672
*************************** 50. row ***************************
               EVENT_NAME: wait/io/file/aria/control
               COUNT_STAR: 3
           SUM_TIMER_WAIT: 24055778544
           MIN_TIMER_WAIT: 0
           AVG_TIMER_WAIT: 8018592848
           MAX_TIMER_WAIT: 24027262400
               COUNT_READ: 1
           SUM_TIMER_READ: 24027262400
           MIN_TIMER_READ: 0
           AVG_TIMER_READ: 24027262400
           MAX_TIMER_READ: 24027262400
 SUM_NUMBER_OF_BYTES_READ: 52
              COUNT_WRITE: 0
          SUM_TIMER_WRITE: 0
          MIN_TIMER_WRITE: 0
          AVG_TIMER_WRITE: 0
          MAX_TIMER_WRITE: 0
SUM_NUMBER_OF_BYTES_WRITE: 0
               COUNT_MISC: 2
           SUM_TIMER_MISC: 28516144
           MIN_TIMER_MISC: 0
           AVG_TIMER_MISC: 14258072
           MAX_TIMER_MISC: 27262208
```

Performance Schema file_summary_by_instance Table

The Performance Schema `file_summary_by_instance` table contains file events summarized by instance. It contains the following columns:

Column	Description
FILE_NAME	File name.
EVENT_NAME	Event name.
OBJECT_INSTANCE_BEGIN	Address in memory. Together with FILE_NAME and EVENT_NAME uniquely identifies a row.

Column	Description
COUNT_STAR	Number of summarized events
SUM_TIMER_WAIT	Total wait time of the summarized events that are timed.
MIN_TIMER_WAIT	Minimum wait time of the summarized events that are timed.
AVG_TIMER_WAIT	Average wait time of the summarized events that are timed.
MAX_TIMER_WAIT	Maximum wait time of the summarized events that are timed.
COUNT_READ	Number of all read operations, including FGETS, FGETC, FREAD, and READ.
SUM_TIMER_READ	Total wait time of all read operations that are timed.
MIN_TIMER_READ	Minimum wait time of all read operations that are timed.
AVG_TIMER_READ	Average wait time of all read operations that are timed.
MAX_TIMER_READ	Maximum wait time of all read operations that are timed.
SUM_NUMBER_OF_BYTES_READ	Bytes read by read operations.
COUNT_WRITE	Number of all write operations, including FPUTS, FPUTC, FPRINTF, VFPRINTF, FWRITE, and PWRITE.
SUM_TIMER_WRITE	Total wait time of all write operations that are timed.
MIN_TIMER_WRITE	Minimum wait time of all write operations that are timed.
AVG_TIMER_WRITE	Average wait time of all write operations that are timed.
MAX_TIMER_WRITE	Maximum wait time of all write operations that are timed.
SUM_NUMBER_OF_BYTES_WRITE	Bytes written by write operations.
COUNT_MISC	Number of all miscellaneous operations not counted above, including CREATE, DELETE, OPEN, CLOSE, STREAM_OPEN, STREAM_CLOSE, SEEK, TELL, FLUSH, STAT, FSTAT, CHSIZE, RENAME, and SYNC.
SUM_TIMER_MISC	Total wait time of all miscellaneous operations that are timed.
MIN_TIMER_MISC	Minimum wait time of all miscellaneous operations that are timed.
AVG_TIMER_MISC	Average wait time of all miscellaneous operations that are timed.
MAX_TIMER_MISC	Maximum wait time of all miscellaneous operations that are timed.

I/O operations can be avoided by caching, in which case they will not be recorded in this table.

You can TRUNCATE the table, which will reset all counters to zero.

Example

```
SELECT * FROM file_summary_by_instance\G
...
*************************** 204. row ***************************
                FILE_NAME: /var/lib/mysql/test/db.opt
               EVENT_NAME: wait/io/file/sql/dbopt
    OBJECT_INSTANCE_BEGIN: 140578961971264
               COUNT_STAR: 6
           SUM_TIMER_WAIT: 39902495024

Performance Schema global_status Table

Note:

The `global_status` table is available from MariaDB 10.5.2.

The `global_status` table contains a list of status variables and their global values. The table only stores status variable statistics for threads which are instrumented, and does not collect statistics for `Com_xxx` variables.

The table contains the following columns:

Column	Description
VARIABLE_NAME	The global status variable name.
VARIABLE_VALUE	The global status variable value.

TRUNCATE TABLE resets global status variables, including thread, account, host, and user status, but not those that are never reset by the server.

This page is licensed: CC BY-SA / Gnu FDL

Performance Schema host_cache Table

The `host_cache` table contains host and IP information from the host_cache, used for avoiding DNS lookups for new client connections.

The host_cache table contains the following columns:

Column	Description
IP	Client IP address.
HOST	IP's resolved DNS host name, or NULL if unknown.
HOST_VALIDATED	YES if the IP-to-host DNS lookup was successful, and the HOST column can be used to avoid DNS calls, or NO if unsuccessful, in which case DNS lookup is performed for each connect until either successful or a permanent error.
SUM_CONNECT_ERRORS	Number of connection errors. Counts only protocol handshake errors for hosts that passed validation. These errors count towards max_connect_errors.
COUNT_HOST_BLOCKED_ERRORS	Number of blocked connections because SUM_CONNECT_ERRORS exceeded the max_connect_errors system variable.
COUNT_NAMEINFO_TRANSIENT_ERRORS	Number of transient errors during IP-to-host DNS lookups.
COUNT_NAMEINFO_PERMANENT_ERRORS	Number of permanent errors during IP-to-host DNS lookups.
COUNT_FORMAT_ERRORS	Number of host name format errors, for example a numeric host column.
COUNT_ADDRINFO_TRANSIENT_ERRORS	Number of transient errors during host-to-IP reverse DNS lookups.
COUNT_ADDRINFO_PERMANENT_ERRORS	Number of permanent errors during host-to-IP reverse DNS lookups.
COUNT_FCRDNS_ERRORS	Number of forward-confirmed reverse DNS errors, which occur when IP-to-host DNS lookup does not match the originating IP address.
COUNT_HOST_ACL_ERRORS	Number of errors occurring because no user from the host is permitted to log in. These attempts return error code 1130 ER_HOST_NOT_PRIVILEGED and do not proceed to username and password authentication.
COUNT_NO_AUTH_PLUGIN_ERRORS	Number of errors due to requesting an authentication plugin that was not available. This can be due to the plugin never having been loaded, or the load attempt failing.
COUNT_AUTH_PLUGIN_ERRORS	Number of errors reported by an authentication plugin. Plugins can increment COUNT_AUTHENTICATION_ERRORS or COUNT_HANDSHAKE_ERRORS instead, but, if specified or the error is unknown, this column is incremented.
COUNT_HANDSHAKE_ERRORS	Number of errors detected at the wire protocol level.

Column	Description
COUNT_PROXY_USER_ERRORS	Number of errors detected when a proxy user is proxied to a user that does not exist.
COUNT_PROXY_USER_ACL_ERRORS	Number of errors detected when a proxy user is proxied to a user that exists, but the proxy user doesn't have the PROXY privilege.
COUNT_AUTHENTICATION_ERRORS	Number of errors where authentication failed.
COUNT_SSL_ERRORS	Number of errors due to TLS problems.
COUNT_MAX_USER_CONNECTIONS_ERRORS	Number of errors due to the per-user quota being exceeded.
COUNT_MAX_USER_CONNECTIONS_PER_HOUR_ERRORS	Number of errors due to the per-hour quota being exceeded.
COUNT_DEFAULT_DATABASE_ERRORS	Number of errors due to the user not having permission to access the specified default database, or it not existing.
COUNT_INIT_CONNECT_ERRORS	Number of errors due to statements in the init_connect system variable.
COUNT_LOCAL_ERRORS	Number of local server errors, such as out-of-memory errors, unrelated to network, authentication, or authorization.
COUNT_UNKNOWN_ERRORS	Number of unknown errors that cannot be allocated to another column.
FIRST_SEEN	Timestamp of the first connection attempt by the IP.
LAST_SEEN	Timestamp of the most recent connection attempt by the IP.
FIRST_ERROR_SEEN	Timestamp of the first error seen from the IP.
LAST_ERROR_SEEN	Timestamp of the most recent error seen from the IP.

The `host_cache` table, along with the `host_cache`, is cleared with FLUSH HOSTS, TRUNCATE TABLE `host_cache` or by setting the host_cache_size system variable at runtime.

This page is licensed: CC BY-SA / Gnu FDL

Performance Schema hosts Table

Description

The `hosts` table contains a row for each host used by clients to connect to the server, containing current and total connections.

The size is determined by the performance_schema_hosts_size system variable, which, if set to zero, will disable connection statistics in the hosts table.

It contains the following columns:

Column	Description
HOST	Host name used by the client to connect, NULL for internal threads or user sessions that failed to authenticate.
CURRENT_CONNECTIONS	Current number of the host's connections.
TOTAL_CONNECTIONS	Total number of the host's connections

Example

```
SELECT * FROM hosts;
+-----------+--------------------+------------------+
| HOST      | CURRENT_CONNECTIONS | TOTAL_CONNECTIONS |
+-----------+--------------------+------------------+
| localhost |                  1 |               45 |
| NULL      |                 20 |               23 |
+-----------+--------------------+------------------+
```

Performance Schema memory_summary_by_account_by_event_name Table

Note:

The `memory_summary_by_account_by_event_name` table is available from MariaDB 10.5.2.

There are five memory summary tables in the Performance Schema that share a number of fields in common. These include:

- memory_summary_by_account_by_event_name
- memory_summary_by_host_by_event_name
- memory_summary_by_thread_by_event_name
- memory_summary_by_user_by_event_name
- memory_global_by_event_name

The `memory_summary_by_account_by_event_name` table contains memory usage statistics aggregated by account and event.

The table contains the following columns:

Field	Type	Null	Default	Description
USER	char(32)	YES	NULL	User portion of the account.
HOST	char(60)	YES	NULL	Host portion of the account.
EVENT_NAME	varchar(128)	NO	NULL	Event name.
COUNT_ALLOC	bigint(20) unsigned	NO	NULL	Total number of allocations to memory.
COUNT_FREE	bigint(20) unsigned	NO	NULL	Total number of attempts to free the allocated memory.
SUM_NUMBER_OF_BYTES_ALLOC	bigint(20) unsigned	NO	NULL	Total number of bytes allocated.
SUM_NUMBER_OF_BYTES_FREE	bigint(20) unsigned	NO	NULL	Total number of bytes freed
LOW_COUNT_USED	bigint(20)	NO	NULL	Lowest number of allocated blocks (lowest value of CURRENT_COUNT_USED).
CURRENT_COUNT_USED	bigint(20)	NO	NULL	Currently allocated blocks that have not been freed (COUNT_ALLOC minus COUNT_FREE).
HIGH_COUNT_USED	bigint(20)	NO	NULL	Highest number of allocated blocks (highest value of CURRENT_COUNT_USED).

Field	Type	Null	Default	Description
LOW_NUMBER_OF_BYTES_USED	bigint(20)	NO	NULL	Lowest number of bytes used.
CURRENT_NUMBER_OF_BYTES_USED	bigint(20)	NO	NULL	Current number of bytes used (total allocated minus total freed).
HIGH_NUMBER_OF_BYTES_USED	bigint(20)	NO	NULL	Highest number of bytes used.

Performance Schema memory_summary_by_host_by_event_name Table

> **Note:**
>
> The `memory_summary_by_host_by_event_name` table is available from MariaDB 10.5.2.

There are five memory summary tables in the Performance Schema that share a number of fields in common. These include:

- memory_summary_by_account_by_event_name
- memory_summary_by_host_by_event_name
- memory_summary_by_thread_by_event_name
- memory_summary_by_user_by_event_name
- memory_global_by_event_name

The `memory_summary_by_host_by_event_name` table contains memory usage statistics aggregated by host and event.

The table contains the following columns:

Field	Type	Null	Default	Description
HOST	char(60)	YES	NULL	Host portion of the account.
EVENT_NAME	varchar(128)	NO	NULL	Event name.
COUNT_ALLOC	bigint(20) unsigned	NO	NULL	Total number of allocations to memory.
COUNT_FREE	bigint(20) unsigned	NO	NULL	Total number of attempts to free the allocated memory.
SUM_NUMBER_OF_BYTES_ALLOC	bigint(20) unsigned	NO	NULL	Total number of bytes allocated.
SUM_NUMBER_OF_BYTES_FREE	bigint(20) unsigned	NO	NULL	Total number of bytes freed
LOW_COUNT_USED	bigint(20)	NO	NULL	Lowest number of allocated blocks (lowest value of CURRENT_COUNT_USED).
CURRENT_COUNT_USED	bigint(20)	NO	NULL	Currently allocated blocks that have not been freed (COUNT_ALLOC minus COUNT_FREE).
HIGH_COUNT_USED	bigint(20)	NO	NULL	Highest number of allocated blocks (highest value of CURRENT_COUNT_USED).
LOW_NUMBER_OF_BYTES_USED	bigint(20)	NO	NULL	Lowest number of bytes used.

Field	Type	Null	Default	Description
CURRENT_NUMBER_OF_BYTES_USED	bigint(20)	NO	NULL	Current number of bytes used (total allocated minus total freed).
HIGH_NUMBER_OF_BYTES_USED	bigint(20)	NO	NULL	Highest number of bytes used.

Performance Schema memory_summary_by_thread_by_event_name Table

> **Note:**
>
> The `memory_summary_by_thread_by_event_name` table is available from MariaDB 10.5.2.

There are five memory summary tables in the Performance Schema that share a number of fields in common. These include:

- memory_summary_by_account_by_event_name
- memory_summary_by_host_by_event_name
- memory_summary_by_thread_by_event_name
- memory_summary_by_user_by_event_name
- memory_global_by_event_name

The `memory_summary_by_thread_by_event_name` table contains memory usage statistics aggregated by thread and event.

The table contains the following columns:

Field	Type	Null	Default	Description
THREAD_ID	bigint(20) unsigned	NO	NULL	Thread id.
EVENT_NAME	varchar(128)	NO	NULL	Event name.
COUNT_ALLOC	bigint(20) unsigned	NO	NULL	Total number of allocations to memory.
COUNT_FREE	bigint(20) unsigned	NO	NULL	Total number of attempts to free the allocated memory.
SUM_NUMBER_OF_BYTES_ALLOC	bigint(20) unsigned	NO	NULL	Total number of bytes allocated.
SUM_NUMBER_OF_BYTES_FREE	bigint(20) unsigned	NO	NULL	Total number of bytes freed
LOW_COUNT_USED	bigint(20)	NO	NULL	Lowest number of allocated blocks (lowest value of CURRENT_COUNT_USED).
CURRENT_COUNT_USED	bigint(20)	NO	NULL	Currently allocated blocks that have not been freed (COUNT_ALLOC minus COUNT_FREE).
HIGH_COUNT_USED	bigint(20)	NO	NULL	Highest number of allocated blocks (highest value of CURRENT_COUNT_USED).
LOW_NUMBER_OF_BYTES_USED	bigint(20)	NO	NULL	Lowest number of bytes used.
CURRENT_NUMBER_OF_BYTES_USED	bigint(20)	NO	NULL	Current number of bytes used (total allocated minus total freed).

Field	Type	Null	Default	Description
HIGH_NUMBER_OF_BYTES_USED	bigint(20)	NO	NULL	Highest number of bytes used.

Performance Schema memory_summary_by_user_by_event_name Table

> **Note:**
>
> The `memory_summary_by_user_by_event_name` table is available from MariaDB 10.5.2.

There are five memory summary tables in the Performance Schema that share a number of fields in common. These include:

- memory_summary_by_account_by_event_name
- memory_summary_by_host_by_event_name
- memory_summary_by_thread_by_event_name
- memory_summary_by_user_by_event_name
- memory_global_by_event_name

The `memory_summary_by_user_by_event_name` table contains memory usage statistics aggregated by user and event.

The table contains the following columns:

Field	Type	Null	Default	Description
USER	char(32)	YES	NULL	User portion of the account.
EVENT_NAME	varchar(128)	NO	NULL	Event name.
COUNT_ALLOC	bigint(20) unsigned	NO	NULL	Total number of allocations to memory.
COUNT_FREE	bigint(20) unsigned	NO	NULL	Total number of attempts to free the allocated memory.
SUM_NUMBER_OF_BYTES_ALLOC	bigint(20) unsigned	NO	NULL	Total number of bytes allocated.
SUM_NUMBER_OF_BYTES_FREE	bigint(20) unsigned	NO	NULL	Total number of bytes freed
LOW_COUNT_USED	bigint(20)	NO	NULL	Lowest number of allocated blocks (lowest value of CURRENT_COUNT_USED).
CURRENT_COUNT_USED	bigint(20)	NO	NULL	Currently allocated blocks that have not been freed (COUNT_ALLOC minus COUNT_FREE).
HIGH_COUNT_USED	bigint(20)	NO	NULL	Highest number of allocated blocks (highest value of CURRENT_COUNT_USED).
LOW_NUMBER_OF_BYTES_USED	bigint(20)	NO	NULL	Lowest number of bytes used.
CURRENT_NUMBER_OF_BYTES_USED	bigint(20)	NO	NULL	Current number of bytes used (total allocated minus total freed).
HIGH_NUMBER_OF_BYTES_USED	bigint(20)	NO	NULL	Highest number of bytes used.

Performance Schema memory_summary_global_by_event_name Table

> **Note:**
>
> The `memory_summary_global_by_event_name` table is available from MariaDB 10.5.2.

There are five memory summary tables in the Performance Schema that share a number of fields in common. These include:

- memory_summary_by_account_by_event_name
- memory_summary_by_host_by_event_name
- memory_summary_by_thread_by_event_name
- memory_summary_by_user_by_event_name
- memory_summary_global_by_event_name

The `memory_summary_global_by_event_name` table contains memory usage statistics aggregated by event and event.

The table contains the following columns:

Field	Type	Null	Default	Description
EVENT_NAME	varchar(128)	NO	NULL	Event name.
COUNT_ALLOC	bigint(20) unsigned	NO	NULL	Total number of allocations to memory.
COUNT_FREE	bigint(20) unsigned	NO	NULL	Total number of attempts to free the allocated memory.
SUM_NUMBER_OF_BYTES_ALLOC	bigint(20) unsigned	NO	NULL	Total number of bytes allocated.
SUM_NUMBER_OF_BYTES_FREE	bigint(20) unsigned	NO	NULL	Total number of bytes freed
LOW_COUNT_USED	bigint(20)	NO	NULL	Lowest number of allocated blocks (lowest value of CURRENT_COUNT_USED).
CURRENT_COUNT_USED	bigint(20)	NO	NULL	Currently allocated blocks that have not been freed (COUNT_ALLOC minus COUNT_FREE).
HIGH_COUNT_USED	bigint(20)	NO	NULL	Highest number of allocated blocks (highest value of CURRENT_COUNT_USED).
LOW_NUMBER_OF_BYTES_USED	bigint(20)	NO	NULL	Lowest number of bytes used.
CURRENT_NUMBER_OF_BYTES_USED	bigint(20)	NO	NULL	Current number of bytes used (total allocated minus total freed).
HIGH_NUMBER_OF_BYTES_USED	bigint(20)	NO	NULL	Highest number of bytes used.

Example

Seeing what memory was most often allocated for:

```
SELECT * FROM memory_summary_global_by_event_name
  ORDER BY count_alloc DESC LIMIT 1\G
*************************** 1. row ***************************
                 EVENT_NAME: memory/sql/QUICK_RANGE_SELECT::alloc
                COUNT_ALLOC: 147976
                 COUNT_FREE: 147976
   SUM_NUMBER_OF_BYTES_ALLOC: 600190656
    SUM_NUMBER_OF_BYTES_FREE: 600190656
              LOW_COUNT_USED: 0
          CURRENT_COUNT_USED: 0
             HIGH_COUNT_USED: 68
    LOW_NUMBER_OF_BYTES_USED: 0
CURRENT_NUMBER_OF_BYTES_USED: 0
   HIGH_NUMBER_OF_BYTES_USED: 275808
```

Performance Schema metadata_locks Table

> **Note:**
>
> The `metadata_locks` table is available from MariaDB 10.5.2.

Description

The `metadata_locks` table contains metadata lock information.

To enable metadata lock instrumentation at runtime, issue this statement:

```
UPDATE performance_schema.setup_instruments SET enabled='YES', timed='YES'
  WHERE name LIKE 'wait/lock/metadata%';
```

To enable it permanently, add this to the `[mariadb]` section of the configuration file (for instance, `my.cnf`):

```
performance-schema-instrument='wait/lock/metadata/sql/mdl=ON'
```

> **Note:**
>
> Performance Schema must be enabled in the configuration file for this to work (add `performance_schema=ON`).

The table is by default autosized, but the size can be configured with the performance_schema_max_metadata_locks system variable.

The table is read-only, and TRUNCATE TABLE cannot be used to empty the table.

The table contains the following columns:

- `OBJECT_TYPE`
  - `VARCHAR(64)`
  - Null: No
  - Default: `NULL`
  - Description: Object type. One of `BACKUP`, `COMMIT`, `EVENT`, `FUNCTION`, `GLOBAL`, `LOCKING SERVICE`, `PROCEDURE`, `SCHEMA`, `TABLE`, `TABLESPACE`, `TRIGGER` (unused) or `USER LEVEL LOCK`.
- `OBJECT_SCHEMA`
  - `VARCHAR(64)`
  - Null: Yes
  - Default: `NULL`

    - Description: Object schema.
- `OBJECT_NAME`
    - `VARCHAR(64)`
    - Null: Yes
    - Default: `NULL`
    - Description: Object name.
- `OBJECT_INSTANCE_BEGIN`
    - `BIGINT(20) UNSIGNED`
    - Null: No
    - Default: `NULL`
    - Description: Address in memory of the instrumented object.
- `LOCK_TYPE`
    - `VARCHAR(32)`
    - Null: No
    - Default: `NULL`
    - Description: Lock type. One of `BACKUP_ALTER_COPY`, `BACKUP_BLOCK_DDL`, `BACKUP_COMMIT`, `BACKUP_DDL`, `BACKUP_DML`, `BACKUP_FLUSH`, `BACKUP_FTWRL1`, `BACKUP_START`, `BACKUP_TRANS_DML`, `BACKUP_WAIT_COMMIT`, `BACKUP_WAIT_DDL`, `BACKUP_WAIT_FLUSH`. See the Backup Lock Types section for detailed descriptions.
- `LOCK_DURATION`
    - `VARCHAR(32)`
    - Null: No
    - Default: `NULL`
    - Description: Lock duration. One of `EXPLICIT` (locks released by explicit action, for example a global lock acquired with `FLUSH TABLES WITH READ LOCK`), `STATEMENT` (locks implicitly released at statement end), or `TRANSACTION` (locks implicitly released at transaction end).
- `LOCK_STATUS`
    - `VARCHAR(32)`
    - Null: No
    - Default: `NULL`
    - Description: Lock status. One of `GRANTED`, `KILLED`, `PENDING`, `POST_RELEASE_NOTIFY`, `PRE_ACQUIRE_NOTIFY`, `TIMEOUT`, or `VICTIM`.
- `SOURCE`
    - `VARCHAR(64)`
    - Null: Yes
    - Default: `NULL`
    - Description: Source file containing the instrumented code that produced the event, as well as the line number where the instrumentation occurred. This allows one to examine the source code involved.
- `OWNER_THREAD_ID`
    - `BIGINT(20) UNSIGNED`
    - Null: Yes
    - Default: `NULL`
    - Description: Thread that requested the lock.
- `OWNER_EVENT_ID`
    - `BIGINT(20) UNSIGNED`

- Null: Yes
- Default: `NULL`
- Description: Event that requested the lock.

Example

```
MariaDB [performance_schema]> SELECT * FROM metadata_locks\G
*************************** 1. row ***************************
          OBJECT_TYPE: TABLE
        OBJECT_SCHEMA: performance_schema
          OBJECT_NAME: metadata_locks
OBJECT_INSTANCE_BEGIN: 105553150198240
            LOCK_TYPE: SHARED_READ
        LOCK_DURATION: TRANSACTION
          LOCK_STATUS: GRANTED
               SOURCE:
      OWNER_THREAD_ID: 13
       OWNER_EVENT_ID: 1
1 row in set (0.001 sec)
```

Backup Lock Types

`BACKUP_*` lock types exposed through this table allow for granular locking, as opposed to the `FLUSH TABLES WITH READ LOCK` (FTWRL) statement which essentially freezes the entire database. With granular locking, backup tools like mariadb-backup can take consistent backups while keeping the database functioning.

BACKUP_ALTER_COPY

This lock is acquired by the backup engine when it needs to perform an `ALTER TABLE ... COPY` operation.

BACKUP_BLOCK_DDL

This lock is acquired by other operations that need to block DDL statements from being executed during a backup.

BACKUP_COMMIT

This lock is acquired by the backup engine when it needs to commit a transaction.

BACKUP_DDL

This lock is acquired by the backup engine when it needs to process DDL statements.

BACKUP_DML

This lock is acquired by the backup engine when it needs to read data from tables.

BACKUP_FLUSH

This lock is acquired when the backup engine flushes data to disk.

BACKUP_FTWRL1

This is a more refined, less aggressive version of the `FLUSH TABLES WITH READ LOCK` statement. The “1” in the name signifies it is a specific stage of the backup lock hierarchy.

- This lock acts as a short-lived synchronization point. It ensures all non-transactional tables (like MyISAM) are flushed to disk and that the binary log position is captured accurately.
- Since InnoDB handles its own consistency, this lock is primarily for “everything else” in your database – ensuring that the metadata and non-InnoDB tables are in a fixed state for a split second.

BACKUP_START

As the name suggests, this is the initialization lock. When a backup starts, the system needs to set a baseline.

- This lock **prevents DDL[45] operations**. This means you cannot `CREATE`, `ALTER`, `RENAME`, or `DROP` tables while this lock is held.
- This lock protects the table structure during file-copy operations.

BACKUP_TRANS_DML

This lock is the lightest of the three (`BACKUP_START`, `BACKUP_FTWRL1`). It is designed to ensure that DML[46] operations – like `INSERT`, `UPDATE`, and `DELETE` – don't interfere with the backup of transactional tables (for instance, InnoDB).

- This lock **prevents DML changes** to transactional tables during a specific phase of the backup.
- It ensures that the backup tool can reach a consistent state without the data constantly shifting under its feet, but it doesn't block simple `SELECT` queries.

BACKUP_WAIT_COMMIT

This lock is acquired by other operations that need to wait for the backup engine to finish processing commit statements.

BACKUP_WAIT_DDL

This lock is acquired by other operations that need to wait for the backup engine to finish processing DDL statements.

BACKUP_WAIT_FLUSH

This lock is acquired by other operations that need to wait for the backup engine to finish flushing data.

Performance Schema mutex_instances Table

Description

The `mutex_instances` table lists all mutexes that the Performance Schema seeing while the server is executing.

A mutex is a code mechanism for ensuring that threads can only access resources one at a time. A second thread attempting to access a resource will find it protected by a mutex, and will wait for it to be unlocked.

The performance_schema_max_mutex_instances system variable specifies the maximum number of instrumented mutex instances.

Column	Description
NAME	Instrument name associated with the mutex.
OBJECT_INSTANCE_BEGIN	Memory address of the instrumented mutex.
LOCKED_BY_THREAD_ID	The THREAD_ID of the locking thread if a thread has a mutex locked, otherwise NULL.

This page is licensed: CC BY-SA / Gnu FDL

Performance Schema objects_summary_global_by_type Table

It aggregates object wait events, and contains the following columns:

Column	Description
OBJECT_TYPE	Groups records together with OBJECT_SCHEMA and OBJECT_NAME.
OBJECT_SCHEMA	Groups records together with OBJECT_TYPE and OBJECT_NAME.
OBJECT_NAME	Groups records together with OBJECT_SCHEMA and OBJECT_TYPE.
COUNT_STAR	Number of summarized events
SUM_TIMER_WAIT	Total wait time of the summarized events that are timed.
MIN_TIMER_WAIT	Minimum wait time of the summarized events that are timed.
AVG_TIMER_WAIT	Average wait time of the summarized events that are timed.
MAX_TIMER_WAIT	Maximum wait time of the summarized events that are timed.

You can TRUNCATE the table, which will reset all counters to zero.

Example

```
SELECT * FROM objects_summary_global_by_type\G
...
*************************** 101. row ***************************
   OBJECT_TYPE: TABLE
 OBJECT_SCHEMA: test
   OBJECT_NAME: v
    COUNT_STAR: 0
SUM_TIMER_WAIT: 0
MIN_TIMER_WAIT: 0
AVG_TIMER_WAIT: 0
MAX_TIMER_WAIT: 0
*************************** 102. row ***************************
   OBJECT_TYPE: TABLE
 OBJECT_SCHEMA: test
   OBJECT_NAME: xx2
    COUNT_STAR: 2
SUM_TIMER_WAIT: 1621920
MIN_TIMER_WAIT: 481344
AVG_TIMER_WAIT: 810960
MAX_TIMER_WAIT: 1140576
```

This page is licensed: CC BY-SA / Gnu FDL

Performance Schema performance_timers Table

Description

The `performance_timers` table lists available event timers.

It contains the following columns:

Column	Description
TIMER_NAME	Time name, used in the setup_timers table.
TIMER_FREQUENCY	Number of timer units per second. Dependent on the processor speed.
TIMER_RESOLUTION	Number of timer units by which timed values increase each time.
TIMER_OVERHEAD	Minimum timer overhead, determined during initialization by calling the timer 20 times and selecting the smallest value. Total overhead will be at least double this, as the timer is called at the beginning and end of each timed event.

Any `NULL` values indicate that particular timer is not available on your platform, Any timer names with a non-NULL value can be used in the setup_timers table.

Example

```
SELECT * FROM performance_timers;
+-------------+-----------------+------------------+---------------------+
| TIMER_NAME  | TIMER_FREQUENCY | TIMER_RESOLUTION | TIMER_OVERHEAD      |
+-------------+-----------------+------------------+---------------------+
| CYCLE       |      2293651741 |                1 |                  28 |
| NANOSECOND  |      1000000000 |                1 |                  48 |
| MICROSECOND |         1000000 |                1 |                  52 |
| MILLISECOND |            1000 |             1000 | 9223372036854775807 |
| TICK        |             106 |                1 |                 496 |
+-------------+-----------------+------------------+---------------------+
```

Performance Schema prepared_statements_instances Table

> **Note:**
>
> The `prepared_statements_instances` table is available from MariaDB 10.5.2.

The `prepared_statements_instances` table contains aggregated statistics of prepared statements.

The maximum number of rows in the table is determined by the performance_schema_max_prepared_statement_instances system variable, which is by default autosized on startup.

The table contains the following columns:

```
+-----------------------------+-------------------------------------------------------------+------+-----+----
-----+-------+
| Field                       | Type                                                        | Null | Key |
Default | Extra |
+-----------------------------+-------------------------------------------------------------+------+-----+----
-----+-------+
| OBJECT_INSTANCE_BEGIN       | bigint(20) unsigned                                         | NO   |     |
NULL    |       |
| STATEMENT_ID                | bigint(20) unsigned                                         | NO   |     |
NULL    |       |
| STATEMENT_NAME              | varchar(64)                                                 | YES  |     |
NULL    |       |
| SQL_TEXT                    | longtext                                                    | NO   |     |
NULL    |       |
| OWNER_THREAD_ID             | bigint(20) unsigned                                         | NO   |     |
NULL    |       |
| OWNER_EVENT_ID              | bigint(20) unsigned                                         | NO   |     |
NULL    |       |
| OWNER_OBJECT_TYPE           | enum('EVENT','FUNCTION','PROCEDURE','TABLE','TRIGGER') | YES  |     |
NULL    |       |
| OWNER_OBJECT_SCHEMA         | varchar(64)                                                 | YES  |     |

Performance Schema replication_applier_configuration Table

> **Note:**
>
> The `replication_applier_configuration` table is available from MariaDB 10.5.2.

The Performance Schema replication_applier_configuration table contains configuration settings affecting replica transactions.

It contains the following fields.

Field	Type	Null	Description
CHANNEL_NAME	char(64)	NO	Replication channel name.
DESIRED_DELAY	int(11)	NO	Target number of seconds the replica should be delayed to the master.

This page is licensed: CC BY-SA / Gnu FDL

Performance Schema replication_applier_status Table

> **Note:**
>
> The `replication_applier_status` table is available from MariaDB 10.5.2.

The Performance Schema replication_applier_status table contains information about the general transaction execution status on the replica.

It contains the following fields.

Field	Type	Null	Description
CHANNEL_NAME	char(64)	NO	The replication channel name.
SERVICE_STATE	enum('ON','OFF')	NO	Shows ON when the replication channel's applier threads are active or idle, OFF means that the applier threads are not active.
REMAINING_DELAY	int(10) unsigned	YES	Seconds the replica needs to wait to reach the desired delay from master.
COUNT_TRANSACTIONS_RETRIES	bigint(20) unsigned	NO	The number of retries that were made because the replication SQL thread failed to apply a transaction.

This page is licensed: CC BY-SA / Gnu FDL

Performance Schema replication_applier_status_by_coordinator Table

> **Note:**
>
> The `replication_applier_status_by_coordinator` table is available from MariaDB 10.5.2.

The Performance Schema replication_applier_status_by_coordinator table displays the status of the coordinator thread used in multi-threaded replicas to manage multiple worker threads.

It contains the following fields.

Column	Type	Null	Description
CHANNEL_NAME	varchar(256)	NO	Replication channel name.
THREAD_ID	bigint(20) unsigned	YES	The SQL/coordinator thread ID.
SERVICE_STATE	enum('ON','OFF')	NO	ON (thread exists and is active or idle) or OFF (thread no longer exists).
LAST_ERROR_NUMBER	int(11)	NO	Last error number that caused the SQL/coordinator thread to stop.
LAST_ERROR_MESSAGE	varchar(1024)	NO	Last error message that caused the SQL/coordinator thread to stop.
LAST_ERROR_TIMESTAMP	timestamp	NO	Timestamp that shows when the most recent SQL/coordinator error occurred.
LAST_SEEN_TRANSACTION	char(57)	NO	The transaction the worker has last seen.
LAST_TRANS_RETRY_COUNT	int(11)	NO	Total number of retries attempted by last transaction.

This page is licensed: CC BY-SA / Gnu FDL

Performance Schema replication_applier_status_by_worker Table

> **Note:**
>
> The `replication_applier_status_by_worker` table is available from MariaDB 10.6.0.

The Performance Schema replication_applier_status_by_worker table displays replica worker thread specific information.

It contains the following fields.

Column	Description
CHANNEL_NAME	Name of replication channel through which the transaction is received.
THREAD_ID	Thread_Id as displayed in the performance_schema.threads table for thread with name 'thread/sql/rpl_parallel_thread'. THREAD_ID will be NULL when worker threads are stopped due to error/force stop.
SERVICE_STATE	Whether or not the thread is running.
LAST_SEEN_TRANSACTION	Last GTID executed by worker
LAST_ERROR_NUMBER	Last Error that occurred on a particular worker.
LAST_ERROR_MESSAGE	Last error specific message.
LAST_ERROR_TIMESTAMP	Time stamp of last error.
WORKER_IDLE_TIME	Total idle time in seconds that the worker thread has spent waiting for work from SQL thread.

Column	Description
LAST_TRANS_RETRY_COUNT	Total number of retries attempted by last transaction.

This page is licensed: CC BY-SA / Gnu FDL

Performance Schema replication_connection_configuration Table

> **Note:**
>
> The `replication_connection_configuration` table is available from MariaDB 10.6.0.

The Performance Schema replication_connection_configuration table displays replica's configuration settings used for connecting to the primary.

It contains the following fields.

Column	Type	Null	Description
CHANNEL_NAME	varchar(256)	NO	The replication channel used.
HOST	char(60)	NO	The host name of the source that the replica is connected to.
PORT	int(11)	NO	The port used to connect to the source.
USER	char(32)	NO	The user name of the replication user account used to connect to the source.
USING_GTID	enum('NO', 'CURRENT_POS', 'SLAVE_POS')	NO	Whether replication is using GTIDs or not.
SSL_ALLOWED	enum('YES', 'NO', 'IGNORED')	NO	Whether SSL is allowed for the replica connection.
SSL_CA_FILE	varchar(512)	NO	Path to the file that contains one or more certificates for trusted Certificate Authorities (CA) to use for TLS.
SSL_CA_PATH	varchar(512)	NO	Path to a directory that contains one or more PEM files that contain X509 certificates for a trusted Certificate Authority (CA) to use for TLS.
SSL_CERTIFICATE	varchar(512)	NO	Path to the certificate used to authenticate the master.
SSL_CIPHER	varchar(512)	NO	Which cipher is used for encryption.
SSL_KEY	varchar(512)	NO	Path to the private key used for TLS.
SSL_VERIFY_SERVER_CERTIFICATE	enum('YES','NO')	NO	Whether the server certificate is verified as part of the SSL connection.
SSL_CRL_FILE	varchar(255)	NO	Path to the PEM file containing one or more revoked X.509 certificates.
SSL_CRL_PATH	varchar(255)	NO	PATH to a folder containing PEM files containing one or more revoked X.509 certificates.
CONNECTION_RETRY_INTERVAL	int(11)	NO	The number of seconds between connect retries.
CONNECTION_RETRY_COUNT	bigint(20) unsigned	NO	The number of times the replica can attempt to reconnect to the source in the event of a lost connection.

Column	Type	Null	Description
HEARTBEAT_INTERVAL	double(10,3) unsigned	NO	Number of seconds after which a heartbeat will be sent.
IGNORE_SERVER_IDS	longtext	NO	Binary log events from servers (ids) to ignore.
REPL_DO_DOMAIN_IDS	longtext	NO	Only apply binary logs from these domain ids.
REPL_IGNORE_DOMAIN_IDS	longtext	NO	Binary log events from domains to ignore.

Performance Schema rwlock_instances Table

The `rwlock_instances` table lists all read write lock (rwlock) instances that the Performance Schema sees while the server is executing. A read write is a mechanism for ensuring threads can either share access to common resources, or have exclusive access.

The performance_schema_max_rwlock_instances system variable specifies the maximum number of instrumented rwlock objects.

The `rwlock_instances` table contains the following columns:

Column	Description
NAME	Instrument name associated with the read write lock
OBJECT_INSTANCE_BEGIN	Address in memory of the instrumented lock
WRITE_LOCKED_BY_THREAD_ID	THREAD_ID of the locking thread if locked in write (exclusive) mode, otherwise NULL.
READ_LOCKED_BY_COUNT	Count of current read locks held

This page is licensed: CC BY-SA / Gnu FDL

Performance Schema session_account_connect_attrs Table

Description

The `session_account_connect_attrs` table shows connection attributes for the current session.

Applications can pass key/value connection attributes to the server when a connection is made. The session_connect_attrs and `session_account_connect_attrs` tables provide access to this information, for all sessions and the current session respectively.

The C API functions mysql_options() and mysql_optionsv() are used for passing connection attributes to the server.

`session_account_connect_attrs` contains the following columns:

Column	Description
PROCESSLIST_ID	Session connection identifier.
ATTR_NAME	Attribute name.
ATTR_VALUE	Attribute value.
ORDINAL_POSITION	Order in which attribute was added to the connection attributes.

Example

```
SELECT * FROM performance_schema.session_account_connect_attrs;
+----------------+-----------------+------------------+------------------+
| PROCESSLIST_ID | ATTR_NAME       | ATTR_VALUE       | ORDINAL_POSITION |
+----------------+-----------------+------------------+------------------+
|             45 | _os             | debian-linux-gnu |                0 |
|             45 | _client_name    | libmysql         |                1 |
|             45 | _pid            | 7711             |                2 |
|             45 | _client_version | 10.0.5           |                3 |
|             45 | _platform       | x86_64           |                4 |
|             45 | program_name    | mysql            |                5 |
+----------------+-----------------+------------------+------------------+
```

This page is licensed: CC BY-SA / Gnu FDL

Performance Schema session_connect_attrs Table

Description

`session_connect_attrs` is a Performance Schema table that shows connection attributes for all sessions. The Performance Schema needs to be enabled for the table to be populated.

Applications can pass key/value connection attributes to the server when a connection is made. The `session_connect_attrs` and session_account_connect_attrs tables provide access to this information, for all sessions and the current session respectively.

The C API functions mysql_options() and mysql_optionsv() are used for passing connection attributes to the server.

`session_connect_attrs` contains the following columns:

Column	Description
PROCESSLIST_ID	Session connection identifier.
ATTR_NAME	Attribute name.
ATTR_VALUE	Attribute value.
ORDINAL_POSITION	Order in which attribute was added to the connection attributes.

Example

Returning the current connection's attributes:

```
SELECT * FROM performance_schema.session_connect_attrs WHERE processlist_id=CONNECTION_ID();
+----------------+-----------------+------------------+------------------+
| PROCESSLIST_ID | ATTR_NAME       | ATTR_VALUE       | ORDINAL_POSITION |
+----------------+-----------------+------------------+------------------+
|             45 | _os             | debian-linux-gnu |                0 |
|             45 | _client_name    | libmysql         |                1 |
|             45 | _pid            | 7711             |                2 |
|             45 | _client_version | 10.0.5           |                3 |
|             45 | _platform       | x86_64           |                4 |
|             45 | program_name    | mysql            |                5 |
+----------------+-----------------+------------------+------------------+
```

Using Other Connectors

JDBC

Connection attributes values are set using the option connectionAttributes.

Example using connection string `jdbc:mariadb://localhost/?connectionAttributes=test:test1,test2:test2Val,test3`:

```
SELECT * FROM performance_schema.session_connect_attrs WHERE processlist_id=17;
+---------------+-----------------+---------------------+------------------+
| PROCESSLIST_ID | ATTR_NAME       | ATTR_VALUE          | ORDINAL_POSITION |
+---------------+-----------------+---------------------+------------------+
|             17 | _client_name    | MariaDB Connector/J |                0 |
|             17 | _client_version | 3.1.3               |                1 |
|             17 | _server_host    | localhost           |                2 |
|             17 | _os             | Windows 11          |                3 |
|             17 | _thread         | 1                   |                4 |
|             17 | _java_vendor    | Oracle Corporation  |                5 |
|             17 | _java_version   | 19.0.2              |                6 |
|             17 | test            | test1               |                7 |
|             17 | test2           | test2Val            |                8 |
|             17 | test3           | NULL                |                9 |
+---------------+-----------------+---------------------+------------------+
```

Node.js

Connection attributes values are set using the option connectAttributes.

Example using connection

```
const conn = await mariadb.createConnection({
  host: 'localhost',
  user: 'root',
  connectAttributes: { test: 'test1', test2: 'test2Val', test3: 'f' }
 });
```

```
SELECT * FROM performance_schema.session_connect_attrs WHERE processlist_id=30;
+---------------+-----------------+-----------------------+------------------+
| PROCESSLIST_ID | ATTR_NAME       | ATTR_VALUE            | ORDINAL_POSITION |
+---------------+-----------------+-----------------------+------------------+
|             30 | _client_name    | MariaDB connector/Node |                0 |
|             30 | _client_version | 3.1.1                 |                1 |
|             30 | _server_host    | ::1                   |                2 |
|             30 | _os             | win32                 |                3 |
|             30 | _client_host    | NOSTROMO              |                4 |
|             30 | _node_version   | 18.15.0               |                5 |
|             30 | test            | test1                 |                6 |
|             30 | test2           | test2Val              |                7 |
|             30 | test3           | f                     |                8 |
+---------------+-----------------+-----------------------+------------------+
```

R2DBC

Connection attributes values are set using the option connectionAttributes.

Example using connection string `jdbc:mariadb://localhost/?connectionAttributes=test:test1,test2:test2Val,test3`

```
TreeMap<String, String> connectionAttributes = new TreeMap<>();
    connectionAttributes.put("entry1", "val1");
    connectionAttributes.put("entry2", "val2");

     MariadbConnectionConfiguration conf = MariadbConnectionConfiguration.builder()
             .host("localhost")
             .port(3306)
             .username("root")
             .connectionAttributes(connectionAttributes)
             .database("test")
             .build();
     MariadbConnectionFactory connFactory = new MariadbConnectionFactory(conf);
     MariadbConnection connection = connFactory.create().block();
```

```
SELECT * FROM performance_schema.session_connect_attrs WHERE processlist_id=34;
+----------------+-----------------+--------------------+------------------+
| PROCESSLIST_ID | ATTR_NAME       | ATTR_VALUE         | ORDINAL_POSITION |
+----------------+-----------------+--------------------+------------------+
|             34 | _client_name    | mariadb            |                0 |
|             34 | _client_version | 1.1.4              |                1 |
|             34 | _server_host    | localhost          |                2 |
|             34 | _os             | Windows 11         |                3 |
|             34 | _thread         | 49                 |                4 |
|             34 | _java_vendor    | Oracle Corporation |                5 |

Performance Schema session_status Table

> **Note:**
>
> The `session_status` table is available from MariaDB 10.5.2.

The `session_status` table contains a list of status variables for the current session. The table only stores status variable statistics for threads which are instrumented, and does not collect statistics for `Com_xxx` variables.

The table contains the following columns:

Column	Description
VARIABLE_NAME	The session status variable name.
VARIABLE_VALUE	The session status variable value.

It is not possible to empty this table with a `TRUNCATE TABLE` statement.

Performance Schema setup_actors Table

The `setup_actors` table contains information for determining whether monitoring should be enabled for new client connection threads.

The default size is 100 rows, which can be changed by modifying the performance_schema_setup_actors_size system variable at server startup.

If a row in the table matches a new foreground thread's client and host, the matching `INSTRUMENTED` column in the threads table is set to either `YES` or `NO`, which allows selective application of instrumenting by host, by user, or combination thereof.

Column	Description
HOST	Host name, either a literal, or the % wildcard representing any host.
USER	User name, either a literal or the % wildcard representing any name.
ROLE	Unused

Initially, any user and host is matched:

```
SELECT * FROM performance_schema.setup_actors;
+------+------+------+
| HOST | USER | ROLE |
+------+------+------+
| %    | %    | %    |
+------+------+------+
```

Performance Schema setup_consumers Table

Lists the types of consumers for which event information is available.

The `setup_consumers` table contains the following columns:

Column	Description
NAME	Consumer name
ENABLED	YES or NO for whether or not the consumer is enabled. You can modify this column to ensure that event information is added, or is not added.

The table can be modified directly, or the server started with the option enabled, for example:

```
performance-schema-consumer-events-waits-history=ON
```

Example

```
SELECT * FROM performance_schema.setup_consumers;

+--------------------------------+---------+
| NAME                           | ENABLED |
+--------------------------------+---------+
| events_stages_current          | NO      |
| events_stages_history          | NO      |
| events_stages_history_long     | NO      |
| events_statements_current      | YES     |
| events_statements_history      | NO      |
| events_statements_history_long | NO      |
| events_waits_current           | NO      |
| events_waits_history           | NO      |
| events_waits_history_long      | NO      |
| global_instrumentation         | YES     |
| thread_instrumentation         | YES     |
| statements_digest              | YES     |
+--------------------------------+---------+
```

Performance Schema setup_instruments Table

The `setup_instruments` table contains a list of instrumented object classes for which it is possible to collect events. There is one row for each instrument in the source code. When an instrument is enabled and executed, instances are created which are then stored in the cond_instances, file_instances, mutex_instances, rwlock_instances or socket_instance tables.

It contains the following columns:

Column	Description
NAME	Instrument name
ENABLED	Whether or not the instrument is enabled. It can be disabled, and the instrument will produce no events.
TIMED	Whether or not the instrument is timed. It can be set, but if disabled, events produced by the instrument will have NULL values for the corresponding TIMER_START, TIMER_END, and TIMER_WAIT values.

Example

Default settings with the Performance Schema enabled:

```
SELECT * FROM setup_instruments ORDER BY name;
+-------------------------------------------------------------------------------------+---------+-------+
| NAME                                                                                | ENABLED | TIMED |
+-------------------------------------------------------------------------------------+---------+-------+
| idle                                                                                | YES     | YES   |
| memory/csv/blobroot                                                                 | NO      | NO    |
| memory/csv/row                                                                      | NO      | NO    |

Performance Schema setup_objects Table

Description

The `setup_objects` table determines whether objects are monitored by the performance schema or not. By default limited to 100 rows, this can be changed by setting the performance_schema_setup_objects_size system variable when the server starts.

It contains the following columns:

Column	Description
OBJECT_TYPE	Type of object to instrument, currently only . Currently, only TABLE', for base table.
OBJECT_SCHEMA	Schema containing the object, either the literal or % for any schema.
OBJECT_NAME	Name of the instrumented object, either the literal or % for any object.
ENABLED	Whether the object's events are instrumented or not. Can be disabled, in which case monitoring is not enabled for those objects.
TIMED	Whether the object's events are timed or not. Can be modified.

When the Performance Schema looks for matches in the `setup_objects`, there may be more than one row matching, with different `ENABLED` and `TIMED` values. It looks for the most specific matches first, that is, it will first

look for the specific database and table name combination, then the specific database, only then falling back to a wildcard for both.

Rows can be added or removed from the table, while for existing rows, only the `TIMED` and `ENABLED` columns can be updated. By default, all tables except those in the `performance_schema`, `information_schema` and `mysql` databases are instrumented.

This page is licensed: CC BY-SA / Gnu FDL

Performance Schema setup_timers Table

Description

The `setup_timers` table shows the currently selected event timers. Deprecated since 10.5, removed in 12.0.

It contains the following columns:

Column	Description
NAME	Type of instrument the timer is used for.
TIMER_NAME	Timer applying to the instrument type. Can be modified.

The `TIMER_NAME` value can be changed to choose a different timer, and can be any non-NULL value in the performance_timers.TIMER_NAME column.

If you modify the table, monitoring is immediately affected, and currently monitored events would use a combination of old and new timers, which is probably undesirable. It is best to reset the Performance Schema statistics if you make changes to this table.

Example

```
SELECT * FROM setup_timers;
+-----------+-------------+
| NAME      | TIMER_NAME  |
+-----------+-------------+
| idle      | MICROSECOND |
| wait      | CYCLE       |
| stage     | NANOSECOND  |
| statement | NANOSECOND  |
+-----------+-------------+
```

Performance Schema socket_instances Table

The `socket_instances` table lists active server connections, with each record being a Unix socket file or TCP/IP connection.

The `socket_instances` table contains the following columns:

Column	Description
EVENT_NAME	NAME from the setup_instruments table, and the name of the wait/io/socket/* instrument that produced the event.
OBJECT_INSTANCE_BEGIN	Memory address of the object.
THREAD_ID	Thread identifier that the server assigns to each socket.
SOCKET_ID	The socket's internal file handle.

Column	Description
IP	Client IP address. Blank for Unix socket file, otherwise an IPv4 or IPv6 address. Together with the PORT identifies the connection.
PORT	TCP/IP port number, from 0 to 65535. Together with the IP identifies the connection.
STATE	Socket status, either IDLE if waiting to receive a request from a client, or ACTIVE

Performance Schema socket_summary_by_event_name Table

It aggregates timer and byte count statistics for all socket I/O operations by socket instrument.

Column	Description
EVENT_NAME	Socket instrument.
COUNT_STAR	Number of summarized events
SUM_TIMER_WAIT	Total wait time of the summarized events that are timed.
MIN_TIMER_WAIT	Minimum wait time of the summarized events that are timed.
AVG_TIMER_WAIT	Average wait time of the summarized events that are timed.
MAX_TIMER_WAIT	Maximum wait time of the summarized events that are timed.
COUNT_READ	Number of all read operations, including RECV, RECVFROM, and RECVMSG.
SUM_TIMER_READ	Total wait time of all read operations that are timed.
MIN_TIMER_READ	Minimum wait time of all read operations that are timed.
AVG_TIMER_READ	Average wait time of all read operations that are timed.
MAX_TIMER_READ	Maximum wait time of all read operations that are timed.
SUM_NUMBER_OF_BYTES_READ	Bytes read by read operations.
COUNT_WRITE	Number of all write operations, including SEND, SENDTO, and SENDMSG.
SUM_TIMER_WRITE	Total wait time of all write operations that are timed.
MIN_TIMER_WRITE	Minimum wait time of all write operations that are timed.
AVG_TIMER_WRITE	Average wait time of all write operations that are timed.
MAX_TIMER_WRITE	Maximum wait time of all write operations that are timed.
SUM_NUMBER_OF_BYTES_WRITE	Bytes written by write operations.
COUNT_MISC	Number of all miscellaneous operations not counted above, including CONNECT, LISTEN, ACCEPT, CLOSE, and SHUTDOWN.
SUM_TIMER_MISC	Total wait time of all miscellaneous operations that are timed.
MIN_TIMER_MISC	Minimum wait time of all miscellaneous operations that are timed.
AVG_TIMER_MISC	Average wait time of all miscellaneous operations that are timed.
MAX_TIMER_MISC	Maximum wait time of all miscellaneous operations that are timed.

You can TRUNCATE the table, which will reset all counters to zero.

Example

```
SELECT * FROM socket_summary_by_event_name\G
*************************** 1. row ***************************
               EVENT_NAME: wait/io/socket/sql/server_tcpip_socket
               COUNT_STAR: 0

Performance Schema socket_summary_by_instance Table

It aggregates timer and byte count statistics for all socket I/O operations by socket instance.

Column	Description
EVENT_NAME	Socket instrument.
OBJECT_INSTANCE_BEGIN	Address in memory.
COUNT_STAR	Number of summarized events
SUM_TIMER_WAIT	Total wait time of the summarized events that are timed.

Column	Description
MIN_TIMER_WAIT	Minimum wait time of the summarized events that are timed.
AVG_TIMER_WAIT	Average wait time of the summarized events that are timed.
MAX_TIMER_WAIT	Maximum wait time of the summarized events that are timed.
COUNT_READ	Number of all read operations, including RECV, RECVFROM, and RECVMSG.
SUM_TIMER_READ	Total wait time of all read operations that are timed.
MIN_TIMER_READ	Minimum wait time of all read operations that are timed.
AVG_TIMER_READ	Average wait time of all read operations that are timed.
MAX_TIMER_READ	Maximum wait time of all read operations that are timed.
SUM_NUMBER_OF_BYTES_READ	Bytes read by read operations.
COUNT_WRITE	Number of all write operations, including SEND, SENDTO, and SENDMSG.
SUM_TIMER_WRITE	Total wait time of all write operations that are timed.
MIN_TIMER_WRITE	Minimum wait time of all write operations that are timed.
AVG_TIMER_WRITE	Average wait time of all write operations that are timed.
MAX_TIMER_WRITE	Maximum wait time of all write operations that are timed.
SUM_NUMBER_OF_BYTES_WRITE	Bytes written by write operations.
COUNT_MISC	Number of all miscellaneous operations not counted above, including CONNECT, LISTEN, ACCEPT, CLOSE, and SHUTDOWN.
SUM_TIMER_MISC	Total wait time of all miscellaneous operations that are timed.
MIN_TIMER_MISC	Minimum wait time of all miscellaneous operations that are timed.
AVG_TIMER_MISC	Average wait time of all miscellaneous operations that are timed.
MAX_TIMER_MISC	Maximum wait time of all miscellaneous operations that are timed.

The corresponding row in the table is deleted when a connection terminates.

You can TRUNCATE the table, which will reset all counters to zero.

Performance Schema status_by_account Table

> **Note:**
>
> The `status_by_account` table is available from MariaDB 10.5.2.

The `status_by_account` table contains status variable information by user/host account. The table does not collect statistics for `Com_xxx` variables.

The table contains the following columns:

Column	Description
USER	User for which the status variable is reported.
HOST	Host for which the status variable is reported.
VARIABLE_NAME	Status variable name.
VARIABLE_VALUE	Aggregated status variable value

If TRUNCATE TABLE is run, will aggregate the status from terminated sessions to user and host status, then reset the account status.

If FLUSH STATUS is run, session status from all active sessions are added to the global status variables, the status of all active sessions are reset, and values aggregated from disconnected sessions are reset.

This page is licensed: CC BY-SA / Gnu FDL

Performance Schema status_by_host Table

> **Note:**
>
> The `status_by_host` table is available from MariaDB 10.5.2.

The `status_by_host` table contains status variable information by host. The table does not collect statistics for `Com_xxx` variables.

The table contains the following columns:

Column	Description
HOST	Host for which the status variable is reported.
VARIABLE_NAME	Status variable name.
VARIABLE_VALUE	Aggregated status variable value

If TRUNCATE TABLE is run, will reset the aggregated host status from terminated sessions.

If FLUSH STATUS is run, session status from all active sessions are added to the global status variables, the status of all active sessions are reset, and values aggregated from disconnected sessions are reset.

This page is licensed: CC BY-SA / Gnu FDL

Performance Schema status_by_thread Table

> **Note:**
>
> The `session_status` table is available from MariaDB 10.5.2.

The `status_by_thread` table contains status variable information about active foreground threads. The table does not collect statistics for `Com_xxx` variables.

The table contains the following columns:

Column	Description
THREAD_ID	The thread identifier of the session in which the status variable is defined.
VARIABLE_NAME	Status variable name.
VARIABLE_VALUE	Aggregated status variable value.

If TRUNCATE TABLE is run, will aggregate the status for all threads to the global status and account status, then reset the thread status. If account statistics are not collected but host and user status are, the session status is added to host and user status.

This page is licensed: CC BY-SA / Gnu FDL

Performance Schema status_by_user Table

> **Note:**
>
> The `status_by_account` table is available from MariaDB 10.5.2.

The `status_by_account` table contains status variable information by user. The table does not collect statistics for `Com_xxx` variables.

The table contains the following columns:

Column	Description
USER	User for which the status variable is reported.
VARIABLE_NAME	Status variable name.
VARIABLE_VALUE	Aggregated status variable value

If TRUNCATE TABLE is run, will reset the aggregated user status from terminated sessions.

If FLUSH STATUS is run, session status from all active sessions are added to the global status variables, the status of all active sessions are reset, and values aggregated from disconnected sessions are reset.

This page is licensed: CC BY-SA / Gnu FDL

Performance Schema table_handles Table

> **Note:**
>
> The `table_handles` table is available from MariaDB 10.5.2.

The `table_handles` table contains table lock information. It uses the `wait/lock/table/sql/handler` instrument, which is enabled by default.

Information includes which table handles are open, which sessions are holding the locks, and how they are locked.

The table is read-only, and TRUNCATE TABLE cannot be performed on the table.

The maximum number of opened table objects is determined by the performance_schema_max_table_handles system variable.

The table contains the following columns:

Column	Description
OBJECT_TYPE	The table opened by a table handle.
OBJECT_SCHEMA	The schema that contains the object.
OBJECT_NAME	The name of the instrumented object.
OBJECT_INSTANCE_BEGIN	The table handle address in memory.
OWNER_THREAD_ID	The thread owning the table handle.
OWNER_EVENT_ID	The event which caused the table handle to be opened.
INTERNAL_LOCK	The table lock used at the SQL level.
EXTERNAL_LOCK	The table lock used at the storage engine level.

This page is licensed: CC BY-SA / Gnu FDL

Performance Schema table_io_waits_summary_by_index_usage Table

The `table_io_waits_summary_by_index_usage` table records table I/O waits by index.

Column	Description
OBJECT_TYPE	TABLE in the case of all indexes.
OBJECT_SCHEMA	Schema name.
OBJECT_NAME	Table name.
INDEX_NAME	Index name, or PRIMARY for the primary index, NULL for no index (inserts are counted in this case).
COUNT_STAR	Number of summarized events and the sum of the x_READ and x_WRITE columns.
SUM_TIMER_WAIT	Total wait time of the summarized events that are timed.
MIN_TIMER_WAIT	Minimum wait time of the summarized events that are timed.
AVG_TIMER_WAIT	Average wait time of the summarized events that are timed.
MAX_TIMER_WAIT	Maximum wait time of the summarized events that are timed.
COUNT_READ	Number of all read operations, and the sum of the equivalent x_FETCH columns.
SUM_TIMER_READ	Total wait time of all read operations that are timed.
MIN_TIMER_READ	Minimum wait time of all read operations that are timed.
AVG_TIMER_READ	Average wait time of all read operations that are timed.
MAX_TIMER_READ	Maximum wait time of all read operations that are timed.
COUNT_WRITE	Number of all write operations, and the sum of the equivalent x_INSERT, x_UPDATE and x_DELETE columns.
SUM_TIMER_WRITE	Total wait time of all write operations that are timed.
MIN_TIMER_WRITE	Minimum wait time of all write operations that are timed.
AVG_TIMER_WRITE	Average wait time of all write operations that are timed.
MAX_TIMER_WRITE	Maximum wait time of all write operations that are timed.
COUNT_FETCH	Number of all fetch operations.
SUM_TIMER_FETCH	Total wait time of all fetch operations that are timed.
MIN_TIMER_FETCH	Minimum wait time of all fetch operations that are timed.
AVG_TIMER_FETCH	Average wait time of all fetch operations that are timed.
MAX_TIMER_FETCH	Maximum wait time of all fetch operations that are timed.
COUNT_INSERT	Number of all insert operations.
SUM_TIMER_INSERT	Total wait time of all insert operations that are timed.
MIN_TIMER_INSERT	Minimum wait time of all insert operations that are timed.
AVG_TIMER_INSERT	Average wait time of all insert operations that are timed.
MAX_TIMER_INSERT	Maximum wait time of all insert operations that are timed.
COUNT_UPDATE	Number of all update operations.
SUM_TIMER_UPDATE	Total wait time of all update operations that are timed.
MIN_TIMER_UPDATE	Minimum wait time of all update operations that are timed.
AVG_TIMER_UPDATE	Average wait time of all update operations that are timed.
MAX_TIMER_UPDATE	Maximum wait time of all update operations that are timed.
COUNT_DELETE	Number of all delete operations.
SUM_TIMER_DELETE	Total wait time of all delete operations that are timed.
MIN_TIMER_DELETE	Minimum wait time of all delete operations that are timed.
AVG_TIMER_DELETE	Average wait time of all delete operations that are timed.
MAX_TIMER_DELETE	Maximum wait time of all delete operations that are timed.

You can TRUNCATE the table, which will reset all counters to zero. The table is also truncated if the table_io_waits_summary_by_table table is truncated.

If a table's index structure is changed, index statistics recorded in this table may also be reset.

This page is licensed: CC BY-SA / Gnu FDL

Performance Schema table_io_waits_summary_by_table Table

The `table_io_waits_summary_by_table` table records table I/O waits by table.

Column	Description
OBJECT_TYPE	Since this table records waits by table, always set to TABLE.
OBJECT_SCHEMA	Schema name.
OBJECT_NAME	Table name.
COUNT_STAR	Number of summarized events and the sum of the x_READ and x_WRITE columns.
SUM_TIMER_WAIT	Total wait time of the summarized events that are timed.
MIN_TIMER_WAIT	Minimum wait time of the summarized events that are timed.
AVG_TIMER_WAIT	Average wait time of the summarized events that are timed.
MAX_TIMER_WAIT	Maximum wait time of the summarized events that are timed.
COUNT_READ	Number of all read operations, and the sum of the equivalent x_FETCH columns.
SUM_TIMER_READ	Total wait time of all read operations that are timed.
MIN_TIMER_READ	Minimum wait time of all read operations that are timed.
AVG_TIMER_READ	Average wait time of all read operations that are timed.
MAX_TIMER_READ	Maximum wait time of all read operations that are timed.
COUNT_WRITE	Number of all write operations, and the sum of the equivalent x_INSERT, x_UPDATE and x_DELETE columns.
SUM_TIMER_WRITE	Total wait time of all write operations that are timed.
MIN_TIMER_WRITE	Minimum wait time of all write operations that are timed.
AVG_TIMER_WRITE	Average wait time of all write operations that are timed.
MAX_TIMER_WRITE	Maximum wait time of all write operations that are timed.
COUNT_FETCH	Number of all fetch operations.
SUM_TIMER_FETCH	Total wait time of all fetch operations that are timed.
MIN_TIMER_FETCH	Minimum wait time of all fetch operations that are timed.
AVG_TIMER_FETCH	Average wait time of all fetch operations that are timed.
MAX_TIMER_FETCH	Maximum wait time of all fetch operations that are timed.
COUNT_INSERT	Number of all insert operations.
SUM_TIMER_INSERT	Total wait time of all insert operations that are timed.
MIN_TIMER_INSERT	Minimum wait time of all insert operations that are timed.
AVG_TIMER_INSERT	Average wait time of all insert operations that are timed.
MAX_TIMER_INSERT	Maximum wait time of all insert operations that are timed.
COUNT_UPDATE	Number of all update operations.
SUM_TIMER_UPDATE	Total wait time of all update operations that are timed.
MIN_TIMER_UPDATE	Minimum wait time of all update operations that are timed.
AVG_TIMER_UPDATE	Average wait time of all update operations that are timed.

Column	Description
MAX_TIMER_UPDATE	Maximum wait time of all update operations that are timed.
COUNT_DELETE	Number of all delete operations.
SUM_TIMER_DELETE	Total wait time of all delete operations that are timed.
MIN_TIMER_DELETE	Minimum wait time of all delete operations that are timed.
AVG_TIMER_DELETE	Average wait time of all delete operations that are timed.
MAX_TIMER_DELETE	Maximum wait time of all delete operations that are timed.

You can TRUNCATE the table, which will reset all counters to zero. Truncating this table will also truncate the table_io_waits_summary_by_index_usage table.

Performance Schema table_lock_waits_summary_by_table Table

The `table_lock_waits_summary_by_table` table records table lock waits by table.

Column	Description
OBJECT_TYPE	Since this table records waits by table, always set to TABLE.
OBJECT_SCHEMA	Schema name.
OBJECT_NAME	Table name.
COUNT_STAR	Number of summarized events and the sum of the x_READ and x_WRITE columns.
SUM_TIMER_WAIT	Total wait time of the summarized events that are timed.
MIN_TIMER_WAIT	Minimum wait time of the summarized events that are timed.
AVG_TIMER_WAIT	Average wait time of the summarized events that are timed.
MAX_TIMER_WAIT	Maximum wait time of the summarized events that are timed.
COUNT_READ	Number of all read operations, and the sum of the equivalent x_READ_NORMAL, x_READ_WITH_SHARED_LOCKS, x_READ_HIGH_PRIORITY and x_READ_NO_INSERT columns.
SUM_TIMER_READ	Total wait time of all read operations that are timed.
MIN_TIMER_READ	Minimum wait time of all read operations that are timed.
AVG_TIMER_READ	Average wait time of all read operations that are timed.
MAX_TIMER_READ	Maximum wait time of all read operations that are timed.
COUNT_WRITE	Number of all write operations, and the sum of the equivalent x_WRITE_ALLOW_WRITE, x_WRITE_CONCURRENT_INSERT, x_WRITE_DELAYED, x_WRITE_LOW_PRIORITY and x_WRITE_NORMAL columns.
SUM_TIMER_WRITE	Total wait time of all write operations that are timed.
MIN_TIMER_WRITE	Minimum wait time of all write operations that are timed.
AVG_TIMER_WRITE	Average wait time of all write operations that are timed.
MAX_TIMER_WRITE	Maximum wait time of all write operations that are timed.
COUNT_READ_NORMAL	Number of all internal read normal locks.
SUM_TIMER_READ_NORMAL	Total wait time of all internal read normal locks that are timed.
MIN_TIMER_READ_NORMAL	Minimum wait time of all internal read normal locks that are timed.
AVG_TIMER_READ_NORMAL	Average wait time of all internal read normal locks that are timed.

Column	Description
MAX_TIMER_READ_NORMAL	Maximum wait time of all internal read normal locks that are timed.
COUNT_READ_WITH_SHARED_LOCKS	Number of all internal read with shared locks.
SUM_TIMER_READ_WITH_SHARED_LOCKS	Total wait time of all internal read with shared locks that are timed.
MIN_TIMER_READ_WITH_SHARED_LOCKS	Minimum wait time of all internal read with shared locks that are timed.
AVG_TIMER_READ_WITH_SHARED_LOCKS	Average wait time of all internal read with shared locks that are timed.
MAX_TIMER_READ_WITH_SHARED_LOCKS	Maximum wait time of all internal read with shared locks that are timed.
COUNT_READ_HIGH_PRIORITY	Number of all internal read high priority locks.
SUM_TIMER_READ_HIGH_PRIORITY	Total wait time of all internal read high priority locks that are timed.
MIN_TIMER_READ_HIGH_PRIORITY	Minimum wait time of all internal read high priority locks that are timed.
AVG_TIMER_READ_HIGH_PRIORITY	Average wait time of all internal read high priority locks that are timed.
MAX_TIMER_READ_HIGH_PRIORITY	Maximum wait time of all internal read high priority locks that are timed.
COUNT_READ_NO_INSERT	Number of all internal read no insert locks.
SUM_TIMER_READ_NO_INSERT	Total wait time of all internal read no insert locks that are timed.
MIN_TIMER_READ_NO_INSERT	Minimum wait time of all internal read no insert locks that are timed.
AVG_TIMER_READ_NO_INSERT	Average wait time of all internal read no insert locks that are timed.
MAX_TIMER_READ_NO_INSERT	Maximum wait time of all internal read no insert locks that are timed.
COUNT_READ_EXTERNAL	Number of all external read locks.
SUM_TIMER_READ_EXTERNAL	Total wait time of all external read locks that are timed.
MIN_TIMER_READ_EXTERNAL	Minimum wait time of all external read locks that are timed.
AVG_TIMER_READ_EXTERNAL	Average wait time of all external read locks that are timed.
MAX_TIMER_READ_EXTERNAL	Maximum wait time of all external read locks that are timed.
COUNT_WRITE_ALLOW_WRITE	Number of all internal read normal locks.
SUM_TIMER_WRITE_ALLOW_WRITE	Total wait time of all internal write allow write locks that are timed.
MIN_TIMER_WRITE_ALLOW_WRITE	Minimum wait time of all internal write allow write locks that are timed.

Column	Description
AVG_TIMER_WRITE_ALLOW_WRITE	Average wait time of all internal write allow write locks that are timed.
MAX_TIMER_WRITE_ALLOW_WRITE	Maximum wait time of all internal write allow write locks that are timed.
COUNT_WRITE_CONCURRENT_INSERT	Number of all internal concurrent insert write locks.
SUM_TIMER_WRITE_CONCURRENT_INSERT	Total wait time of all internal concurrent insert write locks that are timed.
MIN_TIMER_WRITE_CONCURRENT_INSERT	Minimum wait time of all internal concurrent insert write locks that are timed.
AVG_TIMER_WRITE_CONCURRENT_INSERT	Average wait time of all internal concurrent insert write locks that are timed.
MAX_TIMER_WRITE_CONCURRENT_INSERT	Maximum wait time of all internal concurrent insert write locks that are timed.
COUNT_WRITE_DELAYED	Number of all internal write delayed locks.
SUM_TIMER_WRITE_DELAYED	Total wait time of all internal write delayed locks that are timed.
MIN_TIMER_WRITE_DELAYED	Minimum wait time of all internal write delayed locks that are timed.
AVG_TIMER_WRITE_DELAYED	Average wait time of all internal write delayed locks that are timed.
MAX_TIMER_WRITE_DELAYED	Maximum wait time of all internal write delayed locks that are timed.
COUNT_WRITE_LOW_PRIORITY	Number of all internal write low priority locks.
SUM_TIMER_WRITE_LOW_PRIORITY	Total wait time of all internal write low priority locks that are timed.
MIN_TIMER_WRITE_LOW_PRIORITY	Minimum wait time of all internal write low priority locks that are timed.
AVG_TIMER_WRITE_LOW_PRIORITY	Average wait time of all internal write low priority locks that are timed.
MAX_TIMER_WRITE_LOW_PRIORITY	Maximum wait time of all internal write low priority locks that are timed.
COUNT_WRITE_NORMAL	Number of all internal write normal locks.
SUM_TIMER_WRITE_NORMAL	Total wait time of all internal write normal locks that are timed.
MIN_TIMER_WRITE_NORMAL	Minimum wait time of all internal write normal locks that are timed.
AVG_TIMER_WRITE_NORMAL	Average wait time of all internal write normal locks that are timed.
MAX_TIMER_WRITE_NORMAL	Maximum wait time of all internal write normal locks that are timed.
COUNT_WRITE_EXTERNAL	Number of all external write locks.
SUM_TIMER_WRITE_EXTERNAL	Total wait time of all external write locks that are timed.

Column	Description
MIN_TIMER_WRITE_EXTERNAL	Minimum wait time of all external write locks that are timed.
AVG_TIMER_WRITE_EXTERNAL	Average wait time of all external write locks that are timed.
MAX_TIMER_WRITE_EXTERNAL	Maximum wait time of all external write locks that are timed.

You can TRUNCATE the table, which will reset all counters to zero.

Performance Schema threads Table

Each server thread is represented as a row in the `threads` table.

The `threads` table contains the following columns:

Column	Description
THREAD_ID	A unique thread identifier.
NAME	Name associated with the server's thread instrumentation code, for example thread/sql/main for the server's main() function, and thread/sql/one_connection for a user connection.
TYPE	FOREGROUND or BACKGROUND, depending on the thread type. User connection threads are FOREGROUND, internal server threads are BACKGROUND.
PROCESSLIST_ID	The PROCESSLIST.ID value for threads displayed in the INFORMATION_SCHEMA.PROCESSLIST table, or 0 for background threads. Also corresponds with the CONNECTION_ID() return value for the thread.
PROCESSLIST_USER	Foreground thread user, or NULL for a background thread.
PROCESSLIST_HOST	Foreground thread host, or NULL for a background thread.
PROCESSLIST_DB	Thread's default database, or NULL if none exists.
PROCESSLIST_COMMAND	Type of command executed by the thread. These correspond to the COM_xxx client/server protocol commands, and the Com_xxx status variables. See Thread Command Values.
PROCESSLIST_TIME	Time in seconds the thread has been in its current state.
PROCESSLIST_STATE	Action, event or state indicating what the thread is doing.
PROCESSLIST_INFO	Statement being executed by the thread, or NULL if a statement is not being executed. If a statement results in calling other statements, such as for a stored procedure, the innermost statement from the stored procedure is shown here.
PARENT_THREAD_ID	THREAD_ID of the parent thread, if any. Subthreads can for example be spawned as a result of INSERT DELAYED statements.

Column	Description
ROLE	Unused.
INSTRUMENTED	YES or NO for Whether the thread is instrumented or not. For foreground threads, the initial value is determined by whether there's a user/host match in the setup_actors table. Subthreads are again matched, while for background threads, this will be set to YES by default. To monitor events that the thread executes, INSTRUMENTED must be YES and the thread_instrumentation consumer in the setup_consumers table must also be YES.
HISTORY	YES or NO for Whether to log historical events for the thread. For foreground threads, the initial value is determined by whether there's a user/host match in the setup_actors table. Subthreads are again matched, while for background threads, this will be set to YES by default. To monitor events that the thread executes, INSTRUMENTED must be YES and the thread_instrumentation consumer in the setup_consumers table must also be YES. Added in MariaDB 10.5.
CONNECTION_TYPE	The protocol used to establish the connection. One of TCP/IP, SSL/TLS, Socket, Named Pipe, Shared Memory, or NULL for background threads. Added in MariaDB 10.5.
THREAD_OS_ID	The thread or task identifier as defined by the underlying operating system, if there is one. Added in MariaDB 10.5

Example

```
SELECT * FROM performance_schema.threads\G;
*************************** 1. row ***************************
          THREAD_ID: 1
               NAME: thread/sql/main
               TYPE: BACKGROUND
     PROCESSLIST_ID: NULL
   PROCESSLIST_USER: NULL
   PROCESSLIST_HOST: NULL
     PROCESSLIST_DB: NULL
PROCESSLIST_COMMAND: NULL
   PROCESSLIST_TIME: 215859
  PROCESSLIST_STATE: Table lock
   PROCESSLIST_INFO: INTERNAL DDL LOG RECOVER IN PROGRESS
   PARENT_THREAD_ID: NULL
               ROLE: NULL
       INSTRUMENTED: YES
...
*************************** 21. row ***************************
          THREAD_ID: 64
               NAME: thread/sql/one_connection
               TYPE: FOREGROUND
     PROCESSLIST_ID: 44
   PROCESSLIST_USER: root
   PROCESSLIST_HOST: localhost
     PROCESSLIST_DB: NULL
PROCESSLIST_COMMAND: Query
   PROCESSLIST_TIME: 0
  PROCESSLIST_STATE: Sending data
   PROCESSLIST_INFO: SELECT * FROM performance_schema.threads
   PARENT_THREAD_ID: NULL
               ROLE: NULL
       INSTRUMENTED: YES
```

This page is licensed: CC BY-SA / Gnu FDL

Performance Schema users Table

Description

Each user that connects to the server is stored as a row in the `users` table, along with current and total connections.

The table size is determined at startup by the value of the performance_schema_users_size system variable. If this is set to `0`, user statistics will be disabled.

Column	Description
USER	The connection's client user name for the connection, or NULL if an internal thread.
CURRENT_CONNECTIONS	Current connections for the user.
TOTAL_CONNECTIONS	Total connections for the user.

Example

```
SELECT * FROM performance_schema.users;
+-----------------+---------------------+-------------------+
| USER            | CURRENT_CONNECTIONS | TOTAL_CONNECTIONS |
+-----------------+---------------------+-------------------+
| debian-sys-maint |                   0 |                35 |
| NULL            |                  20 |                23 |
| root            |                   1 |                 2 |
+-----------------+---------------------+-------------------+
```

This page is licensed: CC BY-SA / Gnu FDL

Performance Schema user_variables_by_thread Table

> **Note:**
>
> The `user_variables_by_thread` table is available from MariaDB 10.5.2.

The `user_variables_by_thread` table contains information about user-defined variables and the threads that defined them.

TRUNCATE TABLE cannot be performed on the table.

The table contains the following columns:

Column	Description
THREAD_ID	The thread identifier of the session in which the variable is defined.
VARIABLE_NAME	The variable name, without the leading @ character.
VARIABLE_VALUE	The variable value

Example

```
SET @var = 0;

SELECT * FROM user_variables_by_thread;
+-----------+---------------+----------------+
| THREAD_ID | VARIABLE_NAME | VARIABLE_VALUE |
+-----------+---------------+----------------+
|        11 | var           | 0              |
+-----------+---------------+----------------+
```

This page is licensed: CC BY-SA / Gnu FDL

Sys Schema sys_config Table

> **Note:**
>
> Sys Schema is available from MariaDB 10.6.

The *sys.sys_config* table holds configuration options for the Sys Schema.

This is a persistent table (using the Aria storage engine), with the configuration persisting across upgrades (new options are added with INSERT IGNORE.

The table also has two related triggers, which maintain the user that INSERTs or UPDATEs the configuration - sys_config_insert_set_user and sys_config_update_set_user respectively.

Its structure is as follows:

```
+----------+--------------+------+-----+-------------------+-----------------------------+
| Field    | Type         | Null | Key | Default           | Extra                       |
+----------+--------------+------+-----+-------------------+-----------------------------+
| variable | varchar(128) | NO   | PRI | NULL              |                             |
| value    | varchar(128) | YES  |     | NULL              |                             |
| set_time | timestamp    | NO   |     | CURRENT_TIMESTAMP | on update CURRENT_TIMESTAMP |
| set_by   | varchar(128) | YES  |     | NULL              |                             |
+----------+--------------+------+-----+-------------------+-----------------------------+
```

> **Warning:**
>
> Note, when functions check for configuration options, they first check whether a similar named user variable exists with a value, and if this is not set then pull the configuration option from this table in to that named user variable. This is done for performance reasons (to not continually `SELECT` from the table), however this comes with the side effect that once inited, the values last with the session, somewhat like how session variables are inited from global variables. If the values within this table are changed, they will not take effect until the user logs in again.

Options Included

Variable	Default Value	Description
statement_truncate_len	64	Sets the size to truncate statements to, for the format_statement function.
statement_performance_analyzer.limit	100	The maximum number of rows to include for the views that does not have a built-in limit (e.g. the 95th percentile view). If not set the limit is 100.
statement_performance_analyzer.view	NULL	Used together with the 'custom' view. If the value contains a space, it is considered a query, otherwise it must be an existing view querying the performance_schema.events_statements_summary_by_digest table.
diagnostics.allow_is_tables	OFF	Specifies whether it is allowed to do table scan queries on information_schema.TABLES for the diagnostics procedure.
diagnostics.include_raw	OFF	Set to 'ON' to include the raw data (e.g. the original output of "SELECT * FROM sys.metrics") for the diagnostics procedure.
ps_thread_trx_info.max_length	65535	Sets the maximum output length for JSON object output by the ps_thread_trx_info() function.

Notes

Some early versions of *sys_config* were stored in InnoDB format.

extract_schema_from_file_name

> **Note:**
>
> Sys Schema is available from MariaDB 10.6.

Syntax

```
sys.extract_schema_from_file_name(path)
```

Description

`extract_schema_from_file_name` is a stored function available with the Sys Schema.

Given a file path, it returns the schema (database) name. The file name is assumed to be within the schema directory, and therefore the function will not return the expected result with partitions, or when tables are defined using the DATA_DIRECTORY table option.

The function does not examine anything on disk. The return value, a VARCHAR(64), is determined solely from the provided path.

Examples

```
SELECT sys.extract_schema_from_file_name('/usr/local/mysql/data/db/t1.ibd');
+---------------------------------------------------------------------+
| sys.extract_schema_from_file_name('/usr/local/mysql/data/db/t1.ibd') |
+---------------------------------------------------------------------+

extract_table_from_file_name

> **Note:**
>
> Sys Schema is available from MariaDB 10.6.

Syntax

```
sys.extract_table_from_file_name(path)
```

Description

`extract_table_from_file_name` is a stored function available with the Sys Schema.

Given a file path, it returns the table name.

The function does not examine anything on disk. The return value, a VARCHAR(64), is determined solely from the provided path.

Examples

```
SELECT sys.extract_table_from_file_name('/usr/local/mysql/data/db/t1.ibd');
+---------------------------------------------------------------------+
| sys.extract_table_from_file_name('/usr/local/mysql/data/db/t1.ibd') |
+---------------------------------------------------------------------+
| t1                                                                  |
+---------------------------------------------------------------------+
```

format_bytes

> **Note:**
>
> Sys Schema is available from MariaDB 10.6.

Syntax

```
sys.format_bytes(double)
```

Description

`format_bytes` is a stored function available with the Sys Schema.

Given a byte count, returns a string consisting of a value and the units in a human-readable format. The units will be in bytes, KiB (kibibytes), MiB (mebibytes), GiB (gibibytes), TiB (tebibytes), or PiB (pebibytes).

The binary prefixes (kibi, mebi, gibi, tebi and pebi) were created in December 1998 by the International Electrotechnical Commission to avoid possible ambiguity, as the widely-used prefixes kilo, mega, giga, tera and peta can be used to refer to both the power-of-10 decimal system multipliers and the power-of-two binary system multipliers.

From MariaDB 11.8, the built-in FORMAT_BYTES function can instead be used. The functions are similar, except that `FORMAT_BYTES` also displays exbibytes.

Examples

```
SELECT sys.format_bytes(1000),sys.format_bytes(1024);
+-----------------------+-----------------------+
| sys.format_bytes(1000) | sys.format_bytes(1024) |
+-----------------------+-----------------------+
| 1000 bytes             | 1.00 KiB              |
+-----------------------+-----------------------+

SELECT sys.format_bytes(1000000),sys.format_bytes(1048576);
+--------------------------+--------------------------+
| sys.format_bytes(1000000) | sys.format_bytes(1048576) |
+--------------------------+--------------------------+
| 976.56 KiB               | 1.00 MiB                 |
+--------------------------+--------------------------+

SELECT sys.format_bytes(1000000000),sys.format_bytes(1073741874);
+-----------------------------+-----------------------------+
| sys.format_bytes(1000000000) | sys.format_bytes(1073741874) |
+-----------------------------+-----------------------------+
| 953.67 MiB                  | 1.00 GiB                    |
+-----------------------------+-----------------------------+

SELECT sys.format_bytes(1000000000000),sys.format_bytes(1099511627776);
+--------------------------------+--------------------------------+
| sys.format_bytes(1000000000000) | sys.format_bytes(1099511627776) |
+--------------------------------+--------------------------------+
| 931.32 GiB                     | 1.00 TiB                       |
+--------------------------------+--------------------------------+

SELECT sys.format_bytes(1000000000000000),sys.format_bytes(1125899906842624);
+-----------------------------------+-----------------------------------+
| sys.format_bytes(1000000000000000) | sys.format_bytes(1125899906842624) |
+-----------------------------------+-----------------------------------+
| 909.49 TiB                        | 1.00 PiB                          |
+-----------------------------------+-----------------------------------+
```

format_path

> **Note:**
>
> Sys Schema is available from MariaDB 10.6.

Syntax

```
sys.format_path(path)
```

Description

`format_path` is a stored function available with the Sys Schema that, given a path, returns a modified path after replacing subpaths matching the values of various system variables with the variable name.

The system variables that are matched are, in order:

- datadir
- tmpdir
- slave_load_tmpdir
- innodb_data_home_dir
- innodb_log_group_home_dir
- innodb_undo_directory

- basedir

Examples

```
SELECT @@tmpdir;
+-----------------------------------+
| @@tmpdir                          |
+-----------------------------------+
| /home/ian/sandboxes/msb_10_8_2/tmp |
+-----------------------------------+

SELECT sys.format_path('/home/ian/sandboxes/msb_10_8_2/tmp/testdb.ibd');
+-------------------------------------------------------------------+
| sys.format_path('/home/ian/sandboxes/msb_10_8_2/tmp/testdb.ibd') |
+-------------------------------------------------------------------+
| @@tmpdir/testdb.ibd                                               |
+-------------------------------------------------------------------+
```

This page is licensed: CC BY-SA / Gnu FDL

format_statement

> **Note:**
>
> Sys Schema is available from MariaDB 10.6.

Syntax

```
sys.format_statement(statement)
```

Description

Returns a reduced length string. The length is specified by the statement_truncate_len configuration option (default 64), and the removed part of the string (if any) is replaced with an ellipsis (three dots).

The function is intended for use in formatting lengthy SQL statements to a fixed length.

Examples

Default truncation length 64:

```
SELECT sys.format_statement(
  'SELECT field1, field2, field3, field4, field5, field6 FROM table1'
  ) AS formatted_statement;
+-------------------------------------------------------------------+
| formatted_statement                                               |
+-------------------------------------------------------------------+
| SELECT field1, field2, field3, ... d4, field5, field6 FROM table1 |
+-------------------------------------------------------------------+
```

Reducing the truncation length to 48:

```
SET @sys.statement_truncate_len = 48;

SELECT sys.format_statement(
  'SELECT field1, field2, field3, field4, field5, field6 FROM table1'
  ) AS formatted_statement;
+-------------------------------------------------+
| formatted_statement                             |
+-------------------------------------------------+
| SELECT field1, field2, ... d5, field6 FROM table1 |
+-------------------------------------------------+
```

This page is licensed: CC BY-SA / Gnu FDL

format_time

> **Note:**
>
> Sys Schema is available from MariaDB 10.6.

Syntax

```
sys.format_time(picoseconds)
```

Description

`format_time` is a stored function available with the Sys Schema. Given a time in picoseconds, returns a human-readable time value and unit indicator. Unit can be:

- ps - picoseconds
- ns - nanoseconds
- us - microseconds
- ms - milliseconds
- s - seconds
- m - minutes
- h - hours
- d - days
- w - weeks

This function is very similar to the FORMAT_PICO_TIME function introduced in MariaDB 11.0.2, but with the following differences:

- Represents minutes as `m` rather than `min`.
- Represent weeks.

Examples

```
SELECT
    sys.format_time(43) AS ps,
    sys.format_time(4321) AS ns,
    sys.format_time(43211234) AS us,
    sys.format_time(432112344321) AS ms,
    sys.format_time(43211234432123) AS s,
    sys.format_time(432112344321234) AS m,
    sys.format_time(4321123443212345) AS h,
    sys.format_time(43211234432123545) AS d,
    sys.format_time(432112344321234543) AS w;
+-------+---------+----------+-----------+---------+--------+--------+--------+---------+
| ps    | ns      | us       | ms        | s       | m      | h      | d      | w       |
+-------+---------+----------+-----------+---------+--------+--------+--------+---------+
| 43 ps | 4.32 ns | 43.21 us | 432.11 ms | 43.21 s | 7.20 m | 1.20 h | 5.00 d | 71.45 w |
+-------+---------+----------+-----------+---------+--------+--------+--------+---------+
```

list_add

> **Note:**
>
> Sys Schema is available from MariaDB 10.6.

Syntax

```
sys.list_add(list,value)
```

Description

`list_add` is a stored function available with the Sys Schema.

It takes a *list* to be modified and a *value* to be added to the list, returning the resulting value. This can be used, for example, to add a value to a system variable taking a comma-delimited list of options, such as sql_mode.

The related function list_drop can be used to drop a value from a list.

Examples

```
SELECT @@sql_mode;
+-----------------------------------------------------------------------+
| @@sql_mode                                                            |
+-----------------------------------------------------------------------+
| STRICT_TRANS_TABLES,ERROR_FOR_DIVISION_BY_ZERO,
NO_AUTO_CREATE_USER,NO_ENGINE_SUBSTITUTION |
+-----------------------------------------------------------------------+

SET @@sql_mode = sys.list_add(@@sql_mode, 'NO_ZERO_DATE');

SELECT @@sql_mode;
+-----------------------------------------------------------------------+
| @@sql_mode                                                            |
+-----------------------------------------------------------------------+
| STRICT_TRANS_TABLES,NO_ZERO_DATE,ERROR_FOR_DIVISION_BY_ZERO,
NO_AUTO_CREATE_USER,NO_ENGINE_SUBSTITUTION |
+-----------------------------------------------------------------------+
```

list_drop

> **Note:**
>
> Sys Schema is available from MariaDB 10.6.

Syntax

```
sys.list_drop(list,value)
```

Description

`list_drop` is a stored function available with the Sys Schema.

It takes a *list* to be modified and a *value* to be dropped from the list, returning the resulting value. This can be used, for example, to remove a value from a system variable taking a comma-delimited list of options, such as sql_mode.

The related function list_add can be used to add a value to a list.

Examples

```
SELECT @@sql_mode;
+-------------------------------------------------------------------------+
| @@sql_mode                                                              |

ps_is_account_enabled

> **Note:**
>
> Sys Schema is available from MariaDB 10.6.

Syntax

```
sys.ps_is_account_enabled(host,user)
```

Description

`ps_is_account_enabled` is a stored function available with the Sys Schema.

It takes *host* and *user* arguments, and returns an ENUM('YES','NO') depending on whether Performance Schema instrumentation for the given account is enabled.

Examples

```
SELECT sys.ps_is_account_enabled('localhost', 'root');
+-----------------------------------------------+
| sys.ps_is_account_enabled('localhost', 'root') |
+-----------------------------------------------+
| YES                                           |
+-----------------------------------------------+
```

ps_is_consumer_enabled

> **Note:**
>
> Sys Schema is available from MariaDB 10.6.

Syntax

```
sys.ps_is_consumer_enabled(consumer)
```

Description

`ps_is_consumer_enabled` is a stored function available with the Sys Schema.

It returns an ENUM('YES','NO') depending on whether Performance Schema instrumentation for the given consumer is enabled, and NULL if not given a valid consumer name.

Examples

```
SELECT sys.ps_is_consumer_enabled('global_instrumentation');
+-----------------------------------------------------+
| sys.ps_is_consumer_enabled('global_instrumentation') |
+-----------------------------------------------------+
| YES                                                  |
+-----------------------------------------------------+

SELECT sys.ps_is_consumer_enabled('events_stages_current');
+-----------------------------------------------------+
| sys.ps_is_consumer_enabled('events_stages_current') |
+-----------------------------------------------------+
| NO                                                  |
+-----------------------------------------------------+

SELECT sys.ps_is_consumer_enabled('nonexistent_consumer');
+-----------------------------------------------------+
| sys.ps_is_consumer_enabled('nonexistent_consumer') |
+-----------------------------------------------------+
| NULL                                                |
+-----------------------------------------------------+
```

ps_is_instrument_default_enabled

> **Note:**
>
> Sys Schema is available from MariaDB 10.6.

Syntax

```
sys.ps_is_instrument_default_enabled(instrument)
```

Description

`ps_is_instrument_default_enabled` is a stored function available with the Sys Schema.

It returns `YES` if the given Performance Schema *instrument* is enabled by default, and `NO` if it is not, does not exist, or is a NULL value.

Examples

```
SELECT sys.ps_is_instrument_default_enabled('statement/sql/select');
+-------------------------------------------------------------+
| sys.ps_is_instrument_default_enabled('statement/sql/select') |
+-------------------------------------------------------------+
| YES                                                          |
+-------------------------------------------------------------+

SELECT sys.ps_is_instrument_default_enabled('memory/sql/udf_mem');
+-----------------------------------------------------------+
| sys.ps_is_instrument_default_enabled('memory/sql/udf_mem') |
+-----------------------------------------------------------+
| NO                                                        |
+-----------------------------------------------------------+

SELECT sys.ps_is_instrument_default_enabled('memory/sql/nonexistent');
+--------------------------------------------------------------+
| sys.ps_is_instrument_default_enabled('memory/sql/nonexistent') |
+--------------------------------------------------------------+
| NO                                                           |
+--------------------------------------------------------------+

SELECT sys.ps_is_instrument_default_enabled(NULL);
+-----------------------------------------+
| sys.ps_is_instrument_default_enabled(NULL) |
+-----------------------------------------+
| NO                                      |

ps_is_instrument_default_timed

> **Note:**
>
> Sys Schema is available from MariaDB 10.6.

Syntax

```
sys.ps_is_instrument_default_timed(instrument)
```

Description

`ps_is_instrument_default_timed` is a stored function available with the Sys Schema.

It returns `YES` if the given Performance Schema *instrument* is timed by default, and `NO` if it is not, does not exist, or is a `NULL` value.

Examples

```
SELECT sys.ps_is_instrument_default_timed('statement/sql/select');
+-----------------------------------------------------------+
| sys.ps_is_instrument_default_timed('statement/sql/select') |
+-----------------------------------------------------------+
| YES                                                       |
+-----------------------------------------------------------+

SELECT sys.ps_is_instrument_default_timed('memory/sql/udf_mem');
+---------------------------------------------------------+
| sys.ps_is_instrument_default_timed('memory/sql/udf_mem') |
+---------------------------------------------------------+
| NO                                                      |
+---------------------------------------------------------+

SELECT sys.ps_is_instrument_default_timed('memory/sql/nonexistent');
+-------------------------------------------------------------+
| sys.ps_is_instrument_default_timed('memory/sql/udf_memsds') |
+-------------------------------------------------------------+
| NO                                                          |
+-------------------------------------------------------------+

SELECT sys.ps_is_instrument_default_timed(NULL);
+-----------------------------------------+
| sys.ps_is_instrument_default_timed(NULL) |
+-----------------------------------------+
| NO                                      |
+-----------------------------------------+
```

ps_is_thread_instrumented

> **Note:**
>
> Sys Schema is available from MariaDB 10.6.

Syntax

```
sys.ps_is_thread_instrumented(connection_id)
```

Description

`ps_is_thread_instrumented` is a stored function available with the Sys Schema that returns whether or not Performance Schema instrumentation for the given *connection_id* is enabled.

- `YES` - instrumentation is enabled
- `NO` - instrumentation is not enabled
- `UNKNOWN` - the connection ID is unknown
- `NULL` - `NULL` value

Examples

```
SELECT sys.ps_is_thread_instrumented(CONNECTION_ID());
+-----------------------------------------------+
| sys.ps_is_thread_instrumented(CONNECTION_ID()) |
+-----------------------------------------------+
| YES                                           |
+-----------------------------------------------+

SELECT sys.ps_is_thread_instrumented(2042);
+-------------------------------------+
| sys.ps_is_thread_instrumented(2042) |
+-------------------------------------+
| UNKNOWN                             |
+-------------------------------------+

SELECT sys.ps_is_thread_instrumented(NULL);
+-------------------------------------+
| sys.ps_is_thread_instrumented(NULL) |
+-------------------------------------+
| NULL                                |
+-------------------------------------+
```

This page is licensed: CC BY-SA / Gnu FDL

ps_thread_account

> **Note:**
>
> Sys Schema is available from MariaDB 10.6.

Syntax

```
sys.ps_thread_account(thread_id)
```

Description

`ps_thread_account` is a stored function available with the Sys Schema that returns the account (username@hostname) associated with the given *thread_id*.

Returns `NULL` if the thread_id is not found.

Examples

```
SELECT sys.ps_thread_account(sys.ps_thread_id(CONNECTION_ID()));
+-----------------------------------------------------------+
| sys.ps_thread_account(sys.ps_thread_id(CONNECTION_ID())) |
+-----------------------------------------------------------+
| msandbox@localhost                                        |
+-----------------------------------------------------------+

SELECT sys.ps_thread_account(sys.ps_thread_id(2042));
+-----------------------------------------------+
| sys.ps_thread_account(sys.ps_thread_id(2042)) |
+-----------------------------------------------+
| NULL                                          |
+-----------------------------------------------+

SELECT sys.ps_thread_account(sys.ps_thread_id(NULL));
+-----------------------------------------------+
| sys.ps_thread_account(sys.ps_thread_id(NULL)) |
+-----------------------------------------------+
| msandbox@localhost                            |
+-----------------------------------------------+
```

ps_thread_id

> **Note:**
>
> Sys Schema is available from MariaDB 10.6.

Syntax

```
sys.ps_thread_id(connection_id)
```

Description

`ps_thread_id` is a stored function available with the Sys Schema that returns the thread_id associated with the given *connection_id*. If the *connection_id* is `NULL`, returns the thread_id for the current connection.

Examples

```
SELECT * FROM performance_schema.threads\G
*************************** 13. row ***************************
          THREAD_ID: 13
               NAME: thread/sql/one_connection
               TYPE: FOREGROUND
     PROCESSLIST_ID: 3
   PROCESSLIST_USER: msandbox
   PROCESSLIST_HOST: localhost
     PROCESSLIST_DB: test
PROCESSLIST_COMMAND: Query
   PROCESSLIST_TIME: 0
  PROCESSLIST_STATE: Sending data
   PROCESSLIST_INFO: SELECT * FROM performance_schema.threads
   PARENT_THREAD_ID: 1
               ROLE: NULL
       INSTRUMENTED: YES
            HISTORY: YES
    CONNECTION_TYPE: Socket
       THREAD_OS_ID: 24379

SELECT sys.ps_thread_id(3);
+---------------------+
| sys.ps_thread_id(3) |
+---------------------+
|                  13 |
+---------------------+

SELECT sys.ps_thread_id(NULL);
+------------------------+
| sys.ps_thread_id(NULL) |
+------------------------+
|                     13 |
+------------------------+
```

ps_thread_stack

> **Note:**
>
> Sys Schema is available from MariaDB 10.6.

Syntax

```
sys.ps_thread_stack(thread_id, verbose)
```

Description

`ps_thread_stack` is a stored function available with the Sys Schema that, for a given *thread_id*, returns all statements, stages, and events within the Performance Schema, as a JSON formatted stack.

The boolean *verbose* argument specifies whether or not to include `file:lineno` information in the events.

Examples

```
SELECT sys.ps_thread_stack(13, FALSE) AS thread_stack\G
*************************** 1. row ***************************
thread_stack: {"rankdir": "LR","nodesep": "0.10",
  "stack_created": "2022-03-28 16:01:06",
  "mysql_version": "10.8.2-MariaDB",
  "mysql_user": "msandbox@localhost",
  "events": []}
```

This page is licensed: CC BY-SA / Gnu FDL

ps_thread_trx_info

> **Note:**
>
> Sys Schema is available from MariaDB 10.6.

Syntax

```
sys.ps_thread_trx_info(thread_id)
```

Description

`ps_thread_trx_info` is a stored function available with the Sys Schema.

It returns a JSON object with information about the thread specified by the given *thread_id*. This information includes:

- the current transaction;
- executed statements (derived from the Performance Schema events_transactions_current Table and the Performance Schema events_statements_history Table (full data will only returned if the consumers for those tables are enabled).

The maximum length of the returned JSON object is determined by the value of the ps_thread_trx_info.max_length sys_config option (by default 65535). If the returned value exceeds this length, a JSON object error is returned.

quote_identifier

> **Note:**
>
> Sys Schema is available from MariaDB 10.6.

Syntax

```
sys.quote_identifier(str)
```

Description

`quote_identifier` is a stored function available with the Sys Schema.

It quotes a string to produce a result that can be used as an identifier in an SQL statement. The string is returned enclosed by backticks (“`") and with each instance of backtick ("`”) doubled. If the argument is `NULL`, the

return value is the word "`NULL`" without enclosing backticks.

Examples

```
SELECT sys.quote_identifier("Identifier with spaces");
+-----------------------------------------------+
| sys.quote_identifier("Identifier with spaces") |
+-----------------------------------------------+
| `Identifier with spaces`                      |
+-----------------------------------------------+

SELECT sys.quote_identifier("Identifier` containing `backticks");
+-------------------------------------------------------------+
| sys.quote_identifier("Identifier` containing `backticks") |
+-------------------------------------------------------------+
| `Identifier`` containing ``backticks`                      |
+-------------------------------------------------------------+
```

sys_get_config

> **Note:**
>
> Sys Schema is available from MariaDB 10.6.

Syntax

```
sys.sys_get_config(name,default)
```

Description

`sys_get_config` is a stored function available with the Sys Schema.

The function returns a configuration option value from the sys_config table. It takes two arguments; *name*, a configuration option name, and *default*, which is returned if the given option does not exist in the table.

Both arguments are `VARCHAR(128)` and can be `NULL`. Returns `NULL` if *name* is `NULL`, or if the given option is not found and *default* is `NULL`.

Examples

```
SELECT sys.sys_get_config('ps_thread_trx_info.max_length',NULL);
+-----------------------------------------------------------+
| sys.sys_get_config('ps_thread_trx_info.max_length',NULL) |
+-----------------------------------------------------------+
| 65535                                                     |
+-----------------------------------------------------------+
```

version_major

> **Note:**
>
> Sys Schema is available from MariaDB 10.6.

Syntax

```
sys.version_major()
```

Description

`version_major` is a stored function available with the Sys Schema.

It returns the MariaDB Server major release version.

Examples

```
SELECT VERSION(),
 sys.version_major() AS major,
 sys.version_minor() AS minor,
 sys.version_patch() AS patch;
+----------------+-------+-------+-------+
| VERSION()      | major | minor | patch |
+----------------+-------+-------+-------+
| 10.8.2-MariaDB |    10 |     8 |     2 |
+----------------+-------+-------+-------+
```

version_minor

> **Note:**
>
> Sys Schema is available from MariaDB 10.6.

Syntax

```
sys.version_minor()
```

Description

`version_minor` is a stored function available with the Sys Schema.

It returns the MariaDB Server minor release version.

Examples

```
SELECT VERSION(),
 sys.version_major() AS major,
 sys.version_minor() AS minor,
 sys.version_patch() AS patch;
+----------------+-------+-------+-------+
| VERSION()      | major | minor | patch |
+----------------+-------+-------+-------+
| 10.8.2-MariaDB |    10 |     8 |     2 |
+----------------+-------+-------+-------+
```

version_patch

> **Note:**
>
> Sys Schema is available from MariaDB 10.6.

Syntax

```
sys.version_patch()
```

Description

`version_patch` is a stored function available with the Sys Schema.

It returns the MariaDB Server patch release version.

Examples

```
SELECT VERSION(),
 sys.version_major() AS major,
 sys.version_minor() AS minor,
 sys.version_patch() AS patch;
+----------------+-------+-------+-------+
| VERSION()      | major | minor | patch |
+----------------+-------+-------+-------+
| 10.8.2-MariaDB |    10 |     8 |     2 |
+----------------+-------+-------+-------+
```

Sys Schema Stored Procedures

See create_synonym_db.

The create_synonym_db stored procedure creates a new database that contains views mirroring all tables from a source database, useful for creating aliases.

See optimizer_switch Helper Functions.

These helper functions allow you to easily enable or disable specific optimizer_switch flags for the current session.

See ps_trace_statement_digest.

This procedure traces a specific statement digest in the Performance Schema, capturing details about its execution for performance analysis.

See ps_trace_thread.

The ps_trace_thread procedure captures a trace of Performance Schema instrumentation for a specific thread and dumps it to a .dot formatted graph file.

See ps_truncate_all_tables.

This procedure truncates all Performance Schema summary tables, effectively resetting all aggregated performance statistics.

See statement_performance_analyzer.

This diagnostic procedure creates a report of the statements currently running or recently run on the server, aiding in performance troubleshooting.

See table_exists.

The table_exists procedure checks for the existence of a specific table, view, or temporary table within a given database.

This page is licensed: CC BY-SA / Gnu FDL

create_synonym_db

Syntax

```
create_synonym_db(db_name,synonym)

# db_name (VARCHAR(64))
# synonym (VARCHAR(64))
```

Description

`create_synonym_db` is a stored procedure available with the Sys Schema.

Takes a source database name *db_name* and *synonym* name and creates a synonym database with views that point to all of the tables within the source database. Useful for example for creating a synonym for the performance_schema or information_schema databases.

Returns an error if the source database doesn't exist, or the synonym already exists.

Example

```
SHOW DATABASES;
+--------------------+
| Database           |
+--------------------+
| information_schema |
| mysql              |
| performance_schema |
| sys                |
| test               |
+--------------------+

CALL sys.create_synonym_db('performance_schema', 'perf');
+----------------------------------------+
| summary                                |
+----------------------------------------+
| Created 81 views in the `perf` database |
+----------------------------------------+

SHOW DATABASES;
+--------------------+
| Database           |
+--------------------+
| information_schema |
| mysql              |
| perf               |
| performance_schema |
| sys                |
| test               |
+--------------------+

SHOW FULL TABLES FROM perf;
+-----------------------------------------------------+------------+
| Tables_in_perf                                      | Table_type |
+-----------------------------------------------------+------------+
| accounts                                            | VIEW       |
| cond_instances                                      | VIEW       |
| events_stages_current                               | VIEW       |
| events_stages_history                               | VIEW       |
| events_stages_history_long                          | VIEW       |
...
```

optimizer_switch Helper Functions

Syntax

```
optimizer_switch_on()
optimizer_switch_off()
optimizer_switch_choice("on" | "off")
```

Description

The above procedures can be used to check which optimizer_switch options are `on` or `off`. The result set is sorted according to optimizer_switch option name.

Example

```
SELECT @@optimizer_switch\G
*************************** 1. row ***************************
index_merge=on,index_merge_union=on,index_merge_sort_union=on,index_merge_intersection=on,
index_merge_sort_intersection=off,engine_condition_pushdown=off,index_condition_pushdown=on,
derived_merge=on,derived_with_keys=on,firstmatch=on,loosescan=on,materialization=on,
in_to_exists=on,semijoin=on,partial_match_rowid_merge=on,partial_match_table_scan=on,
subquery_cache=on,mrr=off,mrr_cost_based=off,mrr_sort_keys=off,outer_join_with_cache=on,
semijoin_with_cache=on,join_cache_incremental=on,join_cache_hashed=on,join_cache_bka=on,
optimize_join_buffer_size=on,table_elimination=on,extended_keys=on,exists_to_in=on,
orderby_uses_equalities=on,condition_pushdown_for_derived=on,split_materialized=on,
condition_pushdown_for_subquery=on,rowid_filter=on,condition_pushdown_from_having=on,
not_null_range_scan=off

call sys.optimizer_switch_on();
+---------------------------------+------+
| option                          | opt  |
+---------------------------------+------+
| condition_pushdown_for_derived  | on   |
| condition_pushdown_for_subquery | on   |
| condition_pushdown_from_having  | on   |
| derived_merge                   | on   |
| derived_with_keys               | on   |
| exists_to_in                    | on   |
| extended_keys                   | on   |
| firstmatch                      | on   |
| index_condition_pushdown        | on   |
| index_merge                     | on   |
| index_merge_intersection        | on   |
| index_merge_sort_union          | on   |
| index_merge_union               | on   |
| in_to_exists                    | on   |
| join_cache_bka                  | on   |
| join_cache_hashed               | on   |
| join_cache_incremental          | on   |
| loosescan                       | on   |
| materialization                 | on   |
| optimize_join_buffer_size       | on   |
| orderby_uses_equalities         | on   |
| outer_join_with_cache           | on   |
| partial_match_rowid_merge       | on   |
| partial_match_table_scan        | on   |
| rowid_filter                    | on   |
| semijoin                        | on   |
| semijoin_with_cache             | on   |
| split_materialized              | on   |
| subquery_cache                  | on   |
| table_elimination               | on   |
+---------------------------------+------+

call sys.optimizer_switch_off();
+-------------------------------+------+
| option                        | opt  |
+-------------------------------+------+
| engine_condition_pushdown     | off  |
| index_merge_sort_intersection | off  |
| mrr                           | off  |
| mrr_cost_based                | off  |
| mrr_sort_keys                 | off  |
| not_null_range_scan           | off  |
+-------------------------------+------+
```

Notes

`sys.optimizer_switch_on()` is a shortcut for `sys.optimizer_switch_choice("on")` .

`sys.optimizer_switch_off()` is a shortcut for `sys.optimizer_switch_choice("off")` .

ps_trace_statement_digest

Syntax

```
ps_trace_statement_digest(in_digest, in_runtime, in_interval, in_start_fresh, in_auto_enable)
```

Description

`ps_trace_statement_digest` is a stored procedure available with the Sys Schema.

Parameters:

- in_digest `VARCHAR(32)`: The statement digest identifier to analyze.
- in_runtime `INT`: Specifies the duration to run the analysis in seconds.
- in_interval `DECIMAL(2,2)`: The analysis interval measured in seconds (including fraction values), at which snapshots are taken.
- in_start_fresh `BOOLEAN`: Determines whether to truncate the Performance Schema events_statements_history_long and events_stages_history_long tables before starting.
- in_auto_enable `BOOLEAN`: Determines whether to automatically enable required consumers.

Examples

```
CALL sys.ps_trace_statement_digest('891ec6860f98ba46d89dd20b0c03652c', 5, 0.5, TRUE, TRUE);
```

This page is licensed: CC BY-SA / Gnu FDL

ps_trace_thread

Syntax

```
ps_trace_thread(thread_id, outfile, max_runtime, interval, start_fresh, auto_setup, debug)
```

Description

`ps_trace_thread` is a stored procedure available with the Sys Schema.

Parameters:

- thread_id `INT`: The thread to trace.
- outfile `VARCHAR(255)`: Name of the .dot file to be create.
- max_runtime `DECIMAL(20,2)`: Maximum time in seconds to collect data. Fractional seconds can be used, and `NULL` results in data being collected for the default sixty seconds.
- interval `DECIMAL(20,2)`: Time in seconds to sleep between data collection. Fractional seconds can be used, and `NULL` results in the sleep being the default one second.
- start_fresh `BOOLEAN`: Whether to reset all Performance Schema data before tracing.
- auto_setup `BOOLEAN`: Whether to disable all other threads, enable all instruments and consumers, and reset the settings at the end of the run.
- debug `BOOLEAN`: Whether to include `file:lineno` information in the graph.

Dumps all Performance Schema data for an instrumented thread to a .dot formatted graph file (for use with the DOT graph description language). All returned result sets should be used for a complete graph.

Session binary logging is disabled during execution, by adjusting the sql_log_bin session value (note the permissions required).

Examples

```
CALL sys.ps_trace_thread(25, CONCAT('/tmp/stack-', REPLACE(NOW(), ' ', '-'), '.dot'),
  NULL, NULL, TRUE, TRUE, TRUE);

--------------------+
| summary            |

ps_truncate_all_tables

Syntax

```
ps_truncate_all_tables(bool display)
```

Description

`ps_truncate_all_tables` is a stored procedure available with the Sys Schema.

The procedure resets all aggregated instrumentation as a snapshot, producing a result set indicating the number of truncated tables. The boolean parameter *display* specifies whether to display each TRUNCATE TABLE statement before execution.

Examples

```
CALL sys.ps_truncate_all_tables(false);
+---------------------+
| summary             |
+---------------------+
| Truncated 44 tables |
+---------------------+
```

```
CALL sys.ps_truncate_all_tables(true);
+-----------------------------------------------------------------+
| status                                                          |
+-----------------------------------------------------------------+
| Running: TRUNCATE TABLE performance_schema.events_stages_history |
+-----------------------------------------------------------------+

...

+-------------------------------------------------------------------------------+
| status                                                                        |
+-------------------------------------------------------------------------------+
| Running: TRUNCATE TABLE performance_schema.table_lock_waits_summary_by_table |
+-------------------------------------------------------------------------------+

+---------------------+
| summary             |
+---------------------+
| Truncated 44 tables |
+---------------------+
```

This page is licensed: CC BY-SA / Gnu FDL

statement_performance_analyzer

Syntax

```
statement_performance_analyzer(in_action,in_table, in_views)

# in_action ENUM('snapshot', 'overall', 'delta', 'create_tmp',
                 'create_table', 'save', 'cleanup')
# in_table VARCHAR(129)
# in_views SET ('with_runtimes_in_95th_percentile', 'analysis',
                'with_errors_or_warnings', 'with_full_table_scans',
                'with_sorting', 'with_temp_tables', 'custom')
```

Description

`statement_performance_analyzer` is a stored procedure available with the Sys Schema which returns a report on running statements.

The following options from the sys_config table impact the output:

- statement_performance_analyzer.limit - maximum number of rows (default `100`) returned for views that have no built-in limit.
- statement_performance_analyzer.view - custom query/view to be used (default `NULL`). If the statement_performance_analyzer.limit configuration option is greater than 0, there can't be a `LIMIT` clause in the query/view definition.

If the debug option is set (default `OFF`), the procedure will also produce debugging output.

This page is licensed: CC BY-SA / Gnu FDL

table_exists

Syntax

```
table_exists(in_db_name,in_table_name, out_table_type)

# in_db_name VARCHAR(64)
# in_table_name VARCHAR(64)
# out_table_type ENUM('', 'BASE TABLE', 'VIEW', 'TEMPORARY')
```

Description

`table_exists` is a stored procedure available with the Sys Schema.

Given a database *in_db_name* and table name *in_table_name*, returns the table type in the `OUT` parameter *out_table_type*. The return value is an `ENUM` field containing one of:

- '' - the table does not exist
- '`BASE TABLE`' - a regular table
- '`VIEW`' - a view
- '`TEMPORARY`' - a temporary table

Examples

```
CALL sys.table_exists('mysql', 'time_zone', @table_type); SELECT @table_type;
+-------------+
| @table_type |
+-------------+
| BASE TABLE  |
+-------------+

CALL sys.table_exists('mysql', 'user', @table_type); SELECT @table_type;
+-------------+
| @table_type |
+-------------+
| VIEW        |
+-------------+
```

host_summary and x$host_summary Sys Schema Views

> **Note:**
>
> Sys Schema views are available from MariaDB 10.6.

Description

The `host_summary` and `x$host_summary` views contain host activity information, grouped by host. The `host_summary` view is intended to be easier for human reading, while the `x$host_summary` view provides the data in raw form, intended for tools that process the data.

They contain the following columns:

Column	Description
host	Host that the client connected from, or background for background threads (where the HOST column in the underlying Performance Schema table is NULL).
statements	Total number of statements for the host.
statement_latency	Total wait time of timed statements for the host.
statement_avg_latency	Average wait time per timed statement for the host.
table_scans	Total table scans for the host.
file_ios	Total file I/O events for the host.
file_io_latency	Total wait time of timed file I/O events for the host.
current_connections	Current connections for the host.
total_connections	Total connections for the host.
unique_users	Number of distinct users for the host.
current_memory	Current allocated memory for the host.
total_memory_allocated	Total allocated memory for the host.

Example

```
SELECT * FROM sys.host_summary\G
*************************** 1. row ***************************
                    host: localhost
              statements: 59
     statement_latency: 148.11 ms
 statement_avg_latency: 2.51 ms
           table_scans: 11
              file_ios: 2065
       file_io_latency: 79.57 ms
   current_connections: 1
     total_connections: 3
          unique_users: 1
        current_memory: -2672 bytes
total_memory_allocated: 0 bytes

SELECT * FROM sys.x$host_summary\G
*************************** 1. row ***************************
                    host: localhost
              statements: 98
     statement_latency: 160926285000
 statement_avg_latency: 1642104948.9796
           table_scans: 12
              file_ios: 2071
       file_io_latency: 79742533755
   current_connections: 1
     total_connections: 3
          unique_users: 1
        current_memory: -2672
total_memory_allocated: 0
```

This page is licensed: CC BY-SA / Gnu FDL

host_summary_by_file_io and x$host_summary_by_file_io Sys Schema Views

> **Note:**
>
> Sys Schema views are available from MariaDB 10.6.

Description

The `host_summary_by_file_io` and `x$host_summary_by_file_io` views summarize file I/O, grouped by host. Rows are sorted by descending total file I/O latency by default.

The `host_summary_by_file_io` view is intended to be easier for human reading, while the `and` x$host_summary_by_file_io `view provides the data in raw form, intended for tools that process the data.`

They contain the following columns:

Column	Description
host	Host that the client connected from, or background for background threads (where the HOST column in the underlying Performance Schema table is NULL).
ios	Total file I/O events for the host.
ios_latency	Total wait time of timed file I/O events for the host.

Example

```
SELECT * FROM sys.host_summary_by_file_io\G
*************************** 1. row ***************************
      host: localhost
       ios: 6526
io_latency: 490.28 ms
*************************** 2. row ***************************
      host: background
       ios: 457
io_latency: 151.39 ms

SELECT * FROM sys.x$host_summary_by_file_io\G
*************************** 1. row ***************************
      host: localhost
       ios: 6532
io_latency: 490447878974
*************************** 2. row ***************************
      host: background

host_summary_by_file_io_type and x$host_summary_by_file_io_type Sys Schema Views

> **Note:**
>
> Sys Schema views are available from MariaDB 10.6.

Description

The `host_summary_by_file_io_type` and `x$host_summary_by_file_io_type` views summarize file I/O, grouped by host and event type. Rows are sorted by host and descending total I/O latency by default. The `host_summary_by_file_io_type` view is intended to be easier for human reading, while the `x$host_summary_by_file_io_type` view provides the data in raw form, intended for tools that process the data.

They contain the following columns:

Column	Description
host	Host that the client connected from, or background for background threads (where the HOST column in the underlying Performance Schema table is NULL).
event_name	File I/O event name.
total	Total number of occurrences of the file I/O event for the host.
total_latency	Total wait time of timed occurrences of the file I/O event for the host.
max_latency	Maximum single wait time of timed occurrences of the file I/O event for the host.

Example

```
SELECT * FROM sys.host_summary_by_file_io_type;
+------------+-------------------------------------------+-------+---------------+-------------+
| host       | event_name                                | total | total_latency | max_latency |
+------------+-------------------------------------------+-------+---------------+-------------+
| background | wait/io/file/innodb/innodb_log_file       |    45 | 109.80 ms     | 26.48 ms    |
| background | wait/io/file/innodb/innodb_data_file      |   195 | 29.47 ms      | 1.23 ms     |
| background | wait/io/file/sql/global_ddl_log           |     4 | 4.45 ms       | 4.33 ms     |
...
| localhost  | wait/io/file/csv/data                     |     4 | 25.98 us      | 9.60 us     |
| localhost  | wait/io/file/partition/ha_partition::parfile |     1 | 14.19 us      | 14.19 us    |
| localhost  | wait/io/file/myisam/kfile                 |     1 | 11.95 us      | 11.95 us    |
+------------+-------------------------------------------+-------+---------------+-------------+

SELECT * FROM sys.x$host_summary_by_file_io_type;
+------------+-------------------------------------------+-------+---------------+-------------+
| host       | event_name                                | total | total_latency | max_latency |
+------------+-------------------------------------------+-------+---------------+-------------+
| background | wait/io/file/innodb/innodb_log_file       |    45 |  109804643160 | 26478157582 |
| background | wait/io/file/innodb/innodb_data_file      |   195 |   29469738630 |  1226986584 |
| background | wait/io/file/sql/global_ddl_log           |     4 |    4447263252 |  4327780456 |
| localhost  | wait/io/file/csv/data                     |     4 |      25978718 |     9603922 |
| localhost  | wait/io/file/partition/ha_partition::parfile |     1 |      14191190 |    14191190 |
| localhost  | wait/io/file/myisam/kfile                 |     1 |      11954300 |    11954300 |

host_summary_by_stages and x$host_summary_by_stages Sys Schema Views

> **Note:**
>
> Sys Schema views are available from MariaDB 10.6.

Description

The `host_summary_by_stages` and `x$host_summary_by_stages` views summarize statement stages, grouped by host. Rows are sorted by host and descending total latency by default. The `host_summary_by_stages` view is intended to be easier for human reading, while the `x$host_summary_by_stages` view provides the data in raw form, intended for tools that process the data.

They contain the following columns:

Column	Description
host	Host that the client connected from, or background for background threads (where the HOST column in the underlying Performance Schema table is NULL).
event_name	Stage event name.
total	Total number of occurrences of the file stage event for the host.
total_latency	Total wait time of timed occurrences of the stage event for the host.
avg_latency	Average wait time per timed occurrence of the stage event for the host.

Example

```
SELECT * FROM sys.host_summary_by_stages\G
*************************** 1. row ***************************
         host: background
   event_name: stage/innodb/buffer pool load
        total: 1
total_latency: 3.75 ms
  avg_latency: 3.75 ms

SELECT * FROM sys.x$host_summary_by_stages\G
*************************** 1. row ***************************
         host: background
   event_name: stage/innodb/buffer pool load
        total: 1
total_latency: 3747098000
  avg_latency: 3747098000
```

host_summary_by_statement_type and x$host_summary_by_statement_type Sys Schema Views

> **Note:**
>
> Sys Schema views are available from MariaDB 10.6.

Description

The `host_summary_by_statement_type` and `x$host_summary_by_statement_type` views summarize information about executed statements, grouped by host and statement type. Rows are sorted by host and descending total latency by default.

The `host_summary_by_statement_type` view is intended to be easier for human reading, while the `x$host_summary_by_statement_type` view provides the data in raw form, intended for tools that process the data.

They contain the following columns:

Column	Description
host	Host that the client connected from, or background for background threads (where the HOST column in the underlying Performance Schema table is NULL).
statement	Final component of the statement event name, for example create_table or select.
total	Total number of statement occurrences for the host.
total_latency	Total wait time of timed statements of the statement event for the host.
max_latency	Maximum single wait time of timed occurrences of the statement event for the host.
lock_latency	Total time spent by timed occurrences of the statement event for the host waiting for locks.
rows_sent	Total number of rows returned by occurrences of the statement event for the host.
rows_examined	Total number of rows read from storage engines by occurrences of the statement event for the host.
rows_affected	Total number of rows affected by occurrences of the statement event for the host.
full_scans	Total number of full table scans by occurrences of the statement event for the host.

Example

```
SELECT * FROM sys.host_summary_by_statement_type\G
*************************** 1. row ***************************
         host: localhost
    statement: create_table
        total: 18
total_latency: 366.93 ms
  max_latency: 48.02 ms
 lock_latency: 3.16 ms
    rows_sent: 0
rows_examined: 0
rows_affected: 0
   full_scans: 0
*************************** 2. row ***************************
         host: localhost
    statement: select
        total: 27
total_latency: 339.16 ms
  max_latency: 64.51 ms
 lock_latency: 205.61 ms
    rows_sent: 750599937895926
rows_examined: 13925
rows_affected: 0
   full_scans: 21

...

SELECT * FROM sys.x$host_summary_by_statement_type\G
*************************** 1. row ***************************
         host: localhost
    statement: create_table
        total: 18
total_latency: 366927804000
  max_latency: 48023563000
 lock_latency: 3156000000
    rows_sent: 0
rows_examined: 0
rows_affected: 0
   full_scans: 0
*************************** 2. row ***************************
         host: localhost
    statement: select
        total: 28
total_latency: 343873182000

host_summary_by_statement_latency and x$host_summary_by_statement_latency Sys Schema Views

> **Note:**
>
> Sys Schema views are available from MariaDB 10.6.

Description

The `host_summary_by_statement_latency` and `x$host_summary_by_statement_latency` views summarize statement statistics, grouped by host. Rows are sorted by descending total latency by default. The `host_summary_by_statement_latency` view is intended to be easier for human reading, while the

`x$host_summary_by_statement_latency` view provides the data in raw form, intended for tools that process the data.

They contain the following columns:

Column	Description
host	Host that the client connected from, or background for background threads (where the HOST column in the underlying Performance Schema table is NULL).
total	Total number of statements for the host.
max_latency	Maximum single wait time of timed statements for the host.
lock_latency	Total time spent by timed statements for the host waiting for locks.
total_latency	Total wait time of timed statements for the host.
rows_sent	Total number of rows returned by statements for the host.
rows_examined	Total number of rows read from storage engines by statements for the host.
rows_affected	Total number of rows affected by statements for the host.
full_scans	Total number of full table scans by statements for the host.

Example

```
SELECT * FROM sys.host_summary_by_statement_latency\G
*************************** 1. row ***************************
         host: localhost
        total: 1042
total_latency: 816.89 ms
  max_latency: 64.51 ms
 lock_latency: 215.64 ms
    rows_sent: 750599937895985
rows_examined: 13548
rows_affected: 6
   full_scans: 33
*************************** 2. row ***************************

innodb_buffer_stats_by_schema and x$innodb_buffer_stats_by_schema Sys Schema Views

> **Note:**
>
> Sys Schema views are available from MariaDB 10.6.

Querying these views can have a noticeable performance impact on a production server.

Description

The `innodb_buffer_stats_by_schema` and `x$innodb_buffer_stats_by_schema` views summarize information from the Information Schema INNODB_BUFFER_PAGE table, grouped by schema. Rows are sorted by descending buffer size by default.

The `innodb_buffer_stats_by_schema` view is intended to be easier for human reading, while the `x$innodb_buffer_stats_by_schema` view provides the data in raw form, intended for tools that process the data.

They contain the following columns:

Column	Description
object_schema	Object schema name, or InnoDB System if the table belongs to the InnoDB storage engine.
allocated	Total number of bytes allocated for the schema.
data	Total number of data bytes allocated for the schema.
pages	Total number of pages allocated for the schema.
pages_hashed	Total number of hashed pages allocated for the schema.
pages_old	Total number of old pages allocated for the schema.
rows_cached	Total number of cached rows for the schema.

Example

```
SELECT * FROM sys.innodb_buffer_stats_by_schema\G
*************************** 1. row ***************************
object_schema: InnoDB System
    allocated: 160.00 KiB
         data: 6.21 KiB
        pages: 10
 pages_hashed: 10
    pages_old: 10
  rows_cached: 21
*************************** 2. row ***************************
object_schema: mysql
    allocated: 112.00 KiB
         data: 1.73 KiB
        pages: 7

innodb_buffer_stats_by_table and x$innodb_buffer_stats_by_table Sys Schema Views

> **Note:**
>
> Sys Schema views are available from MariaDB 10.6.

Querying these views can have a noticeable performance impact on a production server.

Description

The `innodb_buffer_stats_by_table` and `x$innodb_buffer_stats_by_table` views summarize information from the Information Schema INNODB_BUFFER_PAGE table, grouped by schema and table. Rows are sorted by descending buffer size by default.

The `innodb_buffer_stats_by_table` view is intended to be easier for human reading, while the `x$innodb_buffer_stats_by_table` view provides the data in raw form, intended for tools that process the data.

They contain the following columns:

Column	Description
object_schema	Object schema name, or InnoDB System if the table belongs to the InnoDB storage engine.
object_name	Table name.
allocated	Total number of bytes allocated for the table.
data	Number of data bytes allocated for the table.
pages	Total number of pages allocated for the table.
pages_hashed	Total number of hashed pages allocated for the table.
pages_old	Total number of old pages allocated for the table.
rows_cached	Total number of cached rows for the table.

Example

```
SELECT * FROM sys.innodb_buffer_stats_by_table\G
*************************** 1. row ***************************
object_schema: mysql
  object_name: transaction_registry
    allocated: 64.00 KiB

innodb_lock_waits and x$innodb_lock_waits Sys Schema Views

> **Note:**
>
> Sys Schema views are available from MariaDB 10.6.

Description

The `innodb_lock_waits` and `x$innodb_lock_waits` views summarize InnoDB locks that transactions are waiting upon, by default sorted in descending buffer size.

The `innodb_lock_waits` view is intended to be easier for human reading, while the `x$innodb_lock_waits` view provides the data in raw form, intended for tools that process the data.

They contain the following columns:

Column	Description
wait_started	Time that lock wait began.
wait_age	TIME value for the length of the lock wait.
wait_age_secs	Seconds value for the length of the lock wait.
locked_table_schema	Schema containing the locked table.
locked_table_name	Name of the locked table.
locked_table_partition	Name of the locked partition, or NULL if none.
locked_table_subpartition	Name of the locked subpartition, or NULL if none.
locked_index	Name of the locked index.
locked_type	Type of the waiting lock.
waiting_trx_id	ID of the waiting transaction.
waiting_trx_started	Time that the waiting transaction started.
waiting_trx_age	TIME value for the length of time that the transaction has been waiting.
waiting_trx_rows_locked	Number of rows locked by the waiting transaction.
waiting_trx_rows_modified	Number of rows modified by the waiting transaction.
waiting_pid	Processlist ID of the waiting transaction.
waiting_query	Statement waiting for the lock.
waiting_lock_id	ID of the waiting lock.
waiting_lock_mode	Mode of the waiting lock.
blocking_trx_id	ID of the transaction blocking the waiting lock.
blocking_pid	Processlist ID of the blocking transaction.
blocking_query	Statement the blocking transaction is executing, or NULL if the session that issued the blocking query has become idle.
blocking_lock_id	ID of the lock blocking the waiting lock.
blocking_lock_mode	Mode of the lock blocking the waiting lock.
blocking_trx_started	Time the blocking transaction started.
blocking_trx_age	TIME value for how long the blocking transaction has been executing.
blocking_trx_rows_locked	Number of rows locked by the blocking transaction.
blocking_trx_rows_modified	Number of rows modified by the blocking transaction.
sql_kill_blocking_query	KILL statement that could be used to kill the blocking statement.

Column	Description
sql_kill_blocking_connection	KILL statement that could be used to kill the blocking statement session.

io_by_thread_by_latency and x$io_by_thread_by_latency Sys Schema Views

> **Note:**
>
> Sys Schema views are available from MariaDB 10.6.

Description

The `io_by_thread_by_latency` and `x$io_by_thread_by_latency` view summarize I/O consumers to display time waiting for I/O, grouped by thread. Rows are sorted by descending total I/O latency by default.

The `io_by_thread_by_latency` view is intended to be easier for human reading, while the `x$io_by_thread_by_latency` view provides the data in raw form, intended for tools that process the data.

They contain the following columns:

Column	Description
user	The account associated with a foreground thread, or the background thread name
total	Total number of I/O events allocated for the thread.
total_latency	Total wait time of timed I/O events for the thread.
min_latency	Minimum single wait time of timed I/O events for the thread.
avg_latency	Average wait time per timed I/O event for the thread.
min_latency	Maximum single wait time of timed I/O events for the thread.
thread_id	Thread id.
processlist_id	Processlist id for foreground threads, or NULL for background threads.

Example

```
SELECT * FROM sys.io_by_thread_by_latency\G
*************************** 1. row ***************************
          user: main
         total: 378
 total_latency: 40.11 ms
   min_latency: 570.21 ns
   avg_latency: 206.02 us
   max_latency: 4.33 ms
     thread_id: 1
processlist_id: NULL
*************************** 2. row ***************************
          user: msandbox@localhost
         total: 521
 total_latency: 10.28 ms
   min_latency: 775.04 ns
   avg_latency: 21.79 us
   max_latency: 977.79 us
     thread_id: 89
processlist_id: 7

...

SELECT * FROM sys.x$io_by_thread_by_latency\G
*************************** 1. row ***************************
          user: main
         total: 378

io_global_by_file_by_bytes and x$io_global_by_file_by_bytes Sys Schema Views

> **Note:**
>
> Sys Schema views are available from MariaDB 10.6.

Description

The `io_global_by_file_by_bytes` and `x$io_global_by_file_by_bytes` views summarize global I/O consumers showing I/O in bytes, grouped by file. Rows are sorted by descending total I/O (bytes read and written) by default.

The `io_global_by_file_by_bytes` view is intended to be easier for human reading, while the `x$io_global_by_file_by_bytes` view provides the data in raw form, intended for tools that process the data.

They contain the following columns:

Column	Description
file	File path name.
count_read	Total number of read events for the file.
total_read	Total number of bytes read from the file.
avg_read	Average number of bytes per read from the file.
count_write	Total number of write events for the file.
total_written	Total number of bytes written to the file.
avg_write	Average number of bytes per write to the file.
total	Total number of bytes read and written for the file.
write_pct	Percentage of total I/O bytes that were writes.

Example

```
SELECT * FROM sys.io_global_by_file_by_bytes\G
...
*************************** 3. row ***************************
         file: @@datadir/ddl_recovery.log
   count_read: 0
   total_read: 0 bytes
     avg_read: 0 bytes
  count_write: 114
total_written: 220.17 KiB
    avg_write: 1.93 KiB
        total: 220.17 KiB
    write_pct: 100.00
*************************** 4. row ***************************
         file: @@datadir/ib_logfile0
   count_read: 6
   total_read: 66.50 KiB
     avg_read: 11.08 KiB
  count_write: 43
total_written: 81.00 KiB
    avg_write: 1.88 KiB
        total: 147.50 KiB
    write_pct: 54.92
...

SELECT * FROM sys.x$io_global_by_file_by_bytes\G
...
*************************** 3. row ***************************
         file: /home/ian/sandboxes/msb_10_6_19/data/ddl_recovery.log

io_global_by_file_by_latency and x$io_global_by_file_by_latency Sys Schema Views

> **Note:**
>
> Sys Schema views are available from MariaDB 10.6.

Description

The `io_global_by_file_by_latency` and `x$io_global_by_file_by_latency` views summarize global I/O consumers to display time waiting for I/O, grouped by file. Rows are sorted by descending total latency by default.

The `io_global_by_file_by_latency` view is intended to be easier for human reading, while the `x$io_global_by_file_by_latency` view provides the data in raw form, intended for tools that process the data.

They contain the following columns:

Column	Description
file	File path name.
total	Total number of I/O events for the file.
total_latency	Total wait time of timed I/O events for the file.
count_read	Total number of read I/O events for the file.
read_latency	Total wait time of timed read I/O events for the file.
count_write	Total number of write I/O events for the file.
write_latency	Total wait time of timed write I/O events for the file.
count_misc	Total number of other I/O events for the file.
misc_latency	Total wait time of timed other I/O events for the file.

Example

```
SELECT * FROM sys.io_global_by_file_by_latency\G
*************************** 1. row ***************************
         file: @@datadir/ddl_recovery.log
        total: 222
total_latency: 288.64 ms
   count_read: 0
 read_latency: 0 ps
  count_write: 114
write_latency: 2.59 ms
   count_misc: 108
 misc_latency: 286.05 ms
*************************** 2. row ***************************
         file: @@datadir/ib_logfile0
        total: 95
total_latency: 165.29 ms

io_global_by_wait_by_bytes and x$io_global_by_wait_by_bytes Sys Schema Views

> **Note:**
>
> Sys Schema views are available from MariaDB 10.6.

Description

The `io_global_by_wait_by_bytes` and `x$io_global_by_wait_by_bytes` views summarize global I/O consumers, displaying amount of I/O and time waiting for I/O, grouped by event. Rows are sorted by descending total I/O (bytes read and written) by default.

The `io_global_by_wait_by_bytes` view is intended to be easier for human reading, while the `x$io_global_by_wait_by_bytes` view provides the data in raw form, intended for tools that process the data.

They contain the following columns:

Column	Description
event_name	I/O event name. The wait/io/file prefix is stripped.
total	Total number of occurrences of the I/O event.
total_latency	Total wait time of timed occurrences of the I/O event
min_latency	Minimum single wait time of timed occurrences of the I/O event.
avg_latency	Average wait time per timed occurrence of the I/O event.
max_latency	Maximum single wait time of timed occurrences of the I/O event.
count_read	Total number of read I/O events for the file.
total_read	Total number of bytes read for the I/O event.
avg_read	Average number of bytes per read for the I/O event.
count_write	Total number of write requests for the I/O event.
total_written	Number of bytes written for the I/O event.
avg_written	Average number of bytes per write for the I/O event.
total_requested	Total number of bytes (read and write) for the I/O event.

Example

```
SELECT * FROM sys.io_global_by_wait_by_bytes\G
*************************** 1. row ***************************
     event_name: innodb/innodb_data_file
          total: 220

latest_file_io and x$latest_file_io Sys Schema Views

> **Note:**
>
> Sys Schema views are available from MariaDB 10.6.

Description

The `latest_file_io` and `x$latest_file_io` views summarize file I/O activity, grouped by file and thread. Rows are sorted by most recent I/O by default.

The `latest_file_io` view is intended to be easier for human reading, while the `x$latest_file_io` view provides the data in raw form, intended for tools that process the data.

They contain the following columns:

Column	Description
thread	Account associated with the thread for foreground threads (port number for TCP/IP connections), or thread name and thread ID for background threads.
total	Total number of occurrences of the I/O event.
file	File path name.
latency	Wait time of the file I/O event.
operation	Type of operation
requested	Number of bytes requested for the file I/O event.

This page is licensed: CC BY-SA / Gnu FDL

memory_by_host_by_current_bytes and x$memory_by_host_by_current_bytes Views

> **Note:**
>
> Sys Schema views are available from MariaDB 10.6.

Description

The `memory_by_host_by_current_bytes` and `x$memory_by_host_by_current_bytes` summarize memory use grouped by host. Rows by default are sorted by descending amount of memory used.

The `memory_by_host_by_current_bytes` view is intended to be easier for human reading, while the `x$memory_by_host_by_current_bytes` view provides the data in raw form, intended for tools that process the data.

They contain the following columns:

Column	Description
host	Host from which the client connected. If the HOST column in the underlying Performance Schema table is NULL, rows are assumed to be for background threads, and the background host name is used.
current_count_used	Current number of allocated memory blocks that have not yet been freed for the host.
current_allocated	Current number of allocated bytes that have not yet been freed for the host.

Column	Description
current_avg_alloc	Current number of allocated bytes per memory block for the host.
current_max_alloc	Largest single current memory allocation in bytes for the host.
total_allocated	Total memory allocation in bytes for the host.

This page is licensed: CC BY-SA / Gnu FDL

metrics Sys Schema View

> **Note:**
>
> Sys Schema views are available from MariaDB 10.6.

Description

The `metrics` view contains global status variables (as found in the Performance Schema global_status Table), InnoDB metrics (as found in the Information Schema INNODB_METRICS Table, current and total memory allocation, based on the Performance Schema memory instrumentation, as well the current time in human readable and Unix timestamp formats.

It contains the following columns:

Column	Description
Variable_name	The name of the metric. One of the VARIABLE_NAME column if a global_status table, the NAME column if an InnoDB metric, or a description for other metrics.
Variable_value	The metric value. One of the VARIABLE_VALUE column if a global status variable, the COUNT column for InnoDB metrics, the related column from the Performance Schema memory_summary_global_by_event_name table, the value of NOW(3) or UNIX_TIMESTAMP(NOW(3)).
Type	Metric type. One of Global Status, InnoDB Metrics - % (with % being the value of the SUBSYSTEM column in the INNODB_METRICS table, Performance Schema or System Time
Enabled	Whether the metric is enabled. Always YES for global status variables and the current time. For InnoDB metrics, YES only if the STATUS column of the INNODB_METRICS table, otherwise NO. For memory metrics: YES, NO or PARTIAL (for metrics where not all memory/% instruments are enabled). Performance Schema memory instruments are always enabled)

Example

```
SELECT * FROM sys.metrics\G
*************************** 1. row ***************************
 Variable_name: aborted_clients
Variable_value: 0
          Type: Global Status
       Enabled: YES
*************************** 2. row ***************************
 Variable_name: aborted_connects
Variable_value: 0
          Type: Global Status
       Enabled: YES

...

*************************** 578. row ***************************
 Variable_name: trx_undo_slots_used
Variable_value: 0
          Type: InnoDB Metrics - transaction
       Enabled: YES
*************************** 579. row ***************************
 Variable_name: NOW()
Variable_value: 2024-09-09 16:16:08.745
          Type: System Time
       Enabled: YES
*************************** 580. row ***************************
 Variable_name: UNIX_TIMESTAMP()
Variable_value: 1725891368.745
          Type: System Time
       Enabled: YES
```

privileges_by_table_by_level Sys Schema View

> **Note:**
>
> Sys Schema views are available from MariaDB 10.6.

> **Note:**
>
> This view is available from MariaDB 11.4.

Description

Shows granted privileges broken down by table on which they allow access and level on which they were granted.

For example, if a user `x` has `SELECT` privilege granted `ON db.*`, this view will list all tables in the `db` schema with the user `x` having `SELECT` privilege on them. This is different from INFORMATION_SCHEMA.TABLE_PRIVILEGES, which only lists privileges granted on the table level.

Column	Description
TABLE_SCHEMA	Database name.
TABLE_NAME	Table name.
GRANTEE	Account name that was granted the privilege.
PRIVILEGE	Privilege, such as SELECT or DROP.
LEVEL	Privilege level, such as GLOBAL or SCHEMA.

Example

```
SELECT * FROM sys.privileges_by_table_by_level;
+--------------+------------+--------------------------+----------------+--------+
| TABLE_SCHEMA | TABLE_NAME | GRANTEE                  | PRIVILEGE      | LEVEL  |
+--------------+------------+--------------------------+----------------+--------+
...
| test         | t2         | 'root'@'localhost'       | SELECT         | GLOBAL |
| test         | t1         | 'root'@'localhost'       | SELECT         | GLOBAL |
| test         | t3         | 'root'@'localhost'       | SELECT         | GLOBAL |
| test         | t2         | 'root'@'localhost'       | INSERT         | GLOBAL |
| test         | t1         | 'root'@'localhost'       | INSERT         | GLOBAL |
| test         | t3         | 'root'@'localhost'       | INSERT         | GLOBAL |
| test         | t2         | 'root'@'localhost'       | UPDATE         | GLOBAL |
| test         | t1         | 'root'@'localhost'       | UPDATE         | GLOBAL |
| test         | t3         | 'root'@'localhost'       | UPDATE         | GLOBAL |
| test         | t2         | 'root'@'localhost'       | DELETE         | GLOBAL |
| test         | t1         | 'root'@'localhost'       | DELETE         | GLOBAL |
| test         | t3         | 'root'@'localhost'       | DELETE         | GLOBAL |
| test         | t2         | 'root'@'localhost'       | CREATE         | GLOBAL |
| test         | t1         | 'root'@'localhost'       | CREATE         | GLOBAL |

schema_auto_increment_columns Sys Schema View

> **Note:**
>
> Sys Schema views are available from MariaDB 10.6.

Description

Information about AUTO_INCREMENT columns, sorted by descending usage ratio and maximum column value. Does not include columns in the `mysql`, `sys`, `information_schema` and `performance_schema` schemas.

Contains the following columns:

Column	Description
table_schema	Schema name containing the table with the auto_increment attribute.
table_name	Table containing the auto_increment attribute.
column_name	Name of the column containing the auto_increment attribute.
data_type	Data type of the auto_increment column, for example tinyint.
column_type	Data type of the auto_increment column, plus additional information for example tinyint(3) unsigned.
is_signed	1 if the column is signed,0 if not.
is_unsigned	1 if the column is unsigned,0 if it is.
max_value	Maximum possible value for the column, for example 255 for an unsigned tinyint.
auto_increment	Current auto_increment value for the column.
auto_increment_ratio	Ratio of used to maximum value for the auto_increment column.

Example

```
CREATE OR REPLACE TABLE animals (
    id TINYINT NOT NULL AUTO_INCREMENT,
    name CHAR(30) NOT NULL,
    PRIMARY KEY (id)
);

 INSERT INTO animals (name) VALUES
    ('dog'),('cat'),('penguin'),
    ('fox'),('whale'),('ostrich');

SELECT * FROM sys.schema_auto_increment_columns\G
*************************** 1. row ***************************
        table_schema: test
          table_name: animals
         column_name: id
           data_type: tinyint
         column_type: tinyint(4)
           is_signed: 1
         is_unsigned: 0
           max_value: 127
      auto_increment: 7
auto_increment_ratio: 0.0551
```

schema_object_overview Sys Schema View

> **Note:**
>
> Sys Schema views are available from MariaDB 10.6.

Description

A count of the number of objects within each schema, sorted by schema and object.

Contains the following columns:

Column	Description
db	Schema name
object_type	Object name
count	Count of the number of objects

Example

```
SELECT * FROM sys.schema_object_overview;
+--------------------+---------------+-------+
| db                 | object_type   | count |
+--------------------+---------------+-------+
| information_schema | SYSTEM VIEW   |    79 |
| mysql              | BASE TABLE    |    30 |
| mysql              | INDEX (BTREE) |    76 |
| mysql              | PROCEDURE     |     2 |
| mysql              | VIEW          |     1 |
| performance_schema | BASE TABLE    |    81 |
| sys                | BASE TABLE    |     1 |
| sys                | FUNCTION      |    22 |
| sys                | INDEX (BTREE) |     1 |
| sys                | PROCEDURE     |    26 |
| sys                | VIEW          |   100 |
+--------------------+---------------+-------+
```

The mysql Database Tables

See mysql.column_stats Table.

The mysql.column_stats table stores engine-independent column statistics, such as histograms, used by the optimizer to improve query execution plans.

See mysql.columns_priv Table.

The mysql.columns_priv table records column-level privileges granted to users, detailing specific access rights for individual columns.

See mysql.db Table.

The mysql.db table stores database-level privileges, determining which users have access to specific databases and what actions they can perform.

See mysql.event Table.

The mysql.event table contains the definitions and scheduling information for events created with the CREATE EVENT statement.

See mysql.func Table.

The mysql.func table registers user-defined functions (UDFs), storing their names and the shared library files containing their code.

See mysql.general_log Table.

The mysql.general_log table captures a record of all SQL statements received by the server when general query logging is enabled and written to tables.

See mysql.global_priv Table.

The mysql.global_priv table stores global privileges and account properties for all users, replacing the older mysql.user table structure.

See mysql.gtid_slave_pos Table.

The mysql.gtid_slave_pos table tracks the Global Transaction ID (GTID) of the last applied transaction on a replica to ensure replication consistency.

See mysql.help_category Table.

The mysql.help_category table stores category information for the server-side help system, organizing help topics into a hierarchy.

See mysql.help_keyword Table.

The mysql.help_keyword table maps keywords to help topics, facilitating keyword-based searches within the MariaDB help system.

See mysql.help_relation Table.

The mysql.help_relation table links help keywords to help topics, defining the structure of the server-side help system.

See mysql.help_topic Table.

The mysql.help_topic table stores the detailed content of help topics, including descriptions and examples displayed by the HELP command.

See mysql.index_stats Table.

The mysql.index_stats table stores engine-independent index statistics, such as cardinality, used by the optimizer to plan query execution.

See mysql.innodb_index_stats.

The mysql.innodb_index_stats table stores persistent index statistics for InnoDB, allowing optimizer plans to remain stable across restarts.

See mysql.innodb_table_stats.

The mysql.innodb_table_stats table holds persistent table-level statistics for InnoDB, such as row counts, used for query optimization.

See mysql.password_reuse_check_history Table.

This table stores a history of password hashes to enforce security policies regarding password reuse when the relevant plugin is enabled.

See mysql.plugin Table.

The mysql.plugin table records information about installed server plugins, ensuring they are reloaded automatically upon server startup.

See mysql.proc Table.

The mysql.proc table stores the definitions, body, and metadata for stored procedures and functions created on the server.

See mysql.procs_priv Table.

The mysql.procs_priv table records privileges granted to users specifically for executing or altering stored procedures and functions.

See mysql.proxies_priv Table.

The mysql.proxies_priv table manages proxy user privileges, defining which accounts are authorized to proxy as other users.

See mysql.roles_mapping Table.

The mysql.roles_mapping table manages role assignments, linking user accounts to the roles they have been granted.

See mysql.servers Table.

The mysql.servers table stores connection information for remote servers, used by the FEDERATED and Spider storage engines.

See mysql.slow_log Table.

The mysql.slow_log table records details of queries that exceed the long_query_time threshold when slow query logging to tables is enabled.

See mysql.table_stats Table.

The mysql.table_stats table stores engine-independent statistics about tables, such as row counts, to assist the optimizer.

See mysql.tables_priv Table.

The mysql.tables_priv table records table-level privileges granted to users, specifying which actions they can perform on specific tables.

See mysql.time_zone Table.

The mysql.time_zone table assigns a unique ID to each time zone supported by the server, linking to other time zone system tables.

See mysql.time_zone_leap_second Table.

The mysql.time_zone_leap_second table lists leap second corrections to be applied to specific time zones.

See mysql.time_zone_name Table.

The mysql.time_zone_name table maps human-readable time zone names (e.g., “Europe/Berlin”) to their internal time zone IDs.

See mysql.time_zone_transition Table.

The mysql.time_zone_transition table defines the exact times at which daylight saving time or other time zone transitions occur.

See mysql.time_zone_transition_type Table.

The mysql.time_zone_transition_type table describes the properties of time zone transitions, such as the offset and abbreviation.

See mysql.transaction_registry Table.

The mysql.transaction_registry table is used by system-versioned tables to track transaction IDs and their commit timestamps.

See mysql.user Table.

Complete mysql.user table reference: mysql.global_priv view, Host/User identifiers, plugin/authentication_string fields, and GRANT/CREATE USER integration.

See Spider mysql Database Tables.

Explore Spider-related tables within the mysql database. These system tables store crucial configuration and metadata for the Spider storage engine, essential for distributed deployments.

This page is licensed: CC BY-SA / Gnu FDL

mysql.column_stats Table

The `mysql.column_stats` table is one of three tables storing data used for Engine-independent table statistics. The others are mysql.table_stats and mysql.index_stats.

It is populated when the ANALYZE TABLE statement is run, although not by default. See Collecting Statistics with the ANALYZE TABLE Statement for details.

Note that statistics for blob and text columns are not collected. If explicitly specified, a warning is returned.

It is possible to manually update the table and, unlike most system tables, there are some scenarios where this could be useful. See Manual updates to statistics tables for details.

This table uses the Aria storage engine.

The `mysql.column_stats` table contains the following fields:

Field	Type	Null	Key	Default	Description
db_name	varchar(64)	NO	PRI	NULL	Database the table is in.
table_name	varchar(64)	NO	PRI	NULL	Table name.
column_name	varchar(64)	NO	PRI	NULL	Name of the column.
min_value	varbinary(255)	YES		NULL	
max_value	varbinary(255)	YES		NULL	
nulls_ratio	decimal(12,4)	YES		NULL	Fraction of NULL values (0- no NULLs, 0.5 - half values are NULLs, 1 - all values are NULLs).
avg_length	decimal(12,4)	YES		NULL	Average length of column value, in bytes. Counted as if one ran SELECT AVG(LENGTH(col)). This doesn't count NULL bytes, assumes endspace removal for CHAR(n), etc.
avg_frequency	decimal(12,4)	YES		NULL	Average number of records with the same value
hist_size	tinyint(3) unsigned	YES		NULL	Histogram size in bytes, from 0-255, or, from MariaDB 10.8, number of buckets if the histogram type is JSON_HB.
hist_type	enum('SINGLE_PREC_HB', 'DOUBLE_PREC_HB') (from MariaDB 10.8) enum('SINGLE_PREC_HB', 'DOUBLE_PREC_HB','JSON_HB') (until MariaDB 10.7)	YES		NULL	Histogram type. See the histogram_type system variable.
histogram	blob (from MariaDB 10.7) varbinary(255) (until MariaDB 10.7)	YES		NULL	

This page is licensed: CC BY-SA / Gnu FDL

mysql.columns_priv Table

The `mysql.columns_priv` table contains information about column-level privileges. The table can be queried and although it is possible to directly update it, it is best to use GRANT for setting privileges.

Note that the MariaDB privileges occur at many levels. A user may be granted a privilege at the column level, but may still not have permission on a table level, for example. See privileges for a more complete view of the MariaDB privilege system.

The INFORMATION_SCHEMA.COLUMN_PRIVILEGES table derives its contents from `mysql.columns_priv`.

This table uses the Aria storage engine.

The `mysql.columns_priv` table contains the following fields:

Field	Type	Null	Key	Default	Description
Host	char(60)	NO	PRI		Host (together with User, Db , Table_name andColumn_name makes up the unique identifier for this record.
Db	char(64)	NO	PRI		Database name (together with User, Host , Table_name andColumn_name makes up the unique identifier for this record.
User	char(80)	NO	PRI		User (together with Host, Db , Table_name andColumn_name makes up the unique identifier for this record.
Table_name	char(64)	NO	PRI		Table name (together with User, Db , Host andColumn_name makes up the unique identifier for this record.
Column_name	char(64)	NO	PRI		Column name (together with User, Db , Table_name andHost makes up the unique identifier for this record.
Timestamp	timestamp	NO		CURRENT_TIMESTAMP	
Column_priv	set('Select', 'Insert', 'Update', 'References')	NO			The privilege type. See Column Privileges for details.

The Acl_column_grants status variable indicates how many rows the `mysql.columns_priv` table contains.

This page is licensed: CC BY-SA / Gnu FDL

mysql.db Table

The `mysql.db` table contains information about database-level privileges. The table can be queried and although it is possible to directly update it, it is best to use GRANT for setting privileges.

Note that the MariaDB privileges occur at many levels. A user may not be granted a privilege at the database level, but may still have permission on a table level, for example. See privileges for a more complete view of the MariaDB privilege system.

This table uses the Aria storage engine.

The `mysql.db` table contains the following fields:

Field	Type	Null	Key	Default	Description
Host	char(60)	NO	PRI		Host (together with User and Db makes up the unique identifier for this record. Until MariaDB 5.5, if the host field was blank, the corresponding record in the mysql.host table would be examined. From MariaDB 10.0, a blank host field is the same as the % wildcard.
Db	char(64)	NO	PRI		Database (together with User and Host makes up the unique identifier for this record.
User	char(80)	NO	PRI		User (together with Host and Db makes up the unique identifier for this record.
Select_priv	enum('N','Y')	NO		N	Can perform SELECT statements.
Insert_priv	enum('N','Y')	NO		N	Can perform INSERT statements.

Field	Type	Null	Key	Default	Description
Update_priv	enum('N','Y')	NO		N	Can perform UPDATE statements.
Delete_priv	enum('N','Y')	NO		N	Can perform DELETE statements.
Create_priv	enum('N','Y')	NO		N	Can CREATE TABLE's.
Drop_priv	enum('N','Y')	NO		N	Can DROP DATABASE's or DROP TABLE's.
Grant_priv	enum('N','Y')	NO		N	User can grant privileges they possess.
References_priv	enum('N','Y')	NO		N	Unused
Index_priv	enum('N','Y')	NO		N	Can create an index on a table using the CREATE INDEX statement. Without the INDEX privilege, user can still create indexes when creating a table using the CREATE TABLE statement if the user has have the CREATE privilege, and user can create indexes using the ALTER TABLE statement if they have the ALTER privilege.
Alter_priv	enum('N','Y')	NO		N	Can perform ALTER TABLE statements.
Create_tmp_table_priv	enum('N','Y')	NO		N	Can create temporary tables with the CREATE TEMPORARY TABLE statement.
Lock_tables_priv	enum('N','Y')	NO		N	Acquire explicit locks using the LOCK TABLES statement; user also needs to have the SELECT privilege on a table in order to lock it.
Create_view_priv	enum('N','Y')	NO		N	Can create a view using the CREATE_VIEW statement.
Show_view_priv	enum('N','Y')	NO		N	Can show the CREATE VIEW statement to create a view using the SHOW CREATE VIEW statement.
Create_routine_priv	enum('N','Y')	NO		N	Can create stored programs using the CREATE PROCEDURE and CREATE FUNCTION statements.
Alter_routine_priv	enum('N','Y')	NO		N	Can change the characteristics of a stored function using the ALTER FUNCTION statement.
Execute_priv	enum('N','Y')	NO		N	Can execute stored procedure or functions.
Event_priv	enum('N','Y')	NO		N	Create, drop and alter events.

Field	Type	Null	Key	Default	Description
Trigger_priv	enum('N','Y')	NO		N	Can execute triggers associated with tables the user updates, execute the CREATE TRIGGER and DROP TRIGGER statements.
Delete_history_priv	enum('N','Y')	NO		N	Can delete rows created through system versioning.

The Acl_database_grants status variable indicates how many rows the `mysql.db` table contains.

This page is licensed: CC BY-SA / Gnu FDL

mysql.event Table

The `mysql.event` table contains information about MariaDB events. Similar information can be obtained by viewing the INFORMATION_SCHEMA.EVENTS table, or with the SHOW EVENTS and SHOW CREATE EVENT statements.

The table is upgraded live, and there is no need to restart the server if the table has changed.

This table uses the Aria storage engine.

The `mysql.event` table contains the following fields:

Field	Type	Null	Key	Default	Description
db	char(64)	NO	PRI		
name	char(64)	NO	PRI		
body	longblob	NO		NULL	
definer	char(141)	NO			
execute_at	datetime	YES		NULL	
interval_value	int(11)	YES		NULL	
interval_field	enum('YEAR', 'QUARTER', 'MONTH', 'DAY', 'HOUR', 'MINUTE', 'WEEK', 'SECOND', 'MICROSECOND', 'YEAR_MONTH', 'DAY_HOUR', 'DAY_MINUTE', 'DAY_SECOND', 'HOUR_MINUTE', 'HOUR_SECOND', 'MINUTE_SECOND', 'DAY_MICROSECOND', 'HOUR_MICROSECOND', 'MINUTE_MICROSECOND', 'SECOND_MICROSECOND')	YES		NULL	

Field	Type	Null	Key	Default	Description
created	timestamp	NO		CURRENT_TIMESTAMP	
modified	timestamp	NO		0000-00-00 00:00:00	
last_executed	datetime	YES		NULL	
starts	datetime	YES		NULL	
ends	datetime	YES		NULL	
status	enum('ENABLED', 'DISABLED', 'SLAVESIDE_DISABLED')	NO		ENABLED	Current status of the event, one of enabled, disabled, or disabled on the slaveside.
on_completion	enum('DROP','PRESERVE')	NO		DROP	
sql_mode	set('REAL_AS_FLOAT', 'PIPES_AS_CONCAT', 'ANSI_QUOTES', 'IGNORE_SPACE', 'IGNORE_BAD_TABLE_OPTIONS', 'ONLY_FULL_GROUP_BY', 'NO_UNSIGNED_SUBTRACTION', 'NO_DIR_IN_CREATE', 'POSTGRESQL', 'ORACLE', 'MSSQL', 'DB2', 'MAXDB', 'NO_KEY_OPTIONS', 'NO_TABLE_OPTIONS', 'NO_FIELD_OPTIONS', 'MYSQL323', 'MYSQL40', 'ANSI', 'NO_AUTO_VALUE_ON_ZERO', 'NO_BACKSLASH_ESCAPES', 'STRICT_TRANS_TABLES', 'STRICT_ALL_TABLES', 'NO_ZERO_IN_DATE', 'NO_ZERO_DATE', 'INVALID_DATES', 'ERROR_FOR_DIVISION_BY_ZERO', 'TRADITIONAL', 'NO_AUTO_CREATE_USER', 'HIGH_NOT_PRECEDENCE', 'NO_ENGINE_SUBSTITUTION', 'PAD_CHAR_TO_FULL_LENGTH')	NO			The SQL_MODE at the time the event was created.
comment	char(64)	NO			
originator	int(10) unsigned	NO		NULL	

Field	Type	Null	Key	Default	Description
time_zone	char(64)	NO		SYSTEM	
character_set_client	char(32)	YES		NULL	
collation_connection	char(32)	YES		NULL	
db_collation	char(32)	YES		NULL	
body_utf8	longblob	YES		NULL	

This page is licensed: CC BY-SA / Gnu FDL

mysql.func Table

The `mysql.func` table stores information about user-defined functions (UDFs) created with the CREATE FUNCTION UDF statement.

This table uses the Aria storage engine.

The `mysql.func` table contains the following fields:

Field	Type	Null	Key	Default	Description
name	char(64)	NO	PRI		UDF name
ret	tinyint(1)	NO		0	
dl	char(128)	NO			Shared library name
type	enum('function','aggregate')	NO		NULL	Type, either function or aggregate. Aggregate functions are summary functions such as SUM() and AVG().

Example

```
SELECT * FROM mysql.func;
+------------------------------+-----+--------------+-----------+
| name                         | ret | dl           | type      |
+------------------------------+-----+--------------+-----------+
| spider_direct_sql            |   2 | ha_spider.so | function  |
| spider_bg_direct_sql         |   2 | ha_spider.so | aggregate |
| spider_ping_table            |   2 | ha_spider.so | function  |
| spider_copy_tables           |   2 | ha_spider.so | function  |
| spider_flush_table_mon_cache |   2 | ha_spider.so | function  |
+------------------------------+-----+--------------+-----------+
```

This page is licensed: CC BY-SA / Gnu FDL

mysql.general_log Table

The `mysql.general_log` table stores the contents of the General Query Log if general logging is active and the output is being written to table (see Writing logs into tables).

It contains the following fields:

Field	Type	Null	Key	Default	Description
event_time	timestamp(6)	NO		CURRENT_TIMESTAMP(6)	Time the query was executed.
user_host	mediumtext	NO		NULL	User and host combination.
thread_id	int(11)	NO		NULL	Thread id.
server_id	int(10) unsigned	NO		NULL	Server id.
command_type	varchar(64)	NO		NULL	Type of command.
argument	mediumtext	NO		NULL	Full query.

Example

```
SELECT * FROM mysql.general_log\G
*************************** 1. row ***************************
  event_time: 2014-11-11 08:40:04.117177
   user_host: root[root] @ localhost []
   thread_id: 74
   server_id: 1
command_type: Query
    argument: SELECT * FROM test.s
*************************** 2. row ***************************
  event_time: 2014-11-11 08:40:10.501131
   user_host: root[root] @ localhost []
   thread_id: 74
   server_id: 1
command_type: Query
    argument: SELECT * FROM mysql.general_log
...
```

This page is licensed: CC BY-SA / Gnu FDL

mysql.global_priv Table

The `mysql.global_priv` table contains information about users that have permission to access the MariaDB server, and their global privileges.

Note that the MariaDB privileges occur at many levels. A user may not be granted `CREATE` privilege at the user level, but may still have `CREATE` permission on certain tables or databases, for example. See privileges for a more complete view of the MariaDB privilege system.

The `mysql.global_priv` table contains the following fields:

Field	Type	Null	Key	Default	Description
Host	char(60)	NO	PRI		Host (together with User makes up the unique identifier for this account).
User	char(80)	NO	PRI		User (together with Host makes up the unique identifier for this account).
Priv	longtext	NO			Global privileges, granted to the account and other account properties

From MariaDB 10.5.2, in order to help the server understand which version a privilege record was written by, the `priv` field contains a new JSON field, `version_id` (MDEV-21704).

From MariaDB 13.1, the `Priv` field also holds a `denies` array, recording the negative privileges created with DENY. Denies are stored here for every privilege level, not in `mysql.db`, `mysql.tables_priv`, or `mysql.columns_priv`. See The denies Field.

Examples

```
SELECT * FROM mysql.global_priv;
+-----------+-------------+-------------------------------------------------------------------------------
-------------------------------------------------------+
| Host      | User        | Priv
|
+-----------+-------------+-------------------------------------------------------------------------------
-------------------------------------------------------+
| localhost | root        | {"access":

}           |
+-----------------------------------------------------------------------------------------+
```

A particular user:

```
SELECT CONCAT(user, '@', host, ' => ', JSON_DETAILED(priv)) FROM mysql.global_priv
  WHERE user='marijn';
+-----------------------------------------------------------------------------------------+
| CONCAT(user, '@', host, ' => ', JSON_DETAILED(priv))                                    |
+-----------------------------------------------------------------------------------------+
| marijn@localhost => {
    "access": 0,
    "plugin": "mysql_native_password",
    "authentication_string": "",
    "account_locked": true,
    "password_last_changed": 1558017158
} |
+-----------------------------------------------------------------------------------------+
```

From MariaDB 10.5.2:

```
GRANT FILE ON *.* TO user1@localhost;
SELECT Host, User, JSON_DETAILED(Priv) FROM mysql.global_priv WHERE user='user1'\G

*************************** 1. row ***************************
               Host: localhost
               User: user1
JSON_DETAILED(Priv): {
    "access": 512,
    "plugin": "mysql_native_password",
    "authentication_string": "",
    "password_last_changed": 1581070979,
    "version_id": 100502
}
```

Mapping the `access` Field Values to Grants

The `access` field contains the grants of the user which can be mapped to individual grants with the following table. The most up-to-date information can be found in the `sql/privilege.h` file in the source code.

Grant	Bit
SELECT	(1UL << 0)
INSERT	(1UL << 1)
UPDATE	(1UL << 2)
DELETE	(1UL << 3)
CREATE	(1UL << 4)
DROP	(1UL << 5)

Grant	Bit
RELOAD	(1UL << 6)
SHUTDOWN	(1UL << 7)
PROCESS	(1UL << 8)
FILE	(1UL << 9)
GRANT	(1UL << 10)
REFERENCES	(1UL << 11)
INDEX	(1UL << 12)
ALTER	(1UL << 13)
SHOW_DB	(1UL << 14)
SUPER	(1UL << 15)
CREATE_TMP	(1UL << 16)
LOCK_TABLES	(1UL << 17)
EXECUTE	(1UL << 18)
REPL_SLAVE	(1UL << 19)
BINLOG_MONITOR	(1UL << 20)
CREATE_VIEW	(1UL << 21)
SHOW_VIEW	(1UL << 22)
CREATE_PROC	(1UL << 23)
ALTER_PROC	(1UL << 24)
CREATE_USER	(1UL << 25)
EVENT	(1UL << 26)
TRIGGER	(1UL << 27)
CREATE_TABLESPACE	(1UL << 28)
DELETE_HISTORY	(1UL << 29)
SET_USER	(1UL << 30)
FEDERATED_ADMIN	(1UL << 31)
CONNECTION_ADMIN	(1ULL << 32)
READ_ONLY_ADMIN	(1ULL << 33)
REPL_SLAVE_ADMIN	(1ULL << 34)
REPL_MASTER_ADMIN	(1ULL << 35)
BINLOG_ADMIN	(1ULL << 36)
BINLOG_REPLAY	(1ULL << 37)
SLAVE_MONITOR	(1ULL << 38)
SHOW_CREATE_ROUTINE	(1ULL << 39)

The `denies` Field

From MariaDB 13.1, the `denies` array records the privileges that DENY blocks for an account or role. Each element describes one privilege level:

```
DENY SELECT ON hr.* TO user1@localhost;
DENY SELECT (salary) ON hr.staff TO user1@localhost;
SELECT JSON_PRETTY(JSON_EXTRACT(Priv, '$.denies')) FROM mysql.global_priv
  WHERE User='user1'\G

*************************** 1. row ***************************
JSON_PRETTY(JSON_EXTRACT(Priv, '$.denies')): [
    {
        "type": "db",
        "db": "hr",
        "bits": 1
    },
    {
        "type": "column",
        "db": "hr",
        "table": "staff",
        "column": "salary",
        "bits": 1
    }
]
```

The fields of an element are:

Field	Description
`type`	The privilege level: `global`, `db`, `table`, `column`, `function`, `procedure`, `package`, or `package body`.
`db`	Database name. Absent for `global`.
`table`	Table name, for `table` and `column` entries.
`column`	Column name, for `column` entries.
`function`, `procedure`, `package`, `package body`	Routine name, named after the entry's `type`.
`bits`	The denied privileges, using the same bit values as the `access` field.

An account with no denies has either no `denies` key or an empty array.

> **Warning:**
>
> Do not edit the `denies` array with `UPDATE`. A malformed entry is skipped when privileges are loaded, with a `Malformed DENY entry in mysql.global_priv` warning written to the error log, which leaves the privilege allowed. Use `DENY` and `REVOKE DENY` instead.

mysql.gtid_slave_pos Table

The `mysql.gtid_slave_pos` table is used in replication by replica servers to keep track of their current position (the global transaction ID of the last transaction applied). Using the table allows the replica to maintain a consistent value for the gtid_slave_pos system variable across server restarts. See Global Transaction ID.

You should never attempt to modify the table directly. If you do need to change the global `gtid_slave_pos` value, use `SET GLOBAL gtid_slave_pos = ...` instead.

The table is updated with the new position as part of each transaction committed during replication. This makes it preferable that the table is using the same storage engine as the tables otherwise being modified in the transaction, since otherwise a multi-engine transaction is needed that can reduce performance.

Multiple versions of this table are supported, each using a different storage engine. This is selected with the gtid_pos_auto_engines option, by giving a comma-separated list of engine names. The server will then on-demand

create an extra version of the table using the appropriate storage engine, and select the table version using the same engine as the rest of the transaction, avoiding multi-engine transactions.

When `gtid_pos_auto_engines=innodb,rocksdb` is set, the tables `mysql.gtid_slave_pos_InnoDB` and `mysql.gtid_slave_pos_RocksDB` are created and used, if needed. If there is no match to the storage engine, the default `mysql.gtid_slave_pos` table is used; this also happens if non-transactional updates (like MyISAM) are replicated, since there is then no active transaction at the time of the `mysql.gtid_slave_pos` table update.

The default `mysql.gtid_slave_pos` table is initially created using the default storage engine set for the server (which itself defaults to InnoDB). If the application load is primarily non-transactional MyISAM or Aria tables, it can be beneficial to change the storage engine to avoid including an InnoDB update with every operation:

```
ALTER TABLE mysql.gtid_slave_pos ENGINE=MyISAM;
```

The `mysql.gtid_slave_pos` table should not be changed manually in any other way. It is preferable to use the `gtid_pos_auto_engines` server variable to get the GTID position updates to use the RocksDB storage engine.

Note that, for scalability reasons, the automatic creation of a new `mysql.gtid_slave_posXXX` table happens asynchronously when the first transaction with the new storage engine is committed. So the very first few transactions will update the old version of the table, until the new version is created and available.

The table `mysql.gtid_slave_pos` contains the following fields:

Field	Type	Null	Key	Default	Description
domain_id	int(10) unsigned	NO	PRI	NULL	Domain id (see Global Transaction ID domain ID.
sub_id	bigint(20) unsigned	NO	PRI	NULL	This field enables multiple parallel transactions within same domain_id to update this table without contention. At any instant, the replication state corresponds to records with largest sub_id for each domain_id.
server_id	int(10) unsigned	NO		NULL	Server id.
seq_no	bigint(20) unsigned	NO		NULL	Sequence number, an integer that is monotonically increasing for each new event group logged into the binlog.

Some status variables are available to monitor the use of the different `gtid_slave_pos` table versions:

Transactions_gtid_foreign_engine

Number of replicated transactions where the update of the `gtid_slave_pos` table had to choose a storage engine that did not otherwise participate in the transaction. This can indicate that setting `gtid_pos_auto_engines` might be useful.

Rpl_transactions_multi_engine

Number of replicated transactions that involved changes in multiple (transactional) storage engines, before considering the update of `gtid_slave_pos`. These are transactions that were already cross-engine, independent of the GTID position update introduced by replication

Transactions_multi_engine

Number of transactions that changed data in multiple (transactional) storage engines. If this is significantly larger than `Rpl_transactions_multi_engine`, it indicates that setting `gtid_pos_auto_engines` could reduce the need for cross-engine transactions.

mysql.help_category Table

`mysql.help_category` is one of the four tables used by the HELP command. It is populated when the server is installed by the `fill_help_tables.sql` script. The other help tables are help_relation, help_topic and help_keyword.

This table uses the Aria storage engine.

The `mysql.help_category` table contains the following fields:

Field	Type	Null	Key	Default	Description
help_category_id	smallint(5) unsigned	NO	PRI	NULL	
name	char(64)	NO	UNI	NULL	
parent_category_id	smallint(5) unsigned	YES		NULL	
url	char(128)	NO		NULL	

Example

```
SELECT * FROM help_category;
+------------------+----------------------------------------------+--------------------+-----+
| help_category_id | name                                         | parent_category_id | url |
+------------------+----------------------------------------------+--------------------+-----+
|                1 | Geographic                                   |                  0 |     |
|                2 | Polygon properties                           |                 34 |     |
|                3 | WKT                                          |                 34 |     |
|                4 | Numeric Functions                            |                 38 |     |
|                5 | Plugins                                      |                 35 |     |
|                6 | MBR                                          |                 34 |     |
|                7 | Control flow functions                       |                 38 |     |
|                8 | Transactions                                 |                 35 |     |
|                9 | Help Metadata                                |                 35 |     |
|               10 | Account Management                           |                 35 |     |
|               11 | Point properties                             |                 34 |     |
|               12 | Encryption Functions                         |                 38 |     |
|               13 | LineString properties                        |                 34 |     |
|               14 | Miscellaneous Functions                      |                 38 |     |
|               15 | Logical operators                            |                 38 |     |
|               16 | Functions and Modifiers for Use with GROUP BY |                 35 |     |
|               17 | Information Functions                        |                 38 |     |
|               18 | Comparison operators                         |                 38 |     |
|               19 | Bit Functions                                |                 38 |     |
|               20 | Table Maintenance                            |                 35 |     |
|               21 | User-Defined Functions                       |                 35 |     |
|               22 | Data Types                                   |                 35 |     |
|               23 | Compound Statements                          |                 35 |     |
|               24 | Geometry constructors                        |                 34 |     |

mysql.help_keyword Table

`mysql.help_keyword` is one of the four tables used by the HELP command. It is populated when the server is installed by the `fill_help_tables.sql` script. The other help tables are help_relation, help_category and help_topic.

This table uses the Aria storage engine.

The `mysql.help_keyword` table contains the following fields:

Field	Type	Null	Key	Default	Description
help_keyword_id	int(10) unsigned	NO	PRI	NULL	
name	char(64)	NO	UNI	NULL	

Example

```
SELECT * FROM help_keyword;
+-----------------+-------------------------------+
| help_keyword_id | name                          |
+-----------------+-------------------------------+
|               0 | JOIN                          |
|               1 | HOST                          |
|               2 | REPEAT                        |
|               3 | SERIALIZABLE                  |
|               4 | REPLACE                       |
|               5 | AT                            |
|               6 | SCHEDULE                      |
|               7 | RETURNS                       |
|               8 | STARTS                        |
|               9 | MASTER_SSL_CA                 |
|              10 | NCHAR                         |
|              11 | COLUMNS                       |
|              12 | COMPLETION                    |
...
```

This page is licensed: CC BY-SA / Gnu FDL

mysql.help_relation Table

`mysql.help_relation` is one of the four tables used by the HELP command. It is populated when the server is installed by the `fill_help_tables.sql` script. The other help tables are help_topic, help_category and help_keyword.

This table uses the Aria storage engine.

The `mysql.help_relation` table contains the following fields:

Field	Type	Null	Key	Default	Description
help_topic_id	int(10) unsigned	NO	PRI	NULL	
help_keyword_id	int(10) unsigned	NO	PRI	NULL	

Example

```
...
|           106 |             456 |
|           463 |             456 |
|           468 |             456 |
|           463 |             457 |
|           194 |             458 |
|           478 |             458 |
|           374 |             459 |
|           459 |             459 |
|            39 |             460 |
|            58 |             460 |
|           185 |             460 |
|           264 |             460 |

mysql.help_topic Table

`mysql.help_topic` is one of the four tables used by the HELP command. It is populated when the server is installed by the `fill_help_tables.sql` script. The other help tables are help_relation, help_category and help_keyword.

This table uses the Aria storage engine.

The `mysql.help_topic` table contains the following fields:

Field	Type	Null	Key	Default	Description
help_topic_id	int(10) unsigned	NO	PRI	NULL	
name	char(64)	NO	UNI	NULL	
help_category_id	smallint(5) unsigned	NO		NULL	
description	text	NO		NULL	
example	text	NO		NULL	
url	char(128)	NO		NULL	

Example

```
SELECT * FROM help_topic\G;
...
*************************** 704. row ***************************
   help_topic_id: 692
           name: JSON_DEPTH
help_category_id: 41
     description: JSON functions were added in MariaDB 10.2.3.

Syntax
------
JSON_DEPTH(json_doc)

Description
-----------
Returns the maximum depth of the given JSON document, or
NULL if the argument is null. An error will occur if the
argument is an invalid JSON document.
Scalar values or empty arrays or objects have a depth of 1.
Arrays or objects that are not empty but contain only
elements or member values of depth 1 will have a depth of 2.
In other cases, the depth will be greater than 2.

Examples
--------
SELECT JSON_DEPTH('[]'), JSON_DEPTH('true'),
JSON_DEPTH('{}');
+------------------+--------------------+------------------+
| JSON_DEPTH('[]') | JSON_DEPTH('true') |
JSON_DEPTH('{}') |
+------------------+--------------------+------------------+
| 1 | 1 | 1 |
+------------------+--------------------+------------------+

SELECT JSON_DEPTH('[1, 2, 3]'), JSON_DEPTH('[[], {},
[]]');
+-------------------------+----------------------------+
| JSON_DEPTH('[1, 2, 3]') | JSON_DEPTH('[[], {}, []]') |
+-------------------------+----------------------------+
| 2 | 2 |
+-------------------------+----------------------------+

SELECT JSON_DEPTH('[1, 2, [3, 4, 5, 6], 7]');
+---------------------------------------+
| JSON_DEPTH('[1, 2, [3, 4, 5, 6], 7]') |
+---------------------------------------+
| 3 |
+---------------------------------------+

URL: https://mariadb.com/kb/en/json_depth/
         example:
             url: https://mariadb.com/kb/en/json_depth/
```

mysql.index_stats Table

The `mysql.index_stats` table is one of three tables storing data used for Engine-independent table statistics. The others are mysql.column_stats and mysql.table_stats.

It is populated when the ANALYZE TABLE statement is run, although not by default. See Collecting Statistics with the ANALYZE TABLE Statement for details.

It is possible to manually update the table and, unlike most system tables, there are some scenarios where this could be useful. See Manual updates to statistics tables for details.

This table uses the Aria storage engine.

The `mysql.index_stats` table contains the following fields:

Field	Type	Null	Key	Default	Description
db_name	varchar(64)	NO	PRI	NULL	Database the table is in.
table_name	varchar(64)	NO	PRI	NULL	Table name
index_name	varchar(64)	NO	PRI	NULL	Name of the index
prefix_arity	int(11) unsigned	NO	PRI	NULL	Index prefix length. 1 for the first keypart, 2 for the first two, and so on. InnoDB's extended keys are supported.
avg_frequency	decimal(12,4)	YES		NULL	Average number of records one will find for given values of (keypart1, keypart2, ..), provided the values will be found in the table.

It is possible to manually update the table. See Manual updates to statistics tables for details.

This page is licensed: CC BY-SA / Gnu FDL

mysql.innodb_index_stats

The `mysql.innodb_index_stats` table stores data related to particular InnoDB Persistent Statistics, and contains multiple rows for each index.

This table, along with the related mysql.innodb_table_stats table, can be manually updated in order to force or test differing query optimization plans. After updating, FLUSH TABLE innodb_index_stats is required to load the changes.

`mysql.innodb_index_stats` is not replicated, although any ANALYZE TABLE statements on the table will be by default..

It contains the following fields:

Field	Type	Null	Key	Default	Description
database_name	varchar(64)	NO	PRI	NULL	Database name.
table_name	varchar(64)	NO	PRI	NULL	Table, partition or subpartition name.
index_name	varchar(64)	NO	PRI	NULL	Index name.
last_update	timestamp	NO		current_timestamp()	Time that this row was last updated.
stat_name	varchar(64)	NO	PRI	NULL	Statistic name.
stat_value	bigint(20) unsigned	NO		NULL	Estimated statistic value.
sample_size	bigint(20) unsigned	YES		NULL	Number of pages sampled for the estimated statistic value.
stat_description	varchar(1024)	NO		NULL	Statistic description.

Example

```
SELECT * FROM mysql.innodb_index_stats\G
*************************** 1. row ***************************
   database_name: mysql
      table_name: gtid_slave_pos
      index_name: PRIMARY
     last_update: 2017-08-19 20:38:34
       stat_name: n_diff_pfx01
      stat_value: 0
     sample_size: 1
stat_description: domain_id
*************************** 2. row ***************************
   database_name: mysql
      table_name: gtid_slave_pos
      index_name: PRIMARY
     last_update: 2017-08-19 20:38:34
       stat_name: n_diff_pfx02
      stat_value: 0
     sample_size: 1
stat_description: domain_id,sub_id
*************************** 3. row ***************************
   database_name: mysql
      table_name: gtid_slave_pos
      index_name: PRIMARY
     last_update: 2017-08-19 20:38:34
       stat_name: n_leaf_pages
      stat_value: 1
     sample_size: NULL
stat_description: Number of leaf pages in the index
*************************** 4. row ***************************
   database_name: mysql
      table_name: gtid_slave_pos
      index_name: PRIMARY
     last_update: 2017-08-19 20:38:34
       stat_name: size
      stat_value: 1
     sample_size: NULL
stat_description: Number of pages in the index
*************************** 5. row ***************************
   database_name: test
      table_name: ft
      index_name: FTS_DOC_ID_INDEX
     last_update: 2017-09-15 12:58:39
       stat_name: n_diff_pfx01
      stat_value: 0
     sample_size: 1
stat_description: FTS_DOC_ID
*************************** 6. row ***************************
   database_name: test
      table_name: ft
      index_name: FTS_DOC_ID_INDEX
     last_update: 2017-09-15 12:58:39
       stat_name: n_leaf_pages
      stat_value: 1
     sample_size: NULL
stat_description: Number of leaf pages in the index
...
```

mysql.innodb_table_stats

The `mysql.innodb_table_stats` table stores data related to InnoDB Persistent Statistics, and contains one row per table.

This table, along with the related mysql.innodb_index_stats table, can be manually updated in order to force or test differing query optimization plans. After updating, FLUSH TABLE innodb_table_stats is required to load the changes.

`mysql.innodb_table_stats` is not replicated, although any ANALYZE TABLE statements on the table will be by default.

It contains the following fields:

Field	Type	Null	Key	Default	Description
database_name	varchar(64)	NO	PRI	NULL	Database name.
table_name	varchar(64)	NO	PRI	NULL	Table, partition or subpartition name.
last_update	timestamp	NO		current_timestamp()	Time that this row was last updated.
n_rows	bigint(20) unsigned	NO		NULL	Number of rows in the table.
clustered_index_size	bigint(20) unsigned	NO		NULL	Size, in pages, of the primary index.
sum_of_other_index_sizes	bigint(20) unsigned	NO		NULL	Size, in pages, of non-primary indexes.

Example

```
SELECT * FROM mysql.innodb_table_stats\G
*************************** 1. row ***************************
           database_name: mysql
              table_name: gtid_slave_pos
             last_update: 2017-08-19 20:38:34
                 n_rows: 0
    clustered_index_size: 1
sum_of_other_index_sizes: 0
*************************** 2. row ***************************
           database_name: test
              table_name: ft
             last_update: 2017-09-15 12:58:39
                 n_rows: 0
    clustered_index_size: 1
sum_of_other_index_sizes: 2
...

mysql.password_reuse_check_history Table

> **Note:**
>
> This table is available from MariaDB 10.7.

The mysql.password_reuse_check_history Table is installed as part of the password_reuse_check plugin.

The `mysql.password_reuse_check_history` table stores old passwords, so that when a user sets a new password, it can be checked for purposes of preventing password reuse.

It contains the following fields:

Field	Type	Null	Key	Default	Description
hash	binary(64)	NO	PRI	NULL	
time	timestamp	NO	MUL	current_timestamp()	

This page is licensed: CC BY-SA / Gnu FDL

mysql.plugin Table

1. PARTITION BY SYSTEM_TIME is not supported for transaction-precise system-versioned tables. Attempting

The `mysql.plugin` table can be queried to get information about installed plugins.

This table only contains information about plugins that have been installed via the following methods:

- The INSTALL SONAME statement.
- The INSTALL PLUGIN statement.
- The mariadb-plugin utility.

This table does not contain information about:

- Built-in plugins.
- Plugins loaded with the –plugin-load-add option.
- Plugins loaded with the –plugin-load option.

This table only contains enough information to reload the plugin when the server is restarted, which means it only contains the plugin name and the plugin library.

This table uses the Aria storage engine.

The `mysql.plugin` table contains the following fields:

Field	Type	Null	Key	Default	Description
name	varchar(64)	NO	PRI		Plugin name.
dl	varchar(128)	NO			Name of the plugin library.

Example

```
SELECT * FROM mysql.plugin;
+---------------------------+-----------------------+
| name                      | dl                    |
+---------------------------+-----------------------+
| spider                    | ha_spider.so          |
| spider_alloc_mem          | ha_spider.so          |
| METADATA_LOCK_INFO        | metadata_lock_info.so |
| OQGRAPH                   | ha_oqgraph.so         |
| QUERY_RESPONSE_TIME       | query_response_time.so |
| QUERY_RESPONSE_TIME_AUDIT | query_response_time.so |
| LOCALES                   | locales.so            |
| sequence                  | ha_sequence.so        |
+---------------------------+-----------------------+
```

mysql.proc Table

The `mysql.proc` table contains information about stored procedures and stored functions. It contains similar information to that stored in the INFORMATION SCHEMA.ROUTINES table.

This table uses the Aria storage engine.

The `mysql.proc` table contains the following fields:

Field	Type	Null	Key	Default	Description
db	char(64)	NO	PRI		Database name.
name	char(64)	NO	PRI		Routine name.
type	enum('FUNCTION','PROCEDURE','PACKAGE', 'PACKAGE BODY')	NO	PRI	NULL	Whether stored procedure, stored function or a package or package body.
specific_name	char(64)	NO			
language	enum('SQL')	NO		SQL	Always SQL.
sql_data_access	enum('CONTAINS_SQL', 'NO_SQL', 'READS_SQL_DATA', 'MODIFIES_SQL_DATA')	NO		CONTAINS_SQL	
is_deterministic	enum('YES','NO')	NO		NO	Whether the routine is deterministic (can produce only one result for a given list of parameters) or not.
security_type	enum('INVOKER','DEFINER')	NO		DEFINER	INVOKER or DEFINER. Indicates which user's privileges apply to this routine.
param_list	blob	NO		NULL	List of parameters.
returns	longblob	NO		NULL	What the routine returns.

Field	Type	Null	Key	Default	Description
body	longblob	NO		NULL	Definition of the routine.
definer	char(141)	NO			If the security_type is DEFINER, this value indicates which user defined this routine.
created	timestamp	NO		CURRENT_TIMESTAMP	Date and time the routine was created.
modified	timestamp	NO		0000-00-00 00:00:00	Date and time the routine was modified.
sql_mode	set('REAL_AS_FLOAT', 'PIPES_AS_CONCAT', 'ANSI_QUOTES', 'IGNORE_SPACE', 'IGNORE_BAD_TABLE_OPTIONS', 'ONLY_FULL_GROUP_BY', 'NO_UNSIGNED_SUBTRACTION', 'NO_DIR_IN_CREATE', 'POSTGRESQL', 'ORACLE', 'MSSQL', 'DB2', 'MAXDB', 'NO_KEY_OPTIONS', 'NO_TABLE_OPTIONS', 'NO_FIELD_OPTIONS', 'MYSQL323', 'MYSQL40', 'ANSI', 'NO_AUTO_VALUE_ON_ZERO', 'NO_BACKSLASH_ESCAPES', 'STRICT_TRANS_TABLES', 'STRICT_ALL_TABLES', 'NO_ZERO_IN_DATE', 'NO_ZERO_DATE', 'INVALID_DATES', 'ERROR_FOR_DIVISION_BY_ZERO', 'TRADITIONAL', 'NO_AUTO_CREATE_USER', 'HIGH_NOT_PRECEDENCE', 'NO_ENGINE_SUBSTITUTION', 'PAD_CHAR_TO_FULL_LENGTH', 'EMPTY_STRING_IS_NULL', 'SIMULTANEOUS_ASSIGNMENT')	NO			The SQL_MODE at the time the routine was created.
comment	text	NO		NULL	Comment associated with the routine.
character_set_client	char(32)	YES		NULL	The character set used by the client that created the routine.
collation_connection	char(32)	YES		NULL	The collation (and character set) used by the connection that created the routine.

Field	Type	Null	Key	Default	Description
db_collation	char(32)	YES		NULL	The default collation (and character set) for the database, at the time the routine was created.
body_utf8	longblob	YES		NULL	Definition of the routine in utf8.
aggregate	enum('NONE', 'GROUP')	NO		NONE	
Field	Type	Null	Key	Default	Description

mysql.procs_priv Table

1. PARTITION BY SYSTEM_TIME is not supported for transaction-precise system-versioned tables. Attempting

The `mysql.procs_priv` table contains information about stored procedure and stored function privileges. See CREATE PROCEDURE and CREATE FUNCTION on creating these.

The INFORMATION_SCHEMA.ROUTINES table derives its contents from `mysql.procs_priv`.

This table uses the Aria storage engine.

The `mysql.procs_priv` table contains the following fields:

Field	Type	Null	Key	Default	Description
Host	char(60)	NO	PRI		Host (together with Db, User, Routine_name and Routine_type makes up the unique identifier for this record).
Db	char(64)	NO	PRI		Database (together with Host, User, Routine_name and Routine_type makes up the unique identifier for this record).
User	char(80)	NO	PRI		User (together with Host, Db, Routine_name and Routine_type makes up the unique identifier for this record).
Routine_name	char(64)	NO	PRI		Routine_name (together with Host, Db User and Routine_type makes up the unique identifier for this record).
Routine_type	enum('FUNCTION','PROCEDURE', 'PACKAGE', 'PACKAGE BODY')	NO	PRI	NULL	Whether the routine is a stored procedure, stored function, package or package body.
Grantor	char(141)	NO	MUL		

Field	Type	Null	Key	Default	Description
Proc_priv	set('Execute','Alter Routine','Grant')	NO			The routine privilege. See Function Privileges and Procedure Privileges for details.
Timestamp	timestamp	NO		CURRENT_TIMESTAMP	

The Acl_function_grants status variable indicates how many rows the `mysql.columns_priv` table contains with the `FUNCTION` routine type.

The Acl_procedure_grants status variable indicates how many rows the `mysql.columns_priv` table contains with the `PROCEDURE` routine type.

This page is licensed: CC BY-SA / Gnu FDL

mysql.proxies_priv Table

1. PARTITION BY SYSTEM_TIME is not supported for transaction-precise system-versioned tables. Attempting

The `mysql.proxies_priv` table contains information about proxy privileges. The table can be queried and although it is possible to directly update it, it is best to use GRANT for setting privileges.

This table uses the Aria storage engine.

The `mysql.proxies_priv` table contains the following fields:

Field	Type	Null	Key	Default	Description
Host	char(60)	NO	PRI		
User	char(80)	NO	PRI		
Proxied_host	char(60)	NO	PRI		
Proxied_user	char(80)	NO	PRI		
With_grant	tinyint(1)	NO		0	
Grantor	char(141)	NO	MUL		
Timestamp	timestamp	NO		CURRENT_TIMESTAMP	

The Acl_proxy_users status variable indicates how many rows the `mysql.proxies_priv` table contains.

This page is licensed: CC BY-SA / Gnu FDL

mysql.roles_mapping Table

1. PARTITION BY SYSTEM_TIME is not supported for transaction-precise system-versioned tables. Attempting

The `mysql.roles_mapping` table contains information about mariaDB roles.

This table uses the Aria storage engine.

The `mysql.roles_mapping` table contains the following fields:

Field	Type	Null	Key	Default	Description
Host	char(60)	NO	PRI		Host (together with User and Role makes up the unique identifier for this record.
User	char(80)	NO	PRI		User (together with Host and Role makes up the unique identifier for this record.
Role	char(80)	NO	PRI		Role (together with Host and User makes up the unique identifier for this record.
Admin_option	enum('N','Y')	NO		N	Whether the role can be granted (see the CREATE ROLE WITH ADMIN clause).

The Acl_role_grants status variable indicates how many rows the `mysql.roles_mapping` table contains.

This page is licensed: CC BY-SA / Gnu FDL

mysql.servers Table

1. PARTITION BY SYSTEM_TIME is not supported for transaction-precise system-versioned tables. Attempting

The `mysql.servers` table contains information about servers as used by the Spider, FEDERATED or FederatedX, Connect storage engines.

The contents are modified by the CREATE SERVER, ALTER SERVER and DROP SERVER statements.

This table uses the Aria storage engine.

The `mysql.servers` table contains the following fields:

Field	Type	Null	Key	Default	Description
Server_name	char(64)	NO	PRI		
Host	char(64)	NO			
Db	char(64)	NO			
Username	char(80)	NO			
Password	char(64)	NO			
Port	int(4)	NO		0	
Socket	char(64)	NO			
Wrapper	char(64)	NO			mysql or mariadb
Owner	char(64)	NO			

Example

```
SELECT * FROM mysql.servers\G
*************************** 1. row ***************************
Server_name: s
       Host: 192.168.1.106
         Db: test
   Username: Remote
   Password:
       Port: 0
     Socket:
    Wrapper: mariadb
      Owner:
```

This page is licensed: CC BY-SA / Gnu FDL

mysql.slow_log Table

System tables should not normally be edited directly. Use the related SQL statements instead.

The `mysql.slow_log` table stores the contents of the Slow Query Log if slow logging is active and the output is being written to table (see Writing logs into tables).

It contains the following fields:

Field	Type	Null	Key	Default	Description
start_time	timestamp(6)	NO		CURRENT_TIMESTAMP(6)	Time the query began.

Field	Type	Null	Key	Default	Description
user_host	mediumtext	NO		NULL	User and host combination.
query_time	time(6)	NO		NULL	Total time the query took to execute.
lock_time	time(6)	NO		NULL	Total time the query was locked.
rows_sent	int(11)	NO		NULL	Number of rows sent.
rows_examined	int(11)	NO		NULL	Number of rows examined.
db	varchar(512)	NO		NULL	Default database.
last_insert_id	int(11)	NO		NULL	last_insert_id.
insert_id	int(11)	NO		NULL	Insert id.
server_id	int(10) unsigned	NO		NULL	The server's id.
sql_text	mediumtext	NO		NULL	Full query.
thread_id	bigint(21) unsigned	NO		NULL	Thread id.
rows_affected	int(11)	NO		NULL	Number of rows affected by an UPDATE or DELETE (from MariaDB 10.1.2)

Example

```
SELECT * FROM mysql.slow_log\G
...
*************************** 2. row ***************************
    start_time: 2014-11-11 07:56:28.721519
     user_host: root[root] @ localhost []
    query_time: 00:00:12.000215
     lock_time: 00:00:00.000000
     rows_sent: 1
 rows_examined: 0
            db: test
last_insert_id: 0
     insert_id: 0
     server_id: 1
      sql_text: SELECT SLEEP(12)
     thread_id: 74
...
```

This page is licensed: CC BY-SA / Gnu FDL

mysql.table_stats Table

The `mysql.table_stats` table is one of three tables storing data used for Engine-independent table statistics. The others are mysql.column_stats and mysql.index_stats.

It is populated when the ANALYZE TABLE statement is run, although not by default. See Collecting Statistics with the ANALYZE TABLE Statement for details.

It is possible to manually update the table and, unlike most system tables, there are some scenarios where this could be useful. See Manual updates to statistics tables for details.

This table uses the Aria storage engine.

The `mysql.table_stats` table contains the following fields:

Field	Type	Null	Key	Default	Description
db_name	varchar(64)	NO	PRI	NULL	Database the table is in .
table_name	varchar(64)	NO	PRI	NULL	Table name.
cardinality	bigint(21) unsigned	YES		NULL	Number of records in the table.

This page is licensed: CC BY-SA / Gnu FDL

mysql.tables_priv Table

1. PARTITION BY SYSTEM_TIME is not supported for transaction-precise system-versioned tables. Attempting

The `mysql.tables_priv` table contains information about table-level privileges. The table can be queried and although it is possible to directly update it, it is best to use GRANT for setting privileges.

Note that the MariaDB privileges occur at many levels. A user may be granted a privilege at the table level, but may still not have permission on a database level, for example. See privileges for a more complete view of the MariaDB privilege system.

The INFORMATION_SCHEMA.TABLE_PRIVILEGES table derives its contents from `mysql.tables_priv`.

This table uses the Aria storage engine.

The `mysql.tables_priv` table contains the following fields:

Field	Type	Null	Key	Default	Description
Host	char(60)	NO	PRI		Host (together with User, Db and Table_namemakes up the unique identifier for this record.
Db	char(64)	NO	PRI		Database (together with User, Host and Table_namemakes up the unique identifier for this record.
User	char(80)	NO	PRI		User (together with Host, Db and Table_namemakes up the unique identifier for this record.
Table_name	char(64)	NO	PRI		Table name (together with User, Db and Tablemakes up the unique identifier for this record.
Grantor	char(141)	NO	MUL		
Timestamp	timestamp	NO		CURRENT_TIMESTAMP	
Table_priv	set('Select', 'Insert', 'Update', 'Delete', 'Create', 'Drop', 'Grant', 'References', 'Index', 'Alter', 'Create View', 'Show view', 'Trigger', 'Delete versioning rows')	NO			The table privilege type. See Table Privileges for details.
Column_priv	set('Select', 'Insert', 'Update', 'References')	NO			The column privilege type. See Column Privileges for details.

The Acl_table_grants status variable indicates how many rows the `mysql.tables_priv` table contains.

This page is licensed: CC BY-SA / Gnu FDL

mysql.time_zone Table

The `mysql.time_zone` table is one of the mysql system tables that can contain time zone information. It is usually preferable for the system to handle the time zone, in which case the table will be empty (the default), but you can populate the mysql time zone tables using the mariadb-tzinfo-to-sql utility. See Time Zones for details.

This table uses the Aria storage engine.

The `mysql.time_zone` table contains the following fields:

Field	Type	Null	Key	Default	Description
Time_zone_id	int(10) unsigned	NO	PRI	NULL	ID field, auto_increments.
Use_leap_seconds	enum('Y','N')	NO		N	Whether or not leap seconds are used.

Example

```
SELECT * FROM mysql.time_zone;
+--------------+------------------+
| Time_zone_id | Use_leap_seconds |
+--------------+------------------+
|            1 | N                |
|            2 | N                |
|            3 | N                |
|            4 | N                |
|            5 | N                |
|            6 | N                |

mysql.time_zone_leap_second Table

1. PARTITION BY SYSTEM_TIME is not supported for transaction-precise system-versioned tables. Attempting

The `mysql.time_zone_leap_second` table is one of the mysql system tables that can contain time zone information. It is usually preferable for the system to handle the time zone, in which case the table will be empty (the default), but you can populate the mysql time zone tables using the mariadb-tzinfo-to-sql utility. See Time Zones for details.

This table uses the Aria storage engine.

The `mysql.time_zone_leap_second` table contains the following fields:

Field	Type	Null	Key	Default	Description
Transition_time	bigint(20)	NO	PRI	NULL	
Correction	int(11)	NO		NULL

mysql.time_zone_name Table

1. PARTITION BY SYSTEM_TIME is not supported for transaction-precise system-versioned tables. Attempting

The `mysql.time_zone_name` table is one of the mysql system tables that can contain time zone information. It is usually preferable for the system to handle the time zone, in which case the table will be empty (the default), but you can populate the mysql time zone tables using the mariadb-tzinfo-to-sql utility. See Time Zones for details.

This table uses the Aria storage engine.

The `mysql.time_zone_name` table contains the following fields:

Field	Type	Null	Key	Default	Description
Name	char(64)	NO	PRI	NULL	Name of the time zone.
Time_zone_id	int(10) unsigned	NO	PRI	NULL	ID field, auto_increments.

Example

```
SELECT * FROM mysql.time_zone_name;
+--------------------+--------------+
| Name               | Time_zone_id |
+--------------------+--------------+
| Africa/Abidjan     |            1 |
| Africa/Accra       |            2 |
| Africa/Addis_Ababa |            3 |
| Africa/Algiers     |            4 |
| Africa/Asmara      |            5 |
| Africa/Asmera      |            6 |
| Africa/Bamako      |            7 |
| Africa/Bangui      |            8 |
| Africa/Banjul      |            9 |
| Africa/Bissau      |           10 |
...
+--------------------+--------------+
```

mysql.time_zone_transition Table

1. PARTITION BY SYSTEM_TIME is not supported for transaction-precise system-versioned tables. Attempting

The `mysql.time_zone_transition` table is one of the `mysql` system tables that can contain time zone information. It is usually preferable for the system to handle the time zone, in which case the table will be empty (the default), but you can populate the `mysql` time zone tables using the mariadb-tzinfo-to-sql utility. See Time Zones for details.

This table uses the Aria storage engine.

The `mysql.time_zone_transition` table contains the following fields:

Field	Type	Null	Key	Default	Description
Time_zone_id	int(10) unsigned	NO	PRI	NULL	
Transition_time	bigint(20)	NO	PRI	NULL	
Transition_type_id	int(10) unsigned	NO		NULL	

Example

```
SELECT * FROM mysql.time_zone_transition;
+--------------+-----------------+--------------------+
| Time_zone_id | Transition_time | Transition_type_id |
+--------------+-----------------+--------------------+
|            1 |     -1830383032 |                  1 |
|            2 |     -1640995148 |                  2 |
|            2 |     -1556841600 |                  1 |
|            2 |     -1546388400 |                  2 |
|            2 |     -1525305600 |                  1 |
|            2 |     -1514852400 |                  2 |
|            2 |     -1493769600 |                  1 |
|            2 |     -1483316400 |                  2 |
|            2 |     -1462233600 |                  1 |
|            2 |     -1451780400 |                  2 |
...
+--------------+-----------------+--------------------+
```

mysql.time_zone_transition_type Table

1. PARTITION BY SYSTEM_TIME is not supported for transaction-precise system-versioned tables. Attempting

The `mysql.time_zone_transition_type` table is one of the `mysql` system tables that can contain time zone information. It is usually preferable for the system to handle the time zone, in which case the table will be empty (the default), but you can populate the `mysql` time zone tables using the mariadb-tzinfo-to-sql utility. See Time Zones for details.

This table uses the Aria storage engine.

The `mysql.time_zone_transition_type` table contains the following fields:

Field	Type	Null	Key	Default	Description
Time_zone_id	int(10) unsigned	NO	PRI	NULL	
Transition_type_id	int(10) unsigned	NO	PRI	NULL	
Offset	int(11)	NO		0	
Is_DST	tinyint(3) unsigned	NO		0	
Abbreviation	char(8)	NO			

Example

```
SELECT * FROM mysql.time_zone_transition_type;
+--------------+--------------------+--------+--------+--------------+
| Time_zone_id | Transition_type_id | Offset | Is_DST | Abbreviation |
+--------------+--------------------+--------+--------+--------------+
|            1 |                  0 |   -968 |      0 | LMT          |
|            1 |                  1 |      0 |      0 | GMT          |
|            2 |                  0 |    -52 |      0 | LMT          |
|            2 |                  1 |   1200 |      1 | GHST         |
|            2 |                  2 |      0 |      0 | GMT          |
|            3 |                  0 |   8836 |      0 | LMT          |
|            3 |                  1 |  10800 |      0 | EAT          |
|            3 |                  2 |   9000 |      0 | BEAT         |
|            3 |                  3 |   9900 |      0 | BEAUT        |
|            3 |                  4 |  10800 |      0 | EAT          |

mysql.transaction_registry Table

1. PARTITION BY SYSTEM_TIME is not supported for transaction-precise system-versioned tables. Attempting

The `mysql.transaction_registry` table is part of system-versioned tables. It is used for transaction-precise versioning, and contains the following fields:

Field	Type	Null	Key	Default	Description
transaction_id	bigint(20) unsigned	NO	Primary	NULL	
commit_id	bigint(20) unsigned	NO	Unique	NULL	
begin_timestamp	timestamp(6)	NO	Multiple	0000-00-00 00:00:00.000000	Timestamp when the transaction began (BEGIN statement), however see MDEV-16024.
commit	timestamp(6)	NO	Multiple	0000-00-00 00:00:00.000000	Timestamp when the transaction was committed.
isolation_level	enum('READ-UNCOMMITTED','READ-COMMITTED','REPEATABLE-READ','SERIALIZABLE')	NO		NULL	Transaction isolation level.

This page is licensed: CC BY-SA / Gnu FDL

mysql.user Table

1. PARTITION BY SYSTEM_TIME is not supported for transaction-precise system-versioned tables. Attempting

The mysql.global_priv table has replaced the `mysql.user` table, and `mysql.user` should be considered obsolete. It is now a view into `mysql.global_priv` created for compatibility with older applications and monitoring scripts. New

tools are supposed to use `INFORMATION_SCHEMA` tables. The dedicated `mariadb.sys` user is created as the definer of the view. Previously, `root` was the definer, which resulted in privilege problems when this username was changed (MDEV-19650).

The `mysql.user` table contains information about users that have permission to access the MariaDB server, and their global privileges. The table can be queried and although it is possible to directly update it, it is best to use GRANT and CREATE USER for adding users and privileges.

Note that the MariaDB privileges occur at many levels. A user may not be granted `create` privilege at the user level, but may still have `create` permission on certain tables or databases, for example. See privileges for a more complete view of the MariaDB privilege system.

The `mysql.user` table contains the following fields:

Field	Type	Null	Key	Default	Description
Host	char(60)	NO	PRI		Host (together with User makes up the unique identifier for this account.
User	char(80)	NO	PRI		User (together with Host makes up the unique identifier for this account.
Password	longtext	NO			Hashed password, generated by the PASSWORD() function.
Select_priv	enum('N','Y')	NO		N	Can perform SELECT statements.
Insert_priv	enum('N','Y')	NO		N	Can perform INSERT statements.
Update_priv	enum('N','Y')	NO		N	Can perform UPDATE statements.
Delete_priv	enum('N','Y')	NO		N	Can perform DELETE statements.
Create_priv	enum('N','Y')	NO		N	Can CREATE DATABASE's or CREATE TABLE's.
Drop_priv	enum('N','Y')	NO		N	Can DROP DATABASE's or DROP TABLE's.
Reload_priv	enum('N','Y')	NO		N	Can execute FLUSH statements or equivalent mariadb-admin commands.
Shutdown_priv	enum('N','Y')	NO		N	Can shut down the server with SHUTDOWN or mariadb-admin shutdown.
Process_priv	enum('N','Y')	NO		N	Can show information about active processes, via SHOW PROCESSLIST or mariadb-admin processlist.

Field	Type	Null	Key	Default	Description
File_priv	enum('N','Y')	NO		N	Read and write files on the server, using statements like LOAD DATA INFILE or functions like LOAD_FILE(). Also needed to create CONNECT outward tables. MariaDB server must have permission to access those files.
Grant_priv	enum('N','Y')	NO		N	User can grant privileges they possess.
References_priv	enum('N','Y')	NO		N	Unused
Index_priv	enum('N','Y')	NO		N	Can create an index on a table using the CREATE INDEX statement. Without the INDEX privilege, user can still create indexes when creating a table using the CREATE TABLE statement if the user has have the CREATE privilege, and user can create indexes using the ALTER TABLE statement if they have the ALTER privilege.
Alter_priv	enum('N','Y')	NO		N	Can perform ALTER TABLE statements.
Show_db_priv	enum('N','Y')	NO		N	Can list all databases using the SHOW DATABASES statement. Without the SHOW DATABASES privilege, user can still issue the SHOW DATABASES statement, but it will only list databases containing tables on which they have privileges.
Super_priv	enum('N','Y')	NO		N	Can execute superuser statements: CHANGE MASTER TO, KILL (users who do not have this privilege can only KILL their own threads), PURGE LOGS, SET global system variables, or the mariadb-admin debug command. Also, this permission allows the user to write data even if the read_only startup option is set, enable or disable logging, enable or disable replication on slaves, specify a DEFINER for statements that support that clause, connect once after reaching the MAX_CONNECTIONS. If a statement has been specified for the init-connect mysqld option, that command will not be executed when a user with SUPER privileges connects to the server.
Create_tmp_table_priv	enum('N','Y')	NO		N	Can create temporary tables with the CREATE TEMPORARY TABLE statement.
Lock_tables_priv	enum('N','Y')	NO		N	Acquire explicit locks using the LOCK TABLES statement; user also needs to have the SELECT privilege on a table in order to lock it.
Execute_priv	enum('N','Y')	NO		N	Can execute stored procedure or functions.
Repl_slave_priv	enum('N','Y')	NO		N	Accounts used by slave servers on the master need this privilege. This is needed to get the updates made on the master.
Repl_client_priv	enum('N','Y')	NO		N	Can execute SHOW MASTER STATUS and SHOW SLAVE STATUS statements.
Create_view_priv	enum('N','Y')	NO		N	Can create a view using the CREATE_VIEW statement.

Field	Type	Null	Key	Default	Description
Show_view_priv	enum('N','Y')	NO		N	Can show the CREATE VIEW statement to create a view using the SHOW CREATE VIEW statement.
Create_routine_priv	enum('N','Y')	NO		N	Can create stored programs using the CREATE PROCEDURE and CREATE FUNCTION statements.
Alter_routine_priv	enum('N','Y')	NO		N	Can change the characteristics of a stored function using the ALTER FUNCTION statement.
Create_user_priv	enum('N','Y')	NO		N	Can create a user using the CREATE USER statement, or implicitly create a user with the GRANT statement.
Event_priv	enum('N','Y')	NO		N	Create, drop and alter events.
Trigger_priv	enum('N','Y')	NO		N	Can execute triggers associated with tables the user updates, execute the CREATE TRIGGER and DROP TRIGGER statements.
Create_tablespace_priv	enum('N','Y')	NO		N	
Delete_history_priv	enum('N','Y')	NO		N	Can delete rows created through system versioning.
ssl_type	enum('', 'ANY', 'X509', 'SPECIFIED')	NO			TLS type - see TLS options.
ssl_cipher	blob	NO		NULL	TLS cipher - see TLS options.
x509_issuer	blob	NO		NULL	X509 cipher - see TLS options.
x509_subject	blob	NO		NULL	SSL subject - see TLS options.
max_questions	int(11) unsigned	NO		0	Number of queries the user can perform per hour. Zero is unlimited. See per-account resource limits.

Field	Type	Null	Key	Default	Description
max_updates	int(11) unsigned	NO		0	Number of updates the user can perform per hour. Zero is unlimited. See per-account resource limits.
max_connections	int(11) unsigned	NO		0	Number of connections the account can start per hour. Zero is unlimited. See per-account resource limits.
max_user_connections	int(11)	NO		0	Number of simultaneous connections the account can have. Zero is unlimited. See per-account resource limits.
plugin	char(64)	NO			Authentication plugin used on connection. If empty, uses the default.
authentication_string	text	NO		NULL	Authentication string for the authentication plugin.
password_expired	enum('N','Y')	NO		N	MySQL-compatibility option, not implemented in MariaDB.
is_role	enum('N','Y')	NO		N	Whether the user is a role.
default_role	char(80)	NO		N	Role which will be enabled on user login automatically.
max_statement_time	decimal(12,6)	NO		0.000000	If non-zero, how long queries can run before being killed automatically.
Field	Type	Null	Key	Default	Description

The Acl_roles status variable indicates how many rows the `mysql.user` table contains where `is_role='Y'`.

The Acl_users status variable, indicates how many rows the `mysql.user` table contains where `is_role='N'`.

Authentication Plugin

When the `plugin` column is empty, MariaDB defaults to authenticating accounts with either the mysql_native_password or the mysql_old_password plugins. It decides which based on the hash used in the value for the `Password` column. When there's no password set or when the 4.1 password hash is used, (which is 41 characters long), MariaDB uses the mysql_native_password plugin. The mysql_old_password plugin is used with pre-4.1 password hashes, (which are 16 characters long).

MariaDB also supports the use of alternative authentication plugins. When the `plugin` column is not empty for the given account, MariaDB uses it to authenticate connection attempts. The specific plugin then uses the value of either the `Password` column or the `authentication_string` column to authenticate the user.

A specific authentication plugin can be used for an account by providing the `IDENTIFIED VIA authentication_plugin` clause with the CREATE USER, ALTER USER, or GRANT statements.

For example, the following statement would create an account that authenticates with the PAM authentication plugin:

```
CREATE USER foo2@test IDENTIFIED VIA pam;
```

If the specific authentication plugin uses the `authentication_string` column, then this value for the account can be specified after a `USING` or `AS` keyword. For example, the PAM authentication plugin accepts a service name that would go into the `authentication_string` column for the account:

```
CREATE USER foo2@test IDENTIFIED VIA pam USING 'mariadb';
```

Spider mysql Database Tables

See mysql.spider_link_failed_log Table.

This table logs failures when attempting to establish connections to remote Spider links, helping to diagnose network or configuration issues.

See mysql.spider_link_mon_servers Table.

This table defines the remote servers used for link monitoring in the Spider storage engine, ensuring high availability and failover handling.

See mysql.spider_table_crd Table.

The mysql.spider_table_crd table stores cardinality statistics for Spider tables, which the optimizer uses to create efficient query plans.

See mysql.spider_table_position_for_recovery Table.

This table records XA transaction positions for Spider tables, essential for recovering distributed transactions after a crash.

See mysql.spider_table_sts Table.

The mysql.spider_table_sts table holds statistics such as row counts and data length for Spider tables, supporting the optimizer.

See mysql.spider_tables Table.

This table stores specific parameters and metadata for Spider tables, defining how they map to remote backend tables.

See mysql.spider_xa Table.

The mysql.spider_xa table tracks the status of XA transactions involving Spider tables, ensuring atomicity across distributed nodes.

See mysql.spider_xa_failed_log Table.

This table logs details of failed XA transactions in the Spider storage engine, providing a record for troubleshooting distributed transaction errors.

See mysql.spider_xa_member Table.

The mysql.spider_xa_member table lists the member nodes participating in a distributed XA transaction managed by the Spider engine.

mysql.spider_link_failed_log Table

The `mysql.spider_link_failed_log` table is installed by the Spider storage engine.

This table uses the Aria storage engine.

It contains the following fields:

Field	Type	Null	Key	Default	Description
db_name	char(64)	NO			
table_name	char(199)	NO			
link_id	char(64)	NO			
failed_time	timestamp	NO		current_timestamp()	

This page is licensed: CC BY-SA / Gnu FDL

mysql.spider_link_mon_servers Table

The `mysql.spider_link_mon_servers` table is installed by the Spider storage engine.

This table uses the Aria storage engine.

It contains the following fields:

Field	Type	Null	Key	Default	Description
db_name	char(64)	NO	PRI		
table_name	char(199)	NO	PRI		
link_id	char(64)	NO	PRI		
sid	int(10) unsigned	NO	PRI	0

mysql.spider_xa_member Table

The `mysql.spider_xa_member` table is installed by the Spider storage engine.

This table uses the Aria storage engine.

It contains the following fields:

Field	Type	Null	Key	Default	Description
format_id	int(11)	NO		0	
gtrid_length	int(11)	NO		0	
bqual_length	int(11)	NO		0	
data	binary(128)	NO	MUL		
scheme	char(64)	NO			
host	char(64)	NO			
port	char(5)	NO			
socket	text	NO		NULL	
username	char(64)	NO			
password	char(64)	NO			
ssl_ca	text	YES		NULL	
ssl_capath	text	YES		NULL	
ssl_cert	text	YES		NULL	
ssl_cipher	char(64)	YES		NULL	
ssl_key	text	YES		NULL	
ssl_verify_server_cert	tinyint(4)	NO		0	
default_file	text	YES		NULL	
default_group	char(64)	YES		NULL	
dsn	char(64)	YES		NULL	
filedsn	text	YES		NULL	
driver	char(64)	YES		NULL

Error Codes

See MariaDB Error Code Reference.

An overview of MariaDB error codes, including those shared with MySQL and those specific to MariaDB, with their symbolic names and messages.

See Operating System Error Codes.

Common Linux and Windows operating-system error codes MariaDB may report, and how to look them up with the perror tool.

See MariaDB Error Codes 1000 to 1099.

MariaDB server error codes 1000 to 1099, each with its symbolic name and message.

See MariaDB Error Codes 1100 to 1199.

MariaDB server error codes 1100 to 1199, each with its symbolic name and message.

See MariaDB Error Codes 1200 to 1299.

MariaDB server error codes 1200 to 1299, each with its symbolic name and message.

See MariaDB Error Codes 1300 to 1399.

MariaDB server error codes 1300 to 1399, each with its symbolic name and message.

See MariaDB Error Codes 1400 to 1499.

MariaDB server error codes 1400 to 1499, each with its symbolic name and message.

See MariaDB Error Codes 1500 to 1599.

MariaDB server error codes 1500 to 1599, each with its symbolic name and message.

See MariaDB Error Codes 1600 to 1699.

MariaDB server error codes 1600 to 1699, each with its symbolic name and message.

See MariaDB Error Codes 1700 to 1799.

MariaDB server error codes 1700 to 1799, each with its symbolic name and message.

See MariaDB Error Codes 1800 to 1899.

MariaDB server error codes 1800 to 1899, each with its symbolic name and message.

See MariaDB Error Codes 1900 to 1999.

MariaDB server error codes 1900 to 1999, each with its symbolic name and message.

See MariaDB Error Codes 3000 to 3099.

MariaDB server error codes 3000 to 3099, each with its symbolic name and message.

See MariaDB Error Codes 4000 to 4099.

MariaDB server error codes 4000 to 4099, each with its symbolic name and message.

See MariaDB Error Codes 4100 to 4199.

MariaDB server error codes 4100 to 4199, each with its symbolic name and message.

See MariaDB Error Codes 4200 to 4299.

MariaDB server error codes 4200 to 4299, each with its symbolic name and message.

MariaDB Error Code Reference

> **Warning:**
>
> Error codes from 4195 onward have been shifted!

MariaDB shares error codes with MySQL. There are also a number of error codes specific to MariaDB.

An example of an error code:

```
SELECT * FROM x;
ERROR 1046 (3D000): No database selected
```

There are three pieces of information returned in an error:

- A numeric error code, in this case `1046`. Error codes from `1900` and up are specific to MariaDB, while error codes from `1000` to 1800 are shared by MySQL and MariaDB.
- An SQLSTATE value, consisting of five characters, in this case `3D000`. These codes are standard to ODBC and ANSI SQL. When MariaDB cannot allocate a standard `SQLSTATE` code, a generic `HY000`, or general error, is used.
- A string describing the error, in this case `No database selected`.

New error codes are being continually being added as new features are added. For a definitive list, see the file `sql/share/errmsg-utf8.txt`, as well as `include/mysqld_error.h` in the build directory, generated by the `comp_err` tool. The perror tool can be used to get the error message associated with a given error code.

Shared MariaDB/MySQL Error Codes

Error Code	SQLSTATE	Error	Description
1000	HY000	ER_HASHCHK	hashchk
1001	HY000	ER_NISAMCHK	isamchk
1002	HY000	ER_NO	NO
1003	HY000	ER_YES	YES
1004	HY000	ER_CANT_CREATE_FILE	Can’t create file ‘%s’ (errno: %d)
1005	HY000	ER_CANT_CREATE_TABLE	Can’t create table ‘%s’ (errno: %d)
1006	HY000	ER_CANT_CREATE_DB	Can’t create database ‘%s’ (errno: %d)
1007	HY000	ER_DB_CREATE_EXISTS	Can’t create database ‘%s’; database exists
1008	HY000	ER_DB_DROP_EXISTS	Can’t drop database ‘%s’; database doesn’t exist
1009	HY000	ER_DB_DROP_DELETE	Error dropping database (can’t delete ‘%s’, errno: %d)

Error Code	SQLSTATE	Error	Description
1010	HY000	ER_DB_DROP_RMDIR	Error dropping database (can't rmdir '%s', errno: %d)
1011	HY000	ER_CANT_DELETE_FILE	Error on delete of '%s' (errno: %d)
1012	HY000	ER_CANT_FIND_SYSTEM_REC	Can't read record in system table
1013	HY000	ER_CANT_GET_STAT	Can't get status of '%s' (errno: %d)
1014	HY000	ER_CANT_GET_WD	Can't get working directory (errno: %d)
1015	HY000	ER_CANT_LOCK	Can't lock file (errno: %d)
1016	HY000	ER_CANT_OPEN_FILE	Can't open file: '%s' (errno: %d)
1017	HY000	ER_FILE_NOT_FOUND	Can't find file: '%s' (errno: %d)
1018	HY000	ER_CANT_READ_DIR	Can't read dir of '%s' (errno: %d)
1019	HY000	ER_CANT_SET_WD	Can't change dir to '%s' (errno: %d)
1020	HY000	ER_CHECKREAD	Record has changed since last read in table '%s'
1021	HY000	ER_DISK_FULL	Disk full (%s); waiting for someone to free some space…
1022	23000	ER_DUP_KEY	Can't write; duplicate key in table '%s'
1023	HY000	ER_ERROR_ON_CLOSE	Error on close of '%s' (errno: %d)
1024	HY000	ER_ERROR_ON_READ	Error reading file '%s' (errno: %d)
1025	HY000	ER_ERROR_ON_RENAME	Error on rename of '%s' to '%s' (errno: %d)
1026	HY000	ER_ERROR_ON_WRITE	Error writing file '%s' (errno: %d)
1027	HY000	ER_FILE_USED	'%s' is locked against change
1028	HY000	ER_FILSORT_ABORT	Sort aborted
1029	HY000	ER_FORM_NOT_FOUND	View '%s' doesn't exist for '%s'
1030	HY000	ER_GET_ERRN	Got error %d from storage engine
1031	HY000	ER_ILLEGAL_HA	Table storage engine for '%s' doesn't have this option
1032	HY000	ER_KEY_NOT_FOUND	Can't find record in '%s'
1033	HY000	ER_NOT_FORM_FILE	Incorrect information in file: '%s'

Error Code	SQLSTATE	Error	Description
1034	HY000	ER_NOT_KEYFILE	Incorrect key file for table ‘%s’; try to repair it
1035	HY000	ER_OLD_KEYFILE	Old key file for table ‘%s’; repair it!
1036	HY000	ER_OPEN_AS_READONLY	Table ‘%s’ is read only
1037	HY001	ER_OUTOFMEMORY	Out of memory; restart server and try again (needed %d bytes)
1038	HY001	ER_OUT_OF_SORTMEMORY	Out of sort memory, consider increasing server sort buffer size
1039	HY000	ER_UNEXPECTED_EOF	Unexpected EOF found when reading file ‘%s’ (Errno: %d)
1040	08004	ER_CON_COUNT_ERROR	Too many connections
1041	HY000	ER_OUT_OF_RESOURCES	Out of memory; check if mysqld or some other process uses all available memory; if not, you may have to use ‘ulimit’ to allow mysqld to use more memory or you can add more swap space
1042	08S01	ER_BAD_HOST_ERROR	Can’t get hostname for your address
1043	08S01	ER_HANDSHAKE_ERROR	Bad handshake
1044	42000	ER_DBACCESS_DENIED_ERROR	Access denied for user ‘%s’@‘%s’ to database ‘%s’
1045	28000	ER_ACCESS_DENIED_ERROR	Access denied for user ‘%s’@‘%s’ (using password: %s)
1046	3D000	ER_NO_DB_ERROR	No database selected
1047	08S01	ER_UNKNOWN_COM_ERROR	Unknown command
1048	23000	ER_BAD_NULL_ERROR	Column ‘%s’ cannot be null
1049	42000	ER_BAD_DB_ERROR	Unknown database ‘%s’
1050	42S01	ER_TABLE_EXISTS_ERROR	Table ‘%s’ already exists
1051	42S02	ER_BAD_TABLE_ERROR	Unknown table ‘%s’
1052	23000	ER_NON_UNIQ_ERROR	Column ‘%s’ in %s is ambiguous
1053	08S01	ER_SERVER_SHUTDOWN	Server shutdown in progress
1054	42S22	ER_BAD_FIELD_ERROR	Unknown column ‘%s’ in ‘%s’
1055	42000	ER_WRONG_FIELD_WITH_GROUP	‘%s’ isn’t in GROUP BY
1056	42000	ER_WRONG_GROUP_FIELD	Can’t group on ‘%s’
1057	42000	ER_WRONG_SUM_SELECT	Statement has sum functions and columns in same statement

Error Code	SQLSTATE	Error	Description
1058	21S01	ER_WRONG_VALUE_COUNT	Column count doesn't match value count
1059	42000	ER_TOO_LONG_IDENT	Identifier name '%s' is too long
1060	42S21	ER_DUP_FIELDNAME	Duplicate column name '%s'
1061	42000	ER_DUP_KEYNAME	Duplicate key name '%s'
1062	23000	ER_DUP_ENTRY	Duplicate entry '%s' for key %d
1063	42000	ER_WRONG_FIELD_SPEC	Incorrect column specifier for column '%s'
1064	42000	ER_PARSE_ERROR	%s near '%s' at line %d
1065	42000	ER_EMPTY_QUERY	Query was empty
1066	42000	ER_NONUNIQ_TABLE	Not unique table/alias: '%s'
1067	42000	ER_INVALID_DEFAULT	Invalid default value for '%s'
1068	42000	ER_MULTIPLE_PRI_KEY	Multiple primary key defined
1069	42000	ER_TOO_MANY_KEYS	Too many keys specified; max %d keys allowed
1070	42000	ER_TOO_MANY_KEY_PARTS	Too many key parts specified; max %d parts allowed
1071	42000	ER_TOO_LONG_KEY	Specified key was too long; max key length is %d bytes
1072	42000	ER_KEY_COLUMN_DOES_NOT_EXITS	Key column '%s' doesn't exist in table
1073	42000	ER_BLOB_USED_AS_KEY	BLOB column '%s' can't be used in key specification with the used table type
1074	42000	ER_TOO_BIG_FIELDLENGTH	Column length too big for column '%s' (max = %lu); use BLOB or TEXT instead
1075	42000	ER_WRONG_AUTO_KEY	Incorrect table definition; there can be only one auto column and it must be defined as a key
1076	HY000	ER_READY	%s: ready for connections. Version: '%s' socket: '%s' port: %d
1077	HY000	ER_NORMAL_SHUTDOWN	%s: Normal shutdown
1078	HY000	ER_GOT_SIGNAL	%s: Got signal %d. Aborting!
1079	HY000	ER_SHUTDOWN_COMPLETE	%s: Shutdown complete
1080	08S01	ER_FORCING_CLOSE	%s: Forcing close of thread %ld user: '%s'
1081	08S01	ER_IPSOCK_ERROR	Can't create IP socket
1082	42S12	ER_NO_SUCH_INDEX	Table '%s' has no index like the one used in CREATE INDEX; recreate the table

Error Code	SQLSTATE	Error	Description
1083	42000	ER_WRONG_FIELD_TERMINATORS	Field separator argument is not what is expected; check the manual
1084	42000	ER_BLOBS_AND_NO_TERMINATED	You can't use fixed rowlength with BLOBs; please use 'fields terminated by'
1085	HY000	ER_TEXTFILE_NOT_READABLE	The file '%s' must be in the database directory or be readable by all
1086	HY000	ER_FILE_EXISTS_ERROR	File '%s' already exists
1087	HY000	ER_LOAD_INF	Records: %ld Deleted: %ld Skipped: %ld Warnings: %ld
1088	HY000	ER_ALTER_INF	Records: %ld Duplicates: %ld
1089	HY000	ER_WRONG_SUB_KEY	Incorrect prefix key; the used key part isn't a string, the used length is longer than the key part, or the storage engine doesn't support unique prefix keys
1090	42000	ER_CANT_REMOVE_ALL_FIELDS	You can't delete all columns with ALTER TABLE; use DROP TABLE instead
1091	42000	ER_CANT_DROP_FIELD_OR_KEY	Can't DROP '%s'; check that column/key exists
1092	HY000	ER_INSERT_INF	Records: %ld Duplicates: %ld Warnings: %ld
1093	HY000	ER_UPDATE_TABLE_USED	You can't specify target table '%s' for update in FROM clause
1094	HY000	ER_NO_SUCH_THREAD	Unknown thread id: %lu
1095	HY000	ER_KILL_DENIED_ERROR	You are not owner of thread %lu
1096	HY000	ER_NO_TABLES_USED	No tables used
1097	HY000	ER_TOO_BIG_SET	Too many strings for column %s and SET
1098	HY000	ER_NO_UNIQUE_LOGFILE	Can't generate a unique log-filename %s.(1-999)
1099	HY000	ER_TABLE_NOT_LOCKED_FOR_WRITE	Table '%s' was locked with a READ lock and can't be updated

Error Code	SQLSTATE	Error	Description
1100	HY000	ER_TABLE_NOT_LOCKED	Table '%s' was not locked with LOCK TABLES
1101		ER_UNUSED_17	You should never see it
1102	42000	ER_WRONG_DB_NAME	Incorrect database name '%s'
1103	42000	ER_WRONG_TABLE_NAME	Incorrect table name '%s'
1104	42000	ER_TOO_BIG_SELECT	The SELECT would examine more than MAX_JOIN_SIZE rows; check your WHERE and use SET SQL_BIG_SELECTS=1 or SET MAX_JOIN_SIZE= ## if the SELECT is okay
1105	HY000	ER_UNKNOWN_ERROR	Unknown error

Error Code	SQLSTATE	Error	Description
1106	42000	ER_UNKNOWN_PROCEDURE	Unknown procedure '%s'
1107	42000	ER_WRONG_PARAMCOUNT_TO_PROCEDURE	Incorrect parameter count to procedure '%s'
1108	HY000	ER_WRONG_PARAMETERS_TO_PROCEDURE	Incorrect parameters to procedure '%s'
1109	42S02	ER_UNKNOWN_TABLE	Unknown table '%s' in %s
1110	42000	ER_FIELD_SPECIFIED_TWICE	Column '%s' specified twice
1111	HY000	ER_INVALID_GROUP_FUNC_USE	Invalid use of group function
1112	42000	ER_UNSUPPORTED_EXTENSION	Table '%s' uses an extension that doesn't exist in this MariaDB version
1113	42000	ER_TABLE_MUST_HAVE_COLUMNS	A table must have at least 1 column
1114	HY000	ER_RECORD_FILE_FULL	The table '%s' is full
1115	42000	ER_UNKNOWN_CHARACTER_SET	Unknown character set: '%s'
1116	HY000	ER_TOO_MANY_TABLES	Too many tables; MariaDB can only use %d tables in a join
1117	HY000	ER_TOO_MANY_FIELDS	Too many columns
1118	42000	ER_TOO_BIG_ROWSIZE	Row size too large. The maximum row size for the used table type, not counting BLOBs, is %ld. You have to change some columns to TEXT or BLOBs
1119	HY000	ER_STACK_OVERRUN	Thread stack overrun: Used: %ld of a %ld stack. Use 'mysqld –thread_stack=#' to specify a bigger stack if needed
1120	42000	ER_WRONG_OUTER_JOIN	Cross dependency found in OUTER JOIN; examine your ON conditions
1121	42000	ER_NULL_COLUMN_IN_INDEX	Table handler doesn't support NULL in given index. Please change column '%s' to be NOT NULL or use another handler
1122	HY000	ER_CANT_FIND_UDF	Can't load function '%s'
1123	HY000	ER_CANT_INITIALIZE_UDF	Can't initialize function '%s'; %s
1124	HY000	ER_UDF_NO_PATHS	No paths allowed for shared library
1125	HY000	ER_UDF_EXISTS	Function '%s' already exists
1126	HY000	ER_CANT_OPEN_LIBRARY	Can't open shared library '%s' (Errno: %d %s)
1127	HY000	ER_CANT_FIND_DL_ENTRY	Can't find symbol '%s' in library
1128	HY000	ER_FUNCTION_NOT_DEFINED	Function '%s' is not defined
1129	HY000	ER_HOST_IS_BLOCKED	Host '%s' is blocked because of many connection errors; unblock with 'mysqladmin flush-hosts'

Error Code	SQLSTATE	Error	Description
1130	HY000	ER_HOST_NOT_PRIVILEGED	Host ‘%s’ is not allowed to connect to this MariaDB server
1131	42000	ER_PASSWORD_ANONYMOUS_USER	You are using MariaDB as an anonymous user and anonymous users are not allowed to change passwords
1132	42000	ER_PASSWORD_NOT_ALLOWED	You must have privileges to update tables in the mysql database to be able to change passwords for others
1133	42000	ER_PASSWORD_NO_MATCH	Can’t find any matching row in the user table
1134	HY000	ER_UPDATE_INF	Rows matched: %ld Changed: %ld Warnings: %ld
1135	HY000	ER_CANT_CREATE_THREAD	Can’t create a new thread (Errno %d); if you are not out of available memory, you can consult the manual for a possible OS-dependent bug
1136	21S01	ER_WRONG_VALUE_COUNT_ON_ROW	Column count doesn’t match value count at row %ld
1137	HY000	ER_CANT_REOPEN_TABLE	Can’t reopen table: ‘%s’
1138	22004	ER_INVALID_USE_OF_NULL	Invalid use of NULL value
1139	42000	ER_REGEXP_ERROR	Got error ‘%s’ from regexp
1140	42000	ER_MIX_OF_GROUP_FUNC_AND_FIELDS	Mixing of GROUP columns (MIN(),MAX(),COUNT(),…) with no GROUP columns is illegal if there is no GROUP BY clause
1141	42000	ER_NONEXISTING_GRANT	There is no such grant defined for user ‘%s’ on host ‘%s’
1142	42000	ER_TABLEACCESS_DENIED_ERROR	%s command denied to user ‘%s’@‘%s’ for table ‘%s’
1143	42000	ER_COLUMNACCESS_DENIED_ERROR	%s command denied to user ‘%s’@‘%s’ for column ‘%s’ in table ‘%s’
1144	42000	ER_ILLEGAL_GRANT_FOR_TABLE	Illegal GRANT/REVOKE command; please consult the manual to see which privileges can be used
1145	42000	ER_GRANT_WRONG_HOST_OR_USER	The host or user argument to GRANT is too long
1146	42S02	ER_NO_SUCH_TABLE	Table ‘%s.%s’ doesn’t exist
1147	42000	ER_NONEXISTING_TABLE_GRANT	There is no such grant defined for user ‘%s’ on host ‘%s’ on table ‘%s’
1148	42000	ER_NOT_ALLOWED_COMMAND	The used command is not allowed with this MariaDB version
1149	42000	ER_SYNTAX_ERROR	You have an error in your SQL syntax; check the manual that corresponds to your MariaDB server version for the right syntax to use
1150	HY000	ER_DELAYED_CANT_CHANGE_LOCK	Delayed insert thread couldn’t get requested lock for table %s
1151	HY000	ER_TOO_MANY_DELAYED_THREADS	Too many delayed threads in use
1152	08S01	ER_ABORTING_CONNECTION	Aborted connection %ld to db: ‘%s’ user: ‘%s’ (%s)
1153	08S01	ER_NET_PACKET_TOO_LARGE	Got a packet bigger than ‘max_allowed_packet’ bytes

Error Code	SQLSTATE	Error	Description
1154	08S01	ER_NET_READ_ERROR_FROM_PIPE	Got a read error from the connection pipe
1155	08S01	ER_NET_FCNTL_ERROR	Got an error from fcntl()
1156	08S01	ER_NET_PACKETS_OUT_OF_ORDER	Got packets out of order
1157	08S01	ER_NET_UNCOMPRESS_ERROR	Couldn't uncompress communication packet
1158	08S01	ER_NET_READ_ERROR	Got an error reading communication packets
1159	08S01	ER_NET_READ_INTERRUPTED	Got timeout reading communication packets
1160	08S01	ER_NET_ERROR_ON_WRITE	Got an error writing communication packets
1161	08S01	ER_NET_WRITE_INTERRUPTED	Got timeout writing communication packets
1162	42000	ER_TOO_LONG_STRING	Result string is longer than 'max_allowed_packet' bytes
1163	42000	ER_TABLE_CANT_HANDLE_BLOB	The used table type doesn't support BLOB/TEXT columns
1164	42000	ER_TABLE_CANT_HANDLE_AUTO_INCREMENT	The used table type doesn't support AUTO_INCREMENT columns
1165	HY000	ER_DELAYED_INSERT_TABLE_LOCKED	INSERT DELAYED can't be used with table '%s' because it is locked with LOCK TABLES
1166	42000	ER_WRONG_COLUMN_NAME	Incorrect column name '%s'
1167	42000	ER_WRONG_KEY_COLUMN	The used storage engine can't index column '%s'
1168	HY000	ER_WRONG_MRG_TABLE	Unable to open underlying table which is differently defined or of non-MyISAM type or doesn't exist
1169	23000	ER_DUP_UNIQUE	Can't write, because of unique constraint, to table '%s'
1170	42000	ER_BLOB_KEY_WITHOUT_LENGTH	BLOB/TEXT column '%s' used in key specification without a key length
1171	42000	ER_PRIMARY_CANT_HAVE_NULL	All parts of a PRIMARY KEY must be NOT NULL; if you need NULL in a key, use UNIQUE instead
1172	42000	ER_TOO_MANY_ROWS	Result consisted of more than one row
1173	42000	ER_REQUIRES_PRIMARY_KEY	This table type requires a primary key
1174	HY000	ER_NO_RAID_COMPILED	This version of MariaDB is not compiled with RAID support
1175	HY000	ER_UPDATE_WITHOUT_KEY_IN_SAFE_MODE	You are using safe update mode and you tried to update a table without a WHERE that uses a KEY column
1176	42000	ER_KEY_DOES_NOT_EXITS	Key '%s' doesn't exist in table '%s'
1177	42000	ER_CHECK_NO_SUCH_TABLE	Can't open table
1178	42000	ER_CHECK_NOT_IMPLEMENTED	The storage engine for the table doesn't support %s

Error Code	SQLSTATE	Error	Description
1179	25000	ER_CANT_DO_THIS_DURING_AN_TRANSACTION	You are not allowed to execute this command in a transaction
1180	HY000	ER_ERROR_DURING_COMMIT	Got error %d during COMMIT
1181	HY000	ER_ERROR_DURING_ROLLBACK	Got error %d during ROLLBACK
1182	HY000	ER_ERROR_DURING_FLUSH_LOGS	Got error %d during FLUSH_LOGS
1183	HY000	ER_ERROR_DURING_CHECKPOINT	Got error %d during CHECKPOINT
1184	08S01	ER_NEW_ABORTING_CONNECTION	Aborted connection %ld to db: '%s' user: '%s' host: '%s' (%s)
1185		ER_UNUSED_10	You should never see it
1186	HY000	ER_FLUSH_MASTER_BINLOG_CLOSED	Binlog closed, cannot RESET MASTER
1187	HY000	ER_INDEX_REBUILD	Failed rebuilding the index of dumped table '%s'
1188	HY000	ER_MASTER	Error from master: '%s'
1189	08S01	ER_MASTER_NET_READ	Net error reading from master
1190	08S01	ER_MASTER_NET_WRITE	Net error writing to master
1191	HY000	ER_FT_MATCHING_KEY_NOT_FOUND	Can't find FULLTEXT index matching the column list
1192	HY000	ER_LOCK_OR_ACTIVE_TRANSACTION	Can't execute the given command because you have active locked tables or an active transaction
1193	HY000	ER_UNKNOWN_SYSTEM_VARIABLE	Unknown system variable '%s'
1194	HY000	ER_CRASHED_ON_USAGE	Table '%s' is marked as crashed and should be repaired
1195	HY000	ER_CRASHED_ON_REPAIR	Table '%s' is marked as crashed and last (automatic?) repair failed
1196	HY000	ER_WARNING_NOT_COMPLETE_ROLLBACK	Some non-transactional changed tables couldn't be rolled back
1197	HY000	ER_TRANS_CACHE_FULL	Multi-statement transaction required more than 'max_binlog_cache_size' bytes of storage; increase this mysqld variable and try again
1198	HY000	ER_SLAVE_MUST_STOP	This operation cannot be performed with a running slave; run STOP SLAVE first
1199	HY000	ER_SLAVE_NOT_RUNNING	This operation requires a running slave; configure slave and do START SLAVE

Error Code	SQLSTATE	Error	Description
1200	HY000	ER_BAD_SLAVE	The server is not configured as slave; fix in config file or with CHANGE MASTER TO
1201	HY000	ER_MASTER_INFO	Could not initialize master info structure; more error messages can be found in the MariaDB error log

Error Code	SQLSTATE	Error	Description
1202	HY000	ER_SLAVE_THREAD	Could not create slave thread; check system resources
1203	42000	ER_TOO_MANY_USER_CONNECTIONS	User %s already has more than 'max_user_connections' active connections
1204	HY000	ER_SET_CONSTANTS_ONLY	You may only use constant expressions with SET
1205	HY000	ER_LOCK_WAIT_TIMEOUT	Lock wait timeout exceeded; try restarting transaction
1206	HY000	ER_LOCK_TABLE_FULL	The total number of locks exceeds the lock table size
1207	25000	ER_READ_ONLY_TRANSACTION	Update locks cannot be acquired during a READ UNCOMMITTED transaction
1208	HY000	ER_DROP_DB_WITH_READ_LOCK	DROP DATABASE not allowed while thread is holding global read lock
1209	HY000	ER_CREATE_DB_WITH_READ_LOCK	CREATE DATABASE not allowed while thread is holding global read lock
1210	HY000	ER_WRONG_ARGUMENTS	Incorrect arguments to %s
1211	42000	ER_NO_PERMISSION_TO_CREATE_USER	'%s'@'%s' is not allowed to create new users
1212	HY000	ER_UNION_TABLES_IN_DIFFERENT_DIR	Incorrect table definition; all MERGE tables must be in the same database
1213	40001	ER_LOCK_DEADLOCK	Deadlock found when trying to get lock; try restarting transaction
1214	HY000	ER_TABLE_CANT_HANDLE_FT	The used table type doesn't support FULLTEXT indexes
1215	HY000	ER_CANNOT_ADD_FOREIGN	Cannot add foreign key constraint
1216	23000	ER_NO_REFERENCED_ROW	Cannot add or update a child row: a foreign key constraint fails
1217	23000	ER_ROW_IS_REFERENCED	Cannot delete or update a parent row: a foreign key constraint fails
1218	08S01	ER_CONNECT_TO_MASTER	Error connecting to master: %s
1219	HY000	ER_QUERY_ON_MASTER	Error running query on master: %s
1220	HY000	ER_ERROR_WHEN_EXECUTING_COMMAND	Error when executing command %s: %s
1221	HY000	ER_WRONG_USAGE	Incorrect usage of %s and %s
1222	21000	ER_WRONG_NUMBER_OF_COLUMNS_IN_SELECT	The used SELECT statements have a different number of columns
1223	HY000	ER_CANT_UPDATE_WITH_READLOCK	Can't execute the query because you have a conflicting read lock
1224	HY000	ER_MIXING_NOT_ALLOWED	Mixing of transactional and non-transactional tables is disabled
1225	HY000	ER_DUP_ARGUMENT	Option '%s' used twice in statement

Error Code	SQLSTATE	Error	Description
1226	42000	ER_USER_LIMIT_REACHED	User '%s' has exceeded the '%s' resource (current value: %ld)
1227	42000	ER_SPECIFIC_ACCESS_DENIED_ERROR	Access denied; you need (at least one of) the %s privilege(s) for this operation
1228	HY000	ER_LOCAL_VARIABLE	Variable '%s' is a SESSION variable and can't be used with SET GLOBAL
1229	HY000	ER_GLOBAL_VARIABLE	Variable '%s' is a GLOBAL variable and should be set with SET GLOBAL
1230	42000	ER_NO_DEFAULT	Variable '%s' doesn't have a default value
1231	42000	ER_WRONG_VALUE_FOR_VAR	Variable '%s' can't be set to the value of '%s'
1232	42000	ER_WRONG_TYPE_FOR_VAR	Incorrect argument type to variable '%s'
1233	HY000	ER_VAR_CANT_BE_READ	Variable '%s' can only be set, not read
1234	42000	ER_CANT_USE_OPTION_HERE	Incorrect usage/placement of '%s'
1235	42000	ER_NOT_SUPPORTED_YET	This version of MariaDB doesn't yet support '%s'
1236	HY000	ER_MASTER_FATAL_ERROR_READING_BINLOG	Got fatal error %d from master when reading data from binary log: '%s'
1237	HY000	ER_SLAVE_IGNORED_TABLE	Slave SQL thread ignored the query because of replicate-*-table rules
1238	HY000	ER_INCORRECT_GLOBAL_LOCAL_VAR	Variable '%s' is a %s variable
1239	42000	ER_WRONG_FK_DEF	Incorrect foreign key definition for '%s': %s
1240	HY000	ER_KEY_REF_DO_NOT_MATCH_TABLE_REF	Key reference and table reference don't match
1241	21000	ER_OPERAND_COLUMNS	Operand should contain %d column(s)
1242	21000	ER_SUBQUERY_NO_1_ROW	Subquery returns more than 1 row
1243	HY000	ER_UNKNOWN_STMT_HANDLER	Unknown prepared statement handler (%.*s) given to %s
1244	HY000	ER_CORRUPT_HELP_DB	Help database is corrupt or does not exist
1245	HY000	ER_CYCLIC_REFERENCE	Cyclic reference on subqueries
1246	HY000	ER_AUTO_CONVERT	Converting column '%s' from %s to %s
1247	42S22	ER_ILLEGAL_REFERENCE	Reference '%s' not supported (%s)
1248	42000	ER_DERIVED_MUST_HAVE_ALIAS	Every derived table must have its own alias
1249	01000	ER_SELECT_REDUCED	Select %u was reduced during optimization

Error Code	SQLSTATE	Error	Description
1250	42000	ER_TABLENAME_NOT_ALLOWED_HERE	Table '%s' from one of the SELECTs cannot be used in %s
1251	08004	ER_NOT_SUPPORTED_AUTH_MODE	Client does not support authentication protocol requested by server; consider upgrading MariaDB client
1252	42000	ER_SPATIAL_CANT_HAVE_NULL	All parts of a SPATIAL index must be NOT NULL
1253	42000	ER_COLLATION_CHARSET_MISMATCH	COLLATION '%s' is not valid for CHARACTER SET '%s'
1254	HY000	ER_SLAVE_WAS_RUNNING	Slave is already running
1255	HY000	ER_SLAVE_WAS_NOT_RUNNING	Slave already has been stopped
1256	HY000	ER_TOO_BIG_FOR_UNCOMPRESS	Uncompressed data size too large; the maximum size is %d (probably, length of uncompressed data was corrupted)
1257	HY000	ER_ZLIB_Z_MEM_ERROR	ZLIB: Not enough memory
1258	HY000	ER_ZLIB_Z_BUF_ERROR	ZLIB: Not enough room in the output buffer (probably, length of uncompressed data was corrupted)
1259	HY000	ER_ZLIB_Z_DATA_ERROR	ZLIB: Input data corrupted
1260	HY000	ER_CUT_VALUE_GROUP_CONCAT	Row %u was cut by GROUP_CONCAT()
1261	01000	ER_WARN_TOO_FEW_RECORDS	Row %ld doesn't contain data for all columns
1262	01000	ER_WARN_TOO_MANY_RECORDS	Row %ld was truncated; it contained more data than there were input columns
1263	22004	ER_WARN_NULL_TO_NOTNULL	Column set to default value; NULL supplied to NOT NULL column '%s' at row %ld
1264	22003	ER_WARN_DATA_OUT_OF_RANGE	Out of range value for column '%s' at row %ld
1265	01000	WARN_DATA_TRUNCATED	Data truncated for column '%s' at row %ld
1266	HY000	ER_WARN_USING_OTHER_HANDLER	Using storage engine %s for table '%s'
1267	HY000	ER_CANT_AGGREGATE_2COLLATIONS	Illegal mix of collations (%s,%s) and (%s,%s) for operation '%s'
1268	HY000	ER_DROP_USER	Cannot drop one or more of the requested users
1269	HY000	ER_REVOKE_GRANTS	Can't revoke all privileges for one or more of the requested users
1270	HY000	ER_CANT_AGGREGATE_3COLLATIONS	Illegal mix of collations (%s,%s), (%s,%s), (%s,%s) for operation '%s'
1271	HY000	ER_CANT_AGGREGATE_NCOLLATIONS	Illegal mix of collations for operation '%s'
1272	HY000	ER_VARIABLE_IS_NOT_STRUCT	Variable '%s' is not a variable component (can't be used as XXXX.variable_name)

Error Code	SQLSTATE	Error	Description
1273	HY000	ER_UNKNOWN_COLLATION	Unknown collation: '%s'
1274	HY000	ER_SLAVE_IGNORED_SSL_PARAMS	SSL parameters in CHANGE MASTER are ignored because this MariaDB slave was compiled without SSL support; they can be used later if MariaDB slave with SSL is started
1275	HY000	ER_SERVER_IS_IN_SECURE_AUTH_MODE	Server is running in –secure-auth mode, but '%s'@'%s' has a password in the old format; please change the password to the new format
1276	HY000	ER_WARN_FIELD_RESOLVED	Field or reference '%s%s%s%s%s' of SELECT #%d was resolved in SELECT #%d
1277	HY000	ER_BAD_SLAVE_UNTIL_COND	Incorrect parameter or combination of parameters for START SLAVE UNTIL
1278	HY000	ER_MISSING_SKIP_SLAVE	It is recommended to use –skip-slave-start when doing step-by-step replication with START SLAVE UNTIL; otherwise, you will get problems if you get an unexpected slave's mysqld restart
1279	HY000	ER_UNTIL_COND_IGNORED	SQL thread is not to be started so UNTIL options are ignored
1280	42000	ER_WRONG_NAME_FOR_INDEX	Incorrect index name '%s'
1281	42000	ER_WRONG_NAME_FOR_CATALOG	Incorrect catalog name '%s'
1282	HY000	ER_WARN_QC_RESIZE	Query cache failed to set size %lu; new query cache size is %lu
1283	HY000	ER_BAD_FT_COLUMN	Column '%s' cannot be part of FULLTEXT index
1284	HY000	ER_UNKNOWN_KEY_CACHE	Unknown key cache '%s'
1285	HY000	ER_WARN_HOSTNAME_WONT_WORK	MariaDB is started in –skip-name-resolve mode; you must restart it without this switch for this grant to work
1286	42000	ER_UNKNOWN_STORAGE_ENGINE	Unknown storage engine '%s'
1287	HY000	ER_WARN_DEPRECATED_SYNTAX	'%s' is deprecated and will be removed in a future release. Please use %s instead
1288	HY000	ER_NON_UPDATABLE_TABLE	The target table %s of the %s is not updatable
1289	HY000	ER_FEATURE_DISABLED	The '%s' feature is disabled; you need MariaDB built with '%s' to have it working
1290	HY000	ER_OPTION_PREVENTS_STATEMENT	The MariaDB server is running with the %s option so it cannot execute this statement
1291	HY000	ER_DUPLICATED_VALUE_IN_TYPE	Column '%s' has duplicated value '%s' in %s
1292	22007	ER_TRUNCATED_WRONG_VALUE	Truncated incorrect %s value: '%s'
1293	HY000	ER_TOO_MUCH_AUTO_TIMESTAMP_COLS	Incorrect table definition; there can be only one TIMESTAMP column with CURRENT_TIMESTAMP in DEFAULT or ON UPDATE clause
1294	HY000	ER_INVALID_ON_UPDATE	Invalid ON UPDATE clause for '%s' column
1295	HY000	ER_UNSUPPORTED_PS	This command is not supported in the prepared statement protocol yet

Error Code	SQLSTATE	Error	Description
1296	HY000	ER_GET_ERRMSG	Got error %d '%s' from %s
1297	HY000	ER_GET_TEMPORARY_ERRMSG	Got temporary error %d '%s' from %s
1298	HY000	ER_UNKNOWN_TIME_ZONE	Unknown or incorrect time zone: '%s'
1299	HY000	ER_WARN_INVALID_TIMESTAMP	Invalid TIMESTAMP value in column '%s' at row %ld

Error Code	SQLSTATE	Error	Description
1300	HY000	ER_INVALID_CHARACTER_STRING	Invalid %s character string: '%s'
1301	HY000	ER_WARN_ALLOWED_PACKET_OVERFLOWED	Result of %s() was larger than max_allowed_packet (%ld) - truncated
1302	HY000	ER_CONFLICTING_DECLARATIONS	Conflicting declarations: '%s%s' and '%s%s'
1303	2F003	ER_SP_NO_RECURSIVE_CREATE	Can't create a %s from within another stored routine
1304	42000	ER_SP_ALREADY_EXISTS	%s %s already exists
1305	42000	ER_SP_DOES_NOT_EXIST	%s %s does not exist
1306	HY000	ER_SP_DROP_FAILED	Failed to DROP %s %s
1307	HY000	ER_SP_STORE_FAILED	Failed to CREATE %s %s
1308	42000	ER_SP_LILABEL_MISMATCH	%s with no matching label: %s
1309	42000	ER_SP_LABEL_REDEFINE	Redefining label %s
1310	42000	ER_SP_LABEL_MISMATCH	End-label %s without match
1311	01000	ER_SP_UNINIT_VAR	Referring to uninitialized variable %s
1312	0A000	ER_SP_BADSELECT	PROCEDURE %s can't return a result set in the given context
1313	42000	ER_SP_BADRETURN	RETURN is only allowed in a FUNCTION
1314	0A000	ER_SP_BADSTATEMENT	%s is not allowed in stored procedures
1315	42000	ER_UPDATE_LOG_DEPRECATED_IGNORED	The update log is deprecated and replaced by the binary log; SET SQL_LOG_UPDATE has been ignored. This option will be removed in MariaDB 5.6.
1316	42000	ER_UPDATE_LOG_DEPRECATED_TRANSLATED	The update log is deprecated and replaced by the binary log; SET SQL_LOG_UPDATE has been translated to SET SQL_LOG_BIN. This option will be removed in MariaDB 5.6.
1317	70100	ER_QUERY_INTERRUPTED	Query execution was interrupted
1318	42000	ER_SP_WRONG_NO_OF_ARGS	Incorrect number of arguments for %s %s; expected %u, got %u
1319	42000	ER_SP_COND_MISMATCH	Undefined CONDITION: %s

Error Code	SQLSTATE	Error	Description
1320	42000	ER_SP_NORETURN	No RETURN found in FUNCTION %s
1321	2F005	ER_SP_NORETURNEND	FUNCTION %s ended without RETURN
1322	42000	ER_SP_BAD_CURSOR_QUERY	Cursor statement must be a SELECT

1415	0A000	ER_SP_NO_RETSET	Not allowed to return a result set from a %s
1416	22003	ER_CANT_CREATE_GEOMETRY_OBJECT	Cannot get geometry object from data you send to the GEOMETRY field
1417	HY000	ER_FAILED_ROUTINE_BREAK_BINLOG	A routine failed and has neither NO SQL nor READS SQL DATA in its declaration and binary logging is enabled; if non-transactional tables were updated, the binary log will miss their changes
1418	HY000	ER_BINLOG_UNSAFE_ROUTINE	This function has none of DETERMINISTIC, NO SQL, or READS SQL DATA in its declaration and binary logging is enabled (you *might* want to use the less safe log_bin_trust_function_creators variable)
1419	HY000	ER_BINLOG_CREATE_ROUTINE_NEED_SUPER	You do not have the SUPER privilege and binary logging is enabled (you *might* want to use the less safe log_bin_trust_function_creators variable)
1420	HY000	ER_EXEC_STMT_WITH_OPEN_CURSOR	You can't execute a prepared statement which has an open cursor associated with it. Reset the statement to re-execute it.
1421	HY000	ER_STMT_HAS_NO_OPEN_CURSOR	The statement (%lu) has no open cursor.
1422	HY000	ER_COMMIT_NOT_ALLOWED_IN_SF_OR_TRG	Explicit or implicit commit is not allowed in stored function or trigger.
1423	HY000	ER_NO_DEFAULT_FOR_VIEW_FIELD	Field of view '%s.%s' underlying table doesn't have a default value
1424	HY000	ER_SP_NO_RECURSION	Recursive stored functions and triggers are not allowed.
1425	42000	ER_TOO_BIG_SCALE	Too big scale %d specified for column '%s'. Maximum is %lu.
1426	42000	ER_TOO_BIG_PRECISION	Too big precision %d specified for column '%s'. Maximum is %lu.
1427	42000	ER_M_BIGGER_THAN_D	For float(M,D, double(M,D or decimal(M,D, M must be >= D (column '%s').
1428	HY000	ER_WRONG_LOCK_OF_SYSTEM_TABLE	You can't combine write-locking of system tables with other tables or lock types
1429	HY000	ER_CONNECT_TO_FOREIGN_DATA_SOURCE	Unable to connect to foreign data source: %s
1430	HY000	ER_QUERY_ON_FOREIGN_DATA_SOURCE	There was a problem processing the query on the foreign data source. Data source error: %s
1431	HY000	ER_FOREIGN_DATA_SOURCE_DOESNT_EXIST	The foreign data source you are trying to reference does not exist. Data source error: %s
1432	HY000	ER_FOREIGN_DATA_STRING_INVALID_CANT_CREATE	Can't create federated table. The data source connection string '%s' is not in the correct format
1433	HY000	ER_FOREIGN_DATA_STRING_INVALID	The data source connection string '%s' is not in the correct format
1434	HY000	ER_CANT_CREATE_FEDERATED_TABLE	Can't create federated table. Foreign data src error: %s
1435	HY000	ER_TRG_IN_WRONG_SCHEMA	Trigger in wrong schema
1436	HY000	ER_STACK_OVERRUN_NEED_MORE	Thread stack overrun: %ld bytes used of a %ld byte stack, and %ld bytes needed. Use 'mysqld –thread_stack=#' to specify a bigger stack.

Error Code	SQLSTATE	Error	Description
1437	42000	ER_TOO_LONG_BODY	Routine body for ‘%s’ is too long
1438	HY000	ER_WARN_CANT_DROP_DEFAULT_KEYCACHE	Cannot drop default keycache
1439	42000	ER_TOO_BIG_DISPLAYWIDTH	Display width out of range for column ‘%s’ (max = %lu)
1440	XAE08	ER_XAER_DUPID	XAER_DUPID: The XID already exists
1441	22008	ER_DATETIME_FUNCTION_OVERFLOW	Datetime function: %s field overflow
1442	HY000	ER_CANT_UPDATE_USED_TABLE_IN_SF_OR_TRG	Can’t update table ‘%s’ in stored function/trigger because it is already used by statement which invoked this stored function/trigger.
1443	HY000	ER_VIEW_PREVENT_UPDATE	The definition of table ‘%s’ prevents operation %s on table ‘%s’.
1444	HY000	ER_PS_NO_RECURSION	The prepared statement contains a stored routine call that refers to that same statement. It’s not allowed to execute a prepared statement in such a recursive manner
1445	HY000	ER_SP_CANT_SET_AUTOCOMMIT	Not allowed to set autocommit from a stored function or trigger
1446	HY000	ER_MALFORMED_DEFINER	Definer is not fully qualified
1447	HY000	ER_VIEW_FRM_NO_USER	View ‘%s’.’%s’ has no definer information (old table format). Current user is used as definer. Please recreate the view!
1448	HY000	ER_VIEW_OTHER_USER	You need the SUPER privilege for creation view with ‘%s’@‘%s’ definer
1449	HY000	ER_NO_SUCH_USER	The user specified as a definer (‘%s’@‘%s’) does not exist
1450	HY000	ER_FORBID_SCHEMA_CHANGE	Changing schema from ‘%s’ to ‘%s’ is not allowed.
1451	23000	ER_ROW_IS_REFERENCED_2	Cannot delete or update a parent row: a foreign key constraint fails (%s)
1452	23000	ER_NO_REFERENCED_ROW_2	Cannot add or update a child row: a foreign key constraint fails (%s)
1453	42000	ER_SP_BAD_VAR_SHADOW	Variable ‘%s’ must be quoted with `...`, or renamed
1454	HY000	ER_TRG_NO_DEFINER	No definer attribute for trigger ‘%s’.’%s’. The trigger will be activated under the authorization of the invoker, which may have insufficient privileges. Please recreate the trigger.
1455	HY000	ER_OLD_FILE_FORMAT	‘%s’ has an old format, you should re-create the ‘%s’ object(s)
1456	HY000	ER_SP_RECURSION_LIMIT	Recursive limit %d (as set by the max_sp_recursion_depth variable) was exceeded for routine %s
1457	HY000	ER_SP_PROC_TABLE_CORRUPT	Failed to load routine %s. The table mysql.proc is missing, corrupt, or contains bad data (internal code %d)
1458	42000	ER_SP_WRONG_NAME	Incorrect routine name ‘%s’
1459	HY000	ER_TABLE_NEEDS_UPGRADE	Table upgrade required. Please do “REPAIR TABLE `%s`” or dump/reload to fix it!

Error Code	SQLSTATE	Error	Description
1460	42000	ER_SP_NO_AGGREGATE	AGGREGATE is not supported for stored functions
1461	42000	ER_MAX_PREPARED_STMT_COUNT_REACHED	Can't create more than max_prepared_stmt_count statements (current value: %lu)
1462	HY000	ER_VIEW_RECURSIVE	`%s`.`%s` contains view recursion
1463	42000	ER_NON_GROUPING_FIELD_USED	Non-grouping field '%s' is used in %s clause
1464	HY000	ER_TABLE_CANT_HANDLE_SPKEYS	The used table type doesn't support SPATIAL indexes
1465	HY000	ER_NO_TRIGGERS_ON_SYSTEM_SCHEMA	Triggers can not be created on system tables
1466	HY000	ER_REMOVED_SPACES	Leading spaces are removed from name '%s'

1468	HY000	ER_USERNAME	user name
1469	HY000	ER_HOSTNAME	host name
1470	HY000	ER_WRONG_STRING_LENGTH	String '%s' is too long for %s (should be no longer than %d)
1471	HY000	ER_NON_INSERTABLE_TABLE	The target table %s of the %s is not insertable-into
1472	HY000	ER_ADMIN_WRONG_MRG_TABLE	Table '%s' is differently defined or of non-MyISAM type or doesn't exist
1473	HY000	ER_TOO_HIGH_LEVEL_OF_NESTING_FOR_SELECT	Too high level of nesting for select
1474	HY000	ER_NAME_BECOMES_EMPTY	Name '%s' has become ''
1475	HY000	ER_AMBIGUOUS_FIELD_TERM	First character of the FIELDS TERMINATED string is ambiguous; please use non-optional and non-empty FIELDS ENCLOSED BY
1476	HY000	ER_FOREIGN_SERVER_EXISTS	The foreign server, %s, you are trying to create already exists.
1477	HY000	ER_FOREIGN_SERVER_DOESNT_EXIST	The foreign server name you are trying to reference does not exist. Data source error: %s
1478	HY000	ER_ILLEGAL_HA_CREATE_OPTION	Table storage engine '%s' does not support the create option '%s'
1479	HY000	ER_PARTITION_REQUIRES_VALUES_ERROR	Syntax error: %s PARTITIONING requires definition of VALUES %s for each partition
1480	HY000	ER_PARTITION_WRONG_VALUES_ERROR	Only %s PARTITIONING can use VALUES %s in partition definition
1481	HY000	ER_PARTITION_MAXVALUE_ERROR	MAXVALUE can only be used in last partition definition
1482	HY000	ER_PARTITION_SUBPARTITION_ERROR	Subpartitions can only be hash partitions and by key

Error Code	SQLSTATE	Error	Description
1483	HY000	ER_PARTITION_SUBPART_MIX_ERROR	Must define subpartitions on all partitions if on one partition
1484	HY000	ER_PARTITION_WRONG_NO_PART_ERROR	Wrong number of partitions defined, mismatch with previous setting
1485	HY000	ER_PARTITION_WRONG_NO_SUBPART_ERROR	Wrong number of subpartitions defined, mismatch with previous setting
1486	HY000	ER_CONST_EXPR_IN_PARTITION_FUNC_ERROR	Constant/Random expression in (sub) partitioning function is not allowed
1486	HY000	ER_WRONG_EXPR_IN_PARTITION_FUNC_ERROR	Constant, random or timezone-dependent expressions in (sub) partitioning function are not allowed
1487	HY000	ER_NO_CONST_EXPR_IN_RANGE_OR_LIST_ERROR	Expression in RANGE/LIST VALUES must be constant
1488	HY000	ER_FIELD_NOT_FOUND_PART_ERROR	Field in list of fields for partition function not found in table
1489	HY000	ER_LIST_OF_FIELDS_ONLY_IN_HASH_ERROR	List of fields is only allowed in KEY partitions
1490	HY000	ER_INCONSISTENT_PARTITION_INFO_ERROR	The partition info in the frm file is not consistent with what can be written into the frm file
1491	HY000	ER_PARTITION_FUNC_NOT_ALLOWED_ERROR	The %s function returns the wrong type
1492	HY000	ER_PARTITIONS_MUST_BE_DEFINED_ERROR	For %s partitions each partition must be defined
1493	HY000	ER_RANGE_NOT_INCREASING_ERROR	VALUES LESS THAN value must be strictly increasing for each partition
1494	HY000	ER_INCONSISTENT_TYPE_OF_FUNCTIONS_ERROR	VALUES value must be of same type as partition function
1495	HY000	ER_MULTIPLE_DEF_CONST_IN_LIST_PART_ERROR	Multiple definition of same constant in list partitioning
1496	HY000	ER_PARTITION_ENTRY_ERROR	Partitioning can not be used stand-alone in query
1497	HY000	ER_MIX_HANDLER_ERROR	The mix of handlers in the partitions is not allowed in this version of MariaDB
1498	HY000	ER_PARTITION_NOT_DEFINED_ERROR	For the partitioned engine it is necessary to define all %s
1499	HY000	ER_TOO_MANY_PARTITIONS_ERROR	Too many partitions (including subpartitions) were defined

Error Code	SQLSTATE	Error	Description
1500	HY000	ER_SUBPARTITION_ERROR	It is only possible to mix RANGE/LIST partitioning with HASH/KEY partitioning for subpartitioning
1501	HY000	ER_CANT_CREATE_HANDLER_FILE	Failed to create specific handler file
1502	HY000	ER_BLOB_FIELD_IN_PART_FUNC_ERROR	A BLOB field is not allowed in partition function

Error Code	SQLSTATE	Error	Description
1503	HY000	ER_UNIQUE_KEY_NEED_ALL_FIELDS_IN_PF	A %s must include all columns in the table's partitioning function
1504	HY000	ER_NO_PARTS_ERROR	Number of %s = 0 is not an allowed value
1505	HY000	ER_PARTITION_MGMT_ON_NONPARTITIONED	Partition management on a not partitioned table is not possible
1506	HY000	ER_FOREIGN_KEY_ON_PARTITIONED	Foreign key clause is not yet supported in conjunction with partitioning
1507	HY000	ER_DROP_PARTITION_NON_EXISTENT	Error in list of partitions to %s
1508	HY000	ER_DROP_LAST_PARTITION	Cannot remove all partitions, use DROP TABLE instead
1509	HY000	ER_COALESCE_ONLY_ON_HASH_PARTITION	COALESCE PARTITION can only be used on HASH/KEY partitions
1510	HY000	ER_REORG_HASH_ONLY_ON_SAME_N	REORGANIZE PARTITION can only be used to reorganize partitions not to change their numbers
1511	HY000	ER_REORG_NO_PARAM_ERROR	REORGANIZE PARTITION without parameters can only be used on auto-partitioned tables using HASH PARTITIONs
1512	HY000	ER_ONLY_ON_RANGE_LIST_PARTITION	%s PARTITION can only be used on RANGE/LIST partitions
1513	HY000	ER_ADD_PARTITION_SUBPART_ERROR	Trying to Add partition(s) with wrong number of subpartitions
1514	HY000	ER_ADD_PARTITION_NO_NEW_PARTITION	At least one partition must be added
1515	HY000	ER_COALESCE_PARTITION_NO_PARTITION	At least one partition must be coalesced
1516	HY000	ER_REORG_PARTITION_NOT_EXIST	More partitions to reorganize than there are partitions
1517	HY000	ER_SAME_NAME_PARTITION	Duplicate partition name %s
1518	HY000	ER_NO_BINLOG_ERROR	It is not allowed to shut off binlog on this command
1519	HY000	ER_CONSECUTIVE_REORG_PARTITIONS	When reorganizing a set of partitions they must be in consecutive order
1520	HY000	ER_REORG_OUTSIDE_RANGE	Reorganize of range partitions cannot change total ranges except for last partition where it can extend the range
1521	HY000	ER_PARTITION_FUNCTION_FAILURE	Partition function not supported in this version for this handler
1522	HY000	ER_PART_STATE_ERROR	Partition state cannot be defined from CREATE/ALTER TABLE
1523	HY000	ER_LIMITED_PART_RANGE	The %s handler only supports 32 bit integers in VALUES
1524	HY000	ER_PLUGIN_IS_NOT_LOADED	Plugin '%s' is not loaded
1525	HY000	ER_WRONG_VALUE	Incorrect %s value: '%s'

Error Code	SQLSTATE	Error	Description
1526	HY000	ER_NO_PARTITION_FOR_GIVEN_VALUE	Table has no partition for value %s
1527	HY000	ER_FILEGROUP_OPTION_ONLY_ONCE	It is not allowed to specify %s more than once
1528	HY000	ER_CREATE_FILEGROUP_FAILED	Failed to create %s
1529	HY000	ER_DROP_FILEGROUP_FAILED	Failed to drop %s
1530	HY000	ER_TABLESPACE_AUTO_EXTEND_ERROR	The handler doesn't support autoextend of tablespaces
1531	HY000	ER_WRONG_SIZE_NUMBER	A size parameter was incorrectly specified, either number or on the form 10M
1532	HY000	ER_SIZE_OVERFLOW_ERROR	The size number was correct but we don't allow the digit part to be more than 2 billion
1533	HY000	ER_ALTER_FILEGROUP_FAILED	Failed to alter: %s
1534	HY000	ER_BINLOG_ROW_LOGGING_FAILED	Writing one row to the row-based binary log failed
1535	HY000	ER_BINLOG_ROW_WRONG_TABLE_DEF	Table definition on master and slave does not match: %s
1536	HY000	ER_BINLOG_ROW_RBR_TO_SBR	Slave running with –log-slave-updates must use row-based binary logging to be able to replicate row-based binary log events
1537	HY000	ER_EVENT_ALREADY_EXISTS	Event '%s' already exists
1538	HY000	ER_EVENT_STORE_FAILED	Failed to store event %s. Error code %d from storage engine.
1539	HY000	ER_EVENT_DOES_NOT_EXIST	Unknown event '%s'
1540	HY000	ER_EVENT_CANT_ALTER	Failed to alter event '%s'
1541	HY000	ER_EVENT_DROP_FAILED	Failed to drop %s
1542	HY000	ER_EVENT_INTERVAL_NOT_POSITIVE_OR_TOO_BIG	INTERVAL is either not positive or too big
1543	HY000	ER_EVENT_ENDS_BEFORE_STARTS	ENDS is either invalid or before STARTS
1544	HY000	ER_EVENT_EXEC_TIME_IN_THE_PAST	Event execution time is in the past. Event has been disabled
1545	HY000	ER_EVENT_OPEN_TABLE_FAILED	Failed to open mysql.event
1546	HY000	ER_EVENT_NEITHER_M_EXPR_NOR_M_AT	No datetime expression provided
1547	HY000	ER_COL_COUNT_DOESNT_MATCH_CORRUPTED	Column count of mysql.%s is wrong. Expected %d, found %d. The table is probably corrupted
1548	HY000	ER_CANNOT_LOAD_FROM_TABLE	Cannot load from mysql.%s. The table is probably corrupted

Error Code	SQLSTATE	Error	Description
1549	HY000	ER_EVENT_CANNOT_DELETE	Failed to delete the event from mysql.event
1550	HY000	ER_EVENT_COMPILE_ERROR	Error during compilation of event's body
1551	HY000	ER_EVENT_SAME_NAME	Same old and new event name
1552	HY000	ER_EVENT_DATA_TOO_LONG	Data for column '%s' too long
1553	HY000	ER_DROP_INDEX_FK	Cannot drop index '%s': needed in a foreign key constraint
1554	HY000	ER_WARN_DEPRECATED_SYNTAX_WITH_VER	The syntax '%s' is deprecated and will be removed in MariaDB %s. Please use %s instead
1555	HY000	ER_CANT_WRITE_LOCK_LOG_TABLE	You can't write-lock a log table. Only read access is possible
1556	HY000	ER_CANT_LOCK_LOG_TABLE	You can't use locks with log tables.
1557	23000	ER_FOREIGN_DUPLICATE_KEY	Upholding foreign key constraints for table '%s', entry '%s', key %d would lead to a duplicate entry
1558	HY000	ER_COL_COUNT_DOESNT_MATCH_PLEASE_UPDATE	Column count of mysql.%s is wrong. Expected %d, found %d. Created with MariaDB %d, now running %d. Please use mysql_upgrade to fix this error.
1559	HY000	ER_TEMP_TABLE_PREVENTS_SWITCH_OUT_OF_RBR	Cannot switch out of the row-based binary log format when the session has open temporary tables
1560	HY000	ER_STORED_FUNCTION_PREVENTS_SWITCH_BINLOG_FORMAT	Cannot change the binary logging format inside a stored function or trigger
1561		ER_UNUSED_13	You should never see it
1562	HY000	ER_PARTITION_NO_TEMPORARY	Cannot create temporary table with partitions
1563	HY000	ER_PARTITION_CONST_DOMAIN_ERROR	Partition constant is out of partition function domain
1564	HY000	ER_PARTITION_FUNCTION_IS_NOT_ALLOWED	This partition function is not allowed
1565	HY000	ER_DDL_LOG_ERROR	Error in DDL log
1566	HY000	ER_NULL_IN_VALUES_LESS_THAN	Not allowed to use NULL value in VALUES LESS THAN
1567	HY000	ER_WRONG_PARTITION_NAME	Incorrect partition name
1568	25001	ER_CANT_CHANGE_TX_ISOLATION	Transaction isolation level can't be changed while a transaction is in progress
1569	HY000	ER_DUP_ENTRY_AUTOINCREMENT_CASE	ALTER TABLE causes auto_increment resequencing, resulting in duplicate entry '%s' for key '%s'
1570	HY000	ER_EVENT_MODIFY_QUEUE_ERROR	Internal scheduler error %d
1571	HY000	ER_EVENT_SET_VAR_ERROR	Error during starting/stopping of the scheduler. Error code %u

Error Code	SQLSTATE	Error	Description
1572	HY000	ER_PARTITION_MERGE_ERROR	Engine cannot be used in partitioned tables
1573	HY000	ER_CANT_ACTIVATE_LOG	Cannot activate '%s' log
1574	HY000	ER_RBR_NOT_AVAILABLE	The server was not built with row-based replication
1575	HY000	ER_BASE64_DECODE_ERROR	Decoding of base64 string failed
1576	HY000	ER_EVENT_RECURSION_FORBIDDEN	Recursion of EVENT DDL statements is forbidden when body is present

1818	HY000	ER_INVALID_YEAR_COLUMN_LENGTH	YEAR(%lu) column type is deprecated. Creating YEAR(4) column instead.
1819	HY000	ER_NOT_VALID_PASSWORD	Your password does not satisfy the current policy requirements

Error Code	SQLSTATE	Error	Description
1820	HY000	ER_MUST_CHANGE_PASSWORD	You must SET PASSWORD before executing this statement
1821	HY000	ER_FK_NO_INDEX_CHILD	Failed to add the foreign key constraint. Missing index for constraint ‘%s’ in the foreign table ‘%s’
1822	HY000	ER_FK_NO_INDEX_PARENT	Failed to add the foreign key constraint. Missing index for constraint ‘%s’ in the referenced table ‘%s’
1823	HY000	ER_FK_FAIL_ADD_SYSTEM	Failed to add the foreign key constraint ‘%s’ to system tables
1824	HY000	ER_FK_CANNOT_OPEN_PARENT	Failed to open the referenced table ‘%s’
1825	HY000	ER_FK_INCORRECT_OPTION	Failed to add the foreign key constraint on table ‘%s’. Incorrect options in FOREIGN KEY constraint ‘%s’
1826	HY000	ER_FK_DUP_NAME	Duplicate foreign key constraint name ‘%s’
1827	HY000	ER_PASSWORD_FORMAT	The password hash doesn’t have the expected format. Check if the correct password algorithm is being used with the PASSWORD() function.
1828	HY000	ER_FK_COLUMN_CANNOT_DROP	Cannot drop column ‘%s’: needed in a foreign key constraint ‘%s’
1829	HY000	ER_FK_COLUMN_CANNOT_DROP_CHILD	Cannot drop column ‘%s’: needed in a foreign key constraint ‘%s’ of table ‘%s’
1830	HY000	ER_FK_COLUMN_NOT_NULL	Column ‘%s’ cannot be NOT NULL: needed in a foreign key constraint ‘%s’ SET NULL
1831	HY000	ER_DUP_INDEX	Duplicate index ‘%s’ defined on the table ‘%s.%s’. This is deprecated and will be disallowed in a future release.
1832	HY000	ER_FK_COLUMN_CANNOT_CHANGE	Cannot change column ‘%s’: used in a foreign key constraint ‘%s’
1833	HY000	ER_FK_COLUMN_CANNOT_CHANGE_CHILD	Cannot change column ‘%s’: used in a foreign key constraint ‘%s’ of table ‘%s’
1834	HY000	ER_FK_CANNOT_DELETE_PARENT	Cannot delete rows from table which is parent in a foreign key constraint ‘%s’ of table ‘%s’
1835	HY000	ER_MALFORMED_PACKET	Malformed communication packet.
1836	HY000	ER_READ_ONLY_MODE	Running in read-only mode
1837	HY000	ER_GTID_NEXT_TYPE_UNDEFINED_GROUP	When GTID_NEXT is set to a GTID, you must explicitly set it again after a COMMIT or ROLLBACK. If you see this error message in the slave SQL thread, it means that a table in the current transaction is transactional on the master and non-transactional on the slave. In a client connection, it means that you executed SET GTID_NEXT before a transaction and forgot to set GTID_NEXT to a different identifier or to ‘AUTOMATIC’ after COMMIT or ROLLBACK. Current GTID_NEXT is ‘%s’
1838	HY000	ER_VARIABLE_NOT_SETTABLE_IN_SP	The system variable %s cannot be set in stored procedures.

Error Code	SQLSTATE	Error	Description
1839	HY000	ER_CANT_SET_GTID_PURGED_WHEN_GTID_MODE_IS_OFF	@@GLOBAL.GTID_PURGED can only be set when @@GLOBAL.GTID_MODE = ON.
1840	HY000	ER_CANT_SET_GTID_PURGED_WHEN_GTID_EXECUTED_IS_NOT_EMPTY	@@GLOBAL.GTID_PURGED can only be set when @@GLOBAL.GTID_EXECUTED is empty.
1841	HY000	ER_CANT_SET_GTID_PURGED_WHEN_OWNED_GTIDS_IS_NOT_EMPTY	@@GLOBAL.GTID_PURGED can only be set when there are no ongoing transactions (not even in other clients).
1842	HY000	ER_GTID_PURGED_WAS_CHANGED	@@GLOBAL.GTID_PURGED was changed from ‘%s’ to ‘%s’.
1843	HY000	ER_GTID_EXECUTED_WAS_CHANGED	@@GLOBAL.GTID_EXECUTED was changed from ‘%s’ to ‘%s’.
1844	HY000	ER_BINLOG_STMT_MODE_AND_NO_REPL_TABLES	Cannot execute statement: impossible to write to binary log since BINLOG_FORMAT = STATEMENT, and both replicated and non replicated tables are written to.
1845	0A000	ER_ALTER_OPERATION_NOT_SUPPORTED	%s is not supported for this operation. Try %s.
1846	0A000	ER_ALTER_OPERATION_NOT_SUPPORTED_REASON	%s is not supported. Reason: %s. Try %s.
1847	HY000	ER_ALTER_OPERATION_NOT_SUPPORTED_REASON_COPY	COPY algorithm requires a lock
1848	HY000	ER_ALTER_OPERATION_NOT_SUPPORTED_REASON_PARTITION	Partition specific operations do not yet support LOCK/ALGORITHM
1849	HY000	ER_ALTER_OPERATION_NOT_SUPPORTED_REASON_FK_RENAME	Columns participating in a foreign key are renamed
1850	HY000	ER_ALTER_OPERATION_NOT_SUPPORTED_REASON_COLUMN_TYPE	Cannot change column type INPLACE

Error Code	SQLSTATE	Error	Description
1851	HY000	ER_ALTER_OPERATION_NOT_SUPPORTED_REASON_FK_CHECK	Adding foreign keys needs foreign_key_checks=OFF
1852	HY000	ER_ALTER_OPERATION_NOT_SUPPORTED_REASON_IGNORE	Creating unique indexes with IGNORE requires COPY algorithm to remove duplicate rows
1853	HY000	ER_ALTER_OPERATION_NOT_SUPPORTED_REASON_NOPK	Dropping a primary key is not allowed without also adding a new primary key
1854	HY000	ER_ALTER_OPERATION_NOT_SUPPORTED_REASON_AUTOINC	Adding an auto-increment column requires a lock
1855	HY000	ER_ALTER_OPERATION_NOT_SUPPORTED_REASON_HIDDEN_FTS	Cannot replace hidden FTS_DOC_ID with a user-visible one
1856	HY000	ER_ALTER_OPERATION_NOT_SUPPORTED_REASON_CHANGE_FTS	Cannot drop or rename FTS_DOC_ID
1857	HY000	ER_ALTER_OPERATION_NOT_SUPPORTED_REASON_FTS	Fulltext index creation requires a lock
1858	HY000	ER_SQL_SLAVE_SKIP_COUNTER_NOT_SETTABLE_IN_GTID_MODE	sql_slave_skip_counter can not be set when the server is running with @@GLOBAL.GTID_MODE = ON. Instead, for each transaction that you want to skip, generate an empty transaction with the same GTID as the transaction
1859	23000	ER_DUP_UNKNOWN_IN_INDEX	Duplicate entry for key '%s'
1860	HY000	ER_IDENT_CAUSES_TOO_LONG_PATH	Long database name and identifier for object resulted in path length exceeding %d characters. Path: '%s'.
1861	HY000	ER_ALTER_OPERATION_NOT_SUPPORTED_REASON_NOT_NULL	cannot silently convert NULL values, as required in this SQL_MODE
1862	HY000	ER_MUST_CHANGE_PASSWORD_LOGIN	Your password has expired. To log in you must change it using a client that supports expired passwords.
1863	HY000	ER_ROW_IN_WRONG_PARTITION	Found a row in wrong partition %s

Error Code	SQLSTATE	Error	Description
1864	HY000	ER_MTS_EVENT_BIGGER_PENDING_JOBS_SIZE_MAX	Cannot schedule event %s, relay-log name %s, position %s to Worker thread because its size %lu exceeds %lu of slave_pending_jobs_size_max.
1865	HY000	ER_INNODB_NO_FT_USES_PARSER	Cannot CREATE FULLTEXT INDEX WITH PARSER on InnoDB table
1866	HY000	ER_BINLOG_LOGICAL_CORRUPTION	The binary log file '%s' is logically corrupted: %s
1867	HY000	ER_WARN_PURGE_LOG_IN_USE	file %s was not purged because it was being read by %d thread(s), purged only %d out of %d files.
1868	HY000	ER_WARN_PURGE_LOG_IS_ACTIVE	file %s was not purged because it is the active log file.
1869	HY000	ER_AUTO_INCREMENT_CONFLICT	Auto-increment value in UPDATE conflicts with internally generated values
1870	HY000	WARN_ON_BLOCKHOLE_IN_RBR	Row events are not logged for %s statements that modify BLACKHOLE tables in row format. Table(s): '%s'
1871	HY000	ER_SLAVE_MI_INIT_REPOSITORY	Slave failed to initialize master info structure from the repository
1872	HY000	ER_SLAVE_RLI_INIT_REPOSITORY	Slave failed to initialize relay log info structure from the repository
1873	28000	ER_ACCESS_DENIED_CHANGE_USER_ERROR	Access denied trying to change to user '%s'@'%s' (using password: %s). Disconnecting.
1874	HY000	ER_INNODB_READ_ONLY	InnoDB is in read only mode.
1875	HY000	ER_STOP_SLAVE_SQL_THREAD_TIMEOUT	STOP SLAVE command execution is incomplete: Slave SQL thread got the stop signal, thread is busy, SQL thread will stop once the current task is complete.
1876	HY000	ER_STOP_SLAVE_IO_THREAD_TIMEOUT	STOP SLAVE command execution is incomplete: Slave IO thread got the stop signal, thread is busy, IO thread will stop once the current task is complete.
1877	HY000	ER_TABLE_CORRUPT	Operation cannot be performed. The table '%s.%s' is missing, corrupt or contains bad data.
1878	HY000	ER_TEMP_FILE_WRITE_FAILURE	Temporary file write failure.
1879	HY000	ER_INNODB_FT_AUX_NOT_HEX_ID	Upgrade index name failed, please use create index(alter table) algorithm copy to rebuild index.

1918		ER_BAD_DATA 22007	Encountered illegal value ‘%-.128s’ when converting to %-.32s
1919		ER_DYN_COL_WRONG_FORMAT	Encountered illegal format of dynamic column string
1920		ER_DYN_COL_IMPLEMENTATION_LIMIT	Dynamic column implementation limit reached
1921		ER_DYN_COL_DATA 22007	Illegal value used as argument of dynamic column function
1922		ER_DYN_COL_WRONG_CHARSET	Dynamic column contains unknown character set

Error Code	SQLSTATE	Error	Description
1923		ER_ILLEGAL_SUBQUERY_OPTIMIZER_SWITCHES	At least one of the 'in_to_exists' or 'materialization' optimizer_switch flags must be 'on'.
1924		ER_QUERY_CACHE_IS_DISABLED	Query cache is disabled (resize or similar command in progress); repeat this command later
1925		ER_QUERY_CACHE_IS_GLOBALY_DISABLED	Query cache is globally disabled and you can't enable it only for this session
1926		ER_VIEW_ORDERBY_IGNORED	View '%-.192s'.'%-.192s' ORDER BY clause ignored because there is other ORDER BY clause already.
1927	70100	ER_CONNECTION_KILLED	Connection was killed
1928		ER_UNUSED_11	You should never see it
1929		ER_INSIDE_TRANSACTION_PREVENTS_SWITCH_SKIP_REPLICATION	Cannot modify @@session.skip_replication inside a transaction
1930		ER_STORED_FUNCTION_PREVENTS_SWITCH_SKIP_REPLICATION	Cannot modify @@session.skip_replication inside a stored function or trigger
1931		ER_QUERY_RESULT_INCOMPLETE	Query execution was interrupted. The query exceeded %s %llu. The query result may be incomplete
1932		ER_NO_SUCH_TABLE_IN_ENGINE 42S02	Table '%-.192s.%-.192s' doesn't exist in engine
1933		ER_TARGET_NOT_EXPLAINABLE	Target is not running an EXPLAINable command
1934		ER_CONNECTION_ALREADY_EXISTS	Connection '%.*s' conflicts with existing connection '%.*s'
1935		ER_MASTER_LOG_PREFIX	Master '%.*s':
1936		ER_CANT_START_STOP_SLAVE	Can't %s SLAVE '%.*s'
1937		ER_SLAVE_STARTED	SLAVE '%.*s' started
1938		ER_SLAVE_STOPPED	SLAVE '%.*s' stopped
1939		ER_SQL_DISCOVER_ERROR	Engine %s failed to discover table % `-.192s.%` -.192s with '%s'
1940		ER_FAILED_GTID_STATE_INIT	Failed initializing replication GTID state
1941		ER_INCORRECT_GTID_STATE	Could not parse GTID list
1942		ER_CANNOT_UPDATE_GTID_STATE	Could not update replication slave gtid state
1943		ER_DUPLICATE_GTID_DOMAIN	GTID %u-%u-%llu and %u-%u-%llu conflict (duplicate domain id %u)
1944		ER_GTID_OPEN_TABLE_FAILED	Failed to open %s.%s
1945		ER_GTID_POSITION_NOT_FOUND_IN_BINLOG	Connecting slave requested to start from GTID %u-%u-%llu, which is not in the master's binlog

Error Code	SQL STATE	Error	Description
1946		ER_CANNOT_LOAD_SLAVE_GTID_STATE	Failed to load replication slave GTID position from table %s.%s
1947		ER_MASTER_GTID_POS_CONFLICTS_WITH_BINLOG	Specified GTID %u-%u-%llu conflicts with the binary log which contains a more recent GTID %u-%u-%llu. If MASTER_GTID_POS=CURRENT_POS is used, the binlog position will override the new value of @@gtid_slave_pos.
1948		ER_MASTER_GTID_POS_MISSING_DOMAIN	Specified value for @@gtid_slave_pos contains no value for replication domain %u. This conflicts with the binary log which contains GTID %u-%u-%llu. If MASTER_GTID_POS=CURRENT_POS is used, the binlog position will override the new value of @@gtid_slave_pos.
1949		ER_UNTIL_REQUIRES_USING_GTID	START SLAVE UNTIL master_gtid_pos requires that slave is using GTID
1950		ER_GTID_STRICT_OUT_OF_ORDER	An attempt was made to binlog GTID %u-%u-%llu which would create an out-of-order sequence number with existing GTID %u-%u-%llu, and gtid strict mode is enabled.
1951		ER_GTID_START_FROM_BINLOG_HOLE	The binlog on the master is missing the GTID %u-%u-%llu requested by the slave (even though a subsequent sequence number does exist), and GTID strict mode is enabled
1952		ER_SLAVE_UNEXPECTED_MASTER_SWITCH	Unexpected GTID received from master after reconnect. This normally indicates that the master server was replaced without restarting the slave threads. %s
1953		ER_INSIDE_TRANSACTION_PREVENTS_SWITCH_GTID_DOMAIN_ID_SEQ_NO	Cannot modify @@session.gtid_domain_id or @@session.gtid_seq_no inside a transaction
1954		ER_STORED_FUNCTION_PREVENTS_SWITCH_GTID_DOMAIN_ID_SEQ_NO	Cannot modify @@session.gtid_domain_id or @@session.gtid_seq_no inside a stored function or trigger
1955		ER_GTID_POSITION_NOT_FOUND_IN_BINLOG2	Connecting slave requested to start from GTID %u-%u-%llu, which is not in the master's binlog. Since the master's binlog contains GTIDs with higher sequence numbers, it probably means that the slave has diverged due to executing extra erroneous transactions
1956		ER_BINLOG_MUST_BE_EMPTY	This operation is not allowed if any GTID has been logged to the binary log. Run RESET MASTER first to erase the log
1957		ER_NO_SUCH_QUERY	Unknown query id: %lld
1958		ER_BAD_BASE64_DATA	Bad base64 data as position %u
1959		ER_INVALID_ROLE	Invalid role specification %`s.
1960		ER_INVALID_CURRENT_USER	The current user is invalid.
1961		ER_CANNOT_GRANT_ROLE	Cannot grant role '%s' to: %s.
1962		ER_CANNOT_REVOKE_ROLE	Cannot revoke role '%s' from: %s.
1963		ER_CHANGE_SLAVE_PARALLEL_THREADS_ACTIVE	Cannot change @@slave_parallel_threads while another change is in progress
1964		ER_PRIOR_COMMIT_FAILED	Commit failed due to failure of an earlier commit on which this one depends
1965		ER_IT_IS_A_VIEW	'%-.192s' is a view
1966		ER_SLAVE_SKIP_NOT_IN_GTID	When using GTID, @@sql_slave_skip_counter can not be used. Instead, setting @@gtid_slave_pos explicitly can be used to skip to after a given GTID position.
1967		ER_TABLE_DEFINITION_TOO_BIG	The definition for table %`s is too big

Error Code	SQLSTATE	Error	Description
1968		ER_PLUGIN_INSTALLED	Plugin '%-.192s' already installed
1969		ER_STATEMENT_TIMEOUT	Query execution was interrupted (max_statement_time exceeded)
1970		ER_SUBQUERIES_NOT_SUPPORTED	%s does not support subqueries or stored functions.
1971		ER_SET_STATEMENT_NOT_SUPPORTED	The system variable %.200s cannot be set in SET STATEMENT.
1972		ER_UNUSED_9	You should never see it
1973		ER_USER_CREATE_EXISTS	Can't create user '%-.64s'@'%-.64s'; it already exists
1974		ER_USER_DROP_EXISTS	Can't drop user '%-.64s'@'%-.64s'; it doesn't exist
1975		ER_ROLE_CREATE_EXISTS	Can't create role '%-.64s'; it already exists
1976		ER_ROLE_DROP_EXISTS	Can't drop role '%-.64s'; it doesn't exist
1977		ER_CANNOT_CONVERT_CHARACTER	Cannot convert '%s' character 0x%-.64s to '%s'
1978		ER_INVALID_DEFAULT_VALUE_FOR_FIELD	Incorrect default value '%-.128s' for column '%.192s'
1979		ER_KILL_QUERY_DENIED_ERROR	You are not owner of query %lu
1980		ER_NO_EIS_FOR_FIELD	Engine-independent statistics are not collected for column '%s'
1981		ER_WARN_AGGFUNC_DEPENDENCE	Aggregate function '%-.192s)' of SELECT #%d belongs to SELECT #%d
1982		WARN_INNODB_PARTITION_OPTION_IGNORED	<%-.64s> option ignored for InnoDB partition

Error Code	SQLSTATE	Error	Description
3000		ER_FILE_CORRUPT	File %s is corrupted
3001		ER_ERROR_ON_MASTER	Query partially completed on the master (error on master: %d) and was aborted. There is a chance that your master is inconsistent at this point. If you are sure that your master is ok, run this query manually on the slave and then restart the slave with SET GLOBAL SQL_SLAVE_SKIP_COUNTER=1; START SLAVE;. Query:'%s'"
3002		ER_INCONSISTENT_ERROR	Query caused different errors on master and slave. Error on master: message (format)='%s' error code=%d; Error on slave:actual message='%s', error code=%d. Default database:'%s'. Query:'%s'
3003		ER_STORAGE_ENGINE_NOT_LOADED	Storage engine for table '%s'.'%s' is not loaded.
3004		ER_GET_STACKED_DA_WITHOUT_ACTIVE_HANDLER 0Z002	GET STACKED DIAGNOSTICS when handler not active
3005		ER_WARN_LEGACY_SYNTAX_CONVERTED	%s is no longer supported. The statement was converted to %s.

Error Code	SQLSTATE	Error	Description
3006		ER_BINLOG_UNSAFE_FULLTEXT_PLUGIN	Statement is unsafe because it uses a fulltext parser plugin which may not return the same value on the slave.
3007		ER_CANNOT_DISCARD_TEMPORARY_TABLE	Cannot DISCARD/IMPORT tablespace associated with temporary table
3008		ER_FK_DEPTH_EXCEEDED	Foreign key cascade delete/update exceeds max depth of %d.
3009		ER_COL_COUNT_DOESNT_MATCH_PLEASE_UPDATE_V2	Column count of %s.%s is wrong. Expected %d, found %d. Created with MariaDB %d, now running %d. Please use mysql_upgrade to fix this error.
3010		ER_WARN_TRIGGER_DOESNT_HAVE_CREATED	Trigger %s.%s.%s does not have CREATED attribute.
3011		ER_REFERENCED_TRG_DOES_NOT_EXIST_MYSQL	Referenced trigger ‘%s’ for the given action time and event type does not exist.
3012		ER_EXPLAIN_NOT_SUPPORTED	EXPLAIN FOR CONNECTION command is supported only for SELECT/UPDATE/INSERT/DELETE/REPLACE
3013		ER_INVALID_FIELD_SIZE	Invalid size for column ‘%-.192s’.
3014		ER_MISSING_HA_CREATE_OPTION	Table storage engine ‘%-.64s’ found required create option missing
3015		ER_ENGINE_OUT_OF_MEMORY	Out of memory in storage engine ‘%-.64s’.
3016		ER_PASSWORD_EXPIRE_ANONYMOUS_USER	The password for anonymous user cannot be expired.
3017		ER_SLAVE_SQL_THREAD_MUST_STOP	This operation cannot be performed with a running slave sql thread; run STOP SLAVE SQL_THREAD first
3018		ER_NO_FT_MATERIALIZED_SUBQUERY	Cannot create FULLTEXT index on materialized subquery
3019		ER_INNODB_UNDO_LOG_FULL	Undo Log error: %s
3020		ER_INVALID_ARGUMENT_FOR_LOGARITHM	Invalid argument for logarithm
3021		ER_SLAVE_CHANNEL_IO_THREAD_MUST_STOP	This operation cannot be performed with a running slave io thread; run STOP SLAVE IO_THREAD FOR CHANNEL ‘%s’ first.
3022		ER_WARN_OPEN_TEMP_TABLES_MUST_BE_ZERO	This operation may not be safe when the slave has temporary tables. The tables will be kept open until the server restarts or until the tables are deleted by any replicated DROP statement. Suggest to wait until slave_open_temp_tables = 0.
3023		ER_WARN_ONLY_MASTER_LOG_FILE_NO_POS	CHANGE MASTER TO with a MASTER_LOG_FILE clause but no MASTER_LOG_POS clause may not be safe. The old position value may not be valid for the new binary log file.
3024		ER_QUERY_TIMEOUT	Query execution was interrupted, maximum statement execution time exceeded

Error Code	SQLSTATE	Error	Description
3025		ER_NON_RO_SELECT_DISABLE_TIMER	Select is not a read only statement, disabling timer
3026		ER_DUP_LIST_ENTRY	Duplicate entry '%-.192s'.
3027		ER_SQL_MODE_NO_EFFECT	'%s' mode no longer has any effect. Use STRICT_ALL_TABLES or STRICT_TRANS_TABLES instead.
3028		ER_AGGREGATE_ORDER_FOR_UNION	Expression #%u of ORDER BY contains aggregate function and applies to a UNION
3029		ER_AGGREGATE_ORDER_NON_AGG_QUERY	Expression #%u of ORDER BY contains aggregate function and applies to the result of a non-aggregated query
3030		ER_SLAVE_WORKER_STOPPED_PREVIOUS_THD_ERROR	Slave worker has stopped after at least one previous worker encountered an error when slave-preserve-commit-order was enabled. To preserve commit order, the last transaction executed by this thread has not been committed. When restarting the slave after fixing any failed threads, you should fix this worker as well.
3031		ER_DONT_SUPPORT_SLAVE_PRESERVE_COMMIT_ORDER	slave_preserve_commit_order is not supported %s.
3032		ER_SERVER_OFFLINE_MODE	The server is currently in offline mode
3033		ER_GIS_DIFFERENT_SRIDS	Binary geometry function %s given two geometries of different srids: %u and %u, which should have been identical.
3034		ER_GIS_UNSUPPORTED_ARGUMENT	Calling geometry function %s with unsupported types of arguments.
3035		ER_GIS_UNKNOWN_ERROR	Unknown GIS error occurred in function %s.
3036		ER_GIS_UNKNOWN_EXCEPTION	Unknown exception caught in GIS function %s.
3037		ER_GIS_INVALID_DATA	Invalid GIS data provided to function %s.
3038		ER_BOOST_GEOMETRY_EMPTY_INPUT_EXCEPTION	The geometry has no data in function %s.
3039		ER_BOOST_GEOMETRY_CENTROID_EXCEPTION	Unable to calculate centroid because geometry is empty in function %s.
3040		ER_BOOST_GEOMETRY_OVERLAY_INVALID_INPUT_EXCEPTION	Geometry overlay calculation error: geometry data is invalid in function %s.
3041		ER_BOOST_GEOMETRY_TURN_INFO_EXCEPTION	Geometry turn info calculation error: geometry data is invalid in function %s.
3042		ER_BOOST_GEOMETRY_SELF_INTERSECTION_POINT_EXCEPTION	Analysis procedures of intersection points interrupted unexpectedly in function %s.

Error Code	SQLSTATE	Error	Description
3043		ER_BOOST_GEOMETRY_UNKNOWN_EXCEPTION	Unknown exception thrown in function %s.
3044		ER_STD_BAD_ALLOC_ERROR	Memory allocation error: %-.256s in function %s.
3045		ER_STD_DOMAIN_ERROR	Domain error: %-.256s in function %s.
3046		ER_STD_LENGTH_ERROR	Length error: %-.256s in function %s.

3054		ER_STD_UNKNOWN_EXCEPTION	Unknown exception: %-.384s in function %s.
3055		ER_GIS_DATA_WRONG_ENDIANESS	Geometry byte string must be little endian.
3056		ER_CHANGE_MASTER_PASSWORD_LENGTH	The password provided for the replication user exceeds the maximum length of 32 characters
3057	42000	ER_USER_LOCK_WRONG_NAME	Incorrect user-level lock name '%-.192s'.
3058		ER_USER_LOCK_DEADLOCK	Deadlock found when trying to get user-level lock; try rolling back transaction/releasing locks and restarting lock acquisition.
3059		ER_REPLACE_INACCESSIBLE_ROWS	REPLACE cannot be executed as it requires deleting rows that are not in the view
3060		ER_ALTER_OPERATION_NOT_SUPPORTED_REASON_GIS	Do not support online operation on table with GIS index

Error Code	SQLSTATE	Error	Description
4000	0A000	ER_COMMULTI_BADCONTEXT	COM_MULTI can't return a result set in the given context
4001		ER_BAD_COMMAND_IN_MULTI	Command '%s' is not allowed for COM_MULTI

Error Code	SQL STATE	Error	Description
4002		ER_WITH_COL_WRONG_LIST	WITH column list and SELECT field list have different column counts
4003		ER_TOO_MANY_DEFINITIONS_IN_WITH_CLAUSE	Too many WITH elements in WITH clause
4004		ER_DUP_QUERY_NAME	Duplicate query name %`-.64s in WITH clause
4005		ER_RECURSIVE_WITHOUT_ANCHORS	No anchors for recursive WITH element ‘%s’
4006		ER_UNACCEPTABLE_MUTUAL_RECURSION	Unacceptable mutual recursion with anchored table ‘%s’
4007		ER_REF_TO_RECURSIVE_WITH_TABLE_IN_DERIVED	Reference to recursive WITH table ‘%s’ in materialized derived
4008		ER_NOT_STANDARD_COMPLIANT_RECURSIVE	Restrictions imposed on recursive definitions are violated for table ‘%s’“R_WRONG_WINDOW_SPEC_NAME
4009		ER_WRONG_WINDOW_SPEC_NAME	Window specification with name ‘%s’ is not defined
4010		ER_DUP_WINDOW_NAME	Multiple window specifications with the same name ‘%s’
4011		ER_PARTITION_LIST_IN_REFERENCING_WINDOW_SPEC	Window specification referencing another one ‘%s’ cannot contain partition list
4012		ER_ORDER_LIST_IN_REFERENCING_WINDOW_SPEC	Referenced window specification ‘%s’ already contains order list
4013		ER_WINDOW_FRAME_IN_REFERENCED_WINDOW_SPEC	Referenced window specification ‘%s’ cannot contain window frame
4014		ER_BAD_COMBINATION_OF_WINDOW_FRAME_BOUND_SPECS	Unacceptable combination of window frame bound specifications
4015		ER_WRONG_PLACEMENT_OF_WINDOW_FUNCTION	Window function is allowed only in SELECT list and ORDER BY clause
4016		ER_WINDOW_FUNCTION_IN_WINDOW_SPEC	Window function is not allowed in window specification
4017		ER_NOT_ALLOWED_WINDOW_FRAME	Window frame is not allowed with ‘%s’
4018		ER_NO_ORDER_LIST_IN_WINDOW_SPEC	No order list in window specification for ‘%s’
4019		ER_RANGE_FRAME_NEEDS_SIMPLE_ORDERBY	RANGE-type frame requires ORDER BY clause with single sort key
4020		ER_WRONG_TYPE_FOR_ROWS_FRAME	Integer is required for ROWS-type frame
4021		ER_WRONG_TYPE_FOR_RANGE_FRAME	Numeric datatype is required for RANGE-type frame
4022		ER_FRAME_EXCLUSION_NOT_SUPPORTED	Frame exclusion is not supported yet
4023		ER_WINDOW_FUNCTION_DONT_HAVE_FRAME	This window function may not have a window frame
4024		ER_INVALID_NTILE_ARGUMENT	Argument of NTILE must be greater than 0

Error Code	SQL STATE	Error	Description
4025	23000	ER_CONSTRAINT_FAILED	CONSTRAINT %`s failed for %`-.192s.%`-.192s
4026		ER_EXPRESSION_IS_TOO_BIG	Expression in the %s clause is too big
4027		ER_ERROR_EVALUATING_EXPRESSION	Got an error evaluating stored expression %s
4028		ER_CALCULATING_DEFAULT_VALUE	Got an error when calculating default value for %`s
4029		ER_EXPRESSION_REFERS_TO_UNINIT_FIELD	Expression for field %`-.64s is referring to uninitialized field %`s
4030		ER_PARTITION_DEFAULT_ERROR	Only one DEFAULT partition allowed
4031		ER_REFERENCED_TRG_DOES_NOT_EXIST	Referenced trigger ‘%s’ for the given action time and event type does not exist
4032		ER_INVALID_DEFAULT_PARAM	Default/ignore value is not supported for such parameter usage
4033		ER_BINLOG_NON_SUPPORTED_BULK	Only row based replication supported for bulk operations
4034		ER_BINLOG_UNCOMPRESS_ERROR	Uncompress the compressed binlog failed
4035		ER_JSON_BAD_CHR	Broken JSON string in argument %d to function ‘%s’ at position %d
4036		ER_JSON_NOT_JSON_CHR	Character disallowed in JSON in argument %d to function ‘%s’ at position %d
4037		ER_JSON_EOS	Unexpected end of JSON text in argument %d to function ‘%s’
4038		ER_JSON_SYNTAX	Syntax error in JSON text in argument %d to function ‘%s’ at position %d
4039		ER_JSON_ESCAPING	Incorrect escaping in JSON text in argument %d to function ‘%s’ at position %d
4040		ER_JSON_DEPTH	Limit of %d on JSON nested structures depth is reached in argument %d to function ‘%s’ at position %d
4041		ER_JSON_PATH_EOS	Unexpected end of JSON path in argument %d to function ‘%s’
4042		ER_JSON_PATH_SYNTAX	Syntax error in JSON path in argument %d to function ‘%s’ at position %d
4043		ER_JSON_PATH_DEPTH	Limit of %d on JSON path depth is reached in argument %d to function ‘%s’ at position %d
4044		ER_JSON_PATH_NO_WILDCARD	Wildcards in JSON path not allowed in argument %d to function ‘%s’
4045		ER_JSON_PATH_ARRAY	JSON path should end with an array identifier in argument %d to function ‘%s’
4046		ER_JSON_ONE_OR_ALL	Argument 2 to function ‘%s’ must be “one” or “all”.
4047		ER_UNSUPPORT_COMPRESSED_TEMPORARY_TABLE	CREATE TEMPORARY TABLE is not allowed with ROW_FORMAT=COMPRESSED or KEY_BLOCK_SIZE.
4048		ER_GEOJSON_INCORRECT	Incorrect GeoJSON format specified for st_geomfromgeojson function.
4049		ER_GEOJSON_TOO_FEW_POINTS	Incorrect GeoJSON format - too few points for linestring specified.
4050		ER_GEOJSON_NOT_CLOSED	Incorrect GeoJSON format - polygon not closed.
4051		ER_JSON_PATH_EMPTY	Path expression ‘$’ is not allowed in argument %d to function ‘%s’.
4052		ER_SLAVE_SAME_ID	A slave with the same server_uuid/server_id as this slave has connected to the master

Error Code	SQL STATE	Error	Description
4053		ER_FLASHBACK_NOT_SUPPORTED	Flashback does not support %s %s
4054		ER_KEYS_OUT_OF_ORDER	Keys are out order during bulk load
4055		ER_OVERLAPPING_KEYS	Bulk load rows overlap existing rows
4056		ER_REQUIRE_ROW_BINLOG_FORMAT	Can't execute updates on master with binlog_format != ROW.
4057		ER_ISOLATION_MODE_NOT_SUPPORTED	MyRocks supports only READ COMMITTED and REPEATABLE READ isolation levels. Please change from current isolation level %s
4058		ER_ON_DUPLICATE_DISABLED	When unique checking is disabled in MyRocks, INSERT,UPDATE,LOAD statements with clauses that update or replace the key (i.e. INSERT ON DUPLICATE KEY UPDATE, REPLACE) are not allowed. Query: %s
4059		ER_UPDATES_WITH_CONSISTENT_SNAPSHOT	Can't execute updates when you started a transaction with START TRANSACTION WITH CONSISTENT [ROCKSDB] SNAPSHOT.
4060		ER_ROLLBACK_ONLY	This transaction was rolled back and cannot be committed. Only supported operation is to roll it back, so all pending changes will be discarded. Please restart another transaction.
4061		ER_ROLLBACK_TO_SAVEPOINT	MyRocks currently does not support ROLLBACK TO SAVEPOINT if modifying rows.
4062		ER_ISOLATION_LEVEL_WITH_CONSISTENT_SNAPSHOT	Only REPEATABLE READ isolation level is supported for START TRANSACTION WITH CONSISTENT SNAPSHOT in RocksDB Storage Engine.
4063		ER_UNSUPPORTED_COLLATION	Unsupported collation on string indexed column %s.%s Use binary collation (%s).
4064		ER_METADATA_INCONSISTENCY	Table '%s' does not exist, but metadata information exists inside MyRocks. This is a sign of data inconsistency. Please check if '%s.frm' exists, and try to restore it if it does not exist.
4065		ER_CF_DIFFERENT	Column family ('%s') flag (%d) is different from an existing flag (%d). Assign a new CF flag, or do not change existing CF flag.
4066		ER_RDB_TTL_DURATION_FORMAT	TTL duration (%s) in MyRocks must be an unsigned non-null 64-bit integer.
4067		ER_RDB_STATUS_GENERAL	Status error %d received from RocksDB: %s
4068		ER_RDB_STATUS_MSG	%s, Status error %d received from RocksDB: %s
4069		ER_RDB_TTL_UNSUPPORTED	TTL support is currently disabled when table has a hidden PK.
4070		ER_RDB_TTL_COL_FORMAT	TTL column (%s) in MyRocks must be an unsigned non-null 64-bit integer, exist inside the table, and have an accompanying ttl duration.
4071		ER_PER_INDEX_CF_DEPRECATED	The per-index column family option has been deprecated
4072		ER_KEY_CREATE_DURING_ALTER	MyRocks failed creating new key definitions during alter.
4073		ER_SK_POPULATE_DURING_ALTER	MyRocks failed populating secondary key during alter.
4074		ER_SUM_FUNC_WITH_WINDOW_FUNC_AS_ARG	Window functions can not be used as arguments to group functions.
4075		ER_NET_OK_PACKET_TOO_LARGE	OK packet too large

Error Code	SQL STATE	Error	Description
4076		ER_GEOJSON_EMPTY_COORDINATES	Incorrect GeoJSON format - empty 'coordinates' array.
4077		ER_MYROCKS_CANT_NOPAD_COLLATION	MyRocks doesn't currently support collations with "No pad" attribute.
4078		ER_ILLEGAL_PARAMETER_DATA_TYPES2_FOR_OPERATION	Illegal parameter data types %s and %s for operation '%s'
4079		ER_ILLEGAL_PARAMETER_DATA_TYPE_FOR_OPERATION	Illegal parameter data type %s for operation '%s'
4080		ER_WRONG_PARAMCOUNT_TO_CURSOR	Incorrect parameter count to cursor '%-.192s'
4081		ER_UNKNOWN_STRUCTURED_VARIABLE	Unknown structured system variable or ROW routine variable '%-.*s'
4082		ER_ROW_VARIABLE_DOES_NOT_HAVE_FIELD	Row variable '%-.192s' does not have a field '%-.192s'
4083		ER_END_IDENTIFIER_DOES_NOT_MATCH	END identifier '%-.192s' does not match '%-.192s'
4084		ER_SEQUENCE_RUN_OUT	Sequence '%-.64s.%-.64s' has run out
4085		ER_SEQUENCE_INVALID_DATA	Sequence '%-.64s.%-.64s' values are conflicting
4086		ER_SEQUENCE_INVALID_TABLE_STRUCTURE	Sequence '%-.64s.%-.64s' table structure is invalid (%s)
4087		ER_SEQUENCE_ACCESS_ERROR	Sequence '%-.64s.%-.64s' access error
4088		ER_SEQUENCE_BINLOG_FORMAT	Sequences requires binlog_format mixed or row
4089		ER_NOT_SEQUENCE	'%-.64s.%-.64s' is not a SEQUENCE
4090		ER_NOT_SEQUENCE2	'%-.192s' is not a SEQUENCE
4091		ER_UNKNOWN_SEQUENCES	Unknown SEQUENCE: '%-.300s'
4092		ER_UNKNOWN_VIEW	Unknown VIEW: '%-.300s'
4093		ER_WRONG_INSERT_INTO_SEQUENCE	Wrong INSERT into a SEQUENCE. One can only do single table INSERT into a sequence object (like with mysqldump). If you want to change the SEQUENCE, use ALTER SEQUENCE instead.
4094		ER_SP_STACK_TRACE	At line %u in %s
4095		ER_PACKAGE_ROUTINE_IN_SPEC_NOT_DEFINED_IN_BODY	Subroutine '%-.192s' is declared in the package specification but is not defined in the package body
4096		ER_PACKAGE_ROUTINE_FORWARD_DECLARATION_NOT_DEFINED	Subroutine '%-.192s' has a forward declaration but is not defined
4097		ER_COMPRESSED_COLUMN_USED_AS_KEY	Compressed column '%-.192s' can't be used in key specification
4098		ER_UNKNOWN_COMPRESSION_METHOD	Unknown compression method: %s

Error Code	SQL STATE	Error	Description
4099		ER_WRONG_NUMBER_OF_VALUES_IN_TVC	The used table value constructor has a different number of values

Error Code	SQLSTATE	Error	Description
4100		ER_FIELD_REFERENCE_IN_TVC	Field reference '%-.192s' can't be used in table value constructor
4101		ER_WRONG_TYPE_FOR_PERCENTILE_FUNC	Numeric datatype is required for %s function
4102		ER_ARGUMENT_NOT_CONSTANT	Argument to the %s function is not a constant for a partition
4103		ER_ARGUMENT_OUT_OF_RANGE	Argument to the %s function does not belong to the range [0,1]
4104		ER_WRONG_TYPE_OF_ARGUMENT	%s function only accepts arguments that can be converted to numerical types
4105		ER_NOT_AGGREGATE_FUNCTION	Aggregate specific instruction (FETCH GROUP NEXT ROW) used in a wrong context
4106		ER_INVALID_AGGREGATE_FUNCTION	Aggregate specific instruction(FETCH GROUP NEXT ROW) missing from the aggregate function
4107		ER_INVALID_VALUE_TO_LIMIT	Limit only accepts integer values
4108		ER_INVISIBLE_NOT_NULL_WITHOUT_DEFAULT	Invisible column %`s must have a default value
4109		ER_UPDATE_INFO_WITH_SYSTEM_VERSIONING	Rows matched: %ld Changed: %ld Inserted: %ld Warnings: %ld
4110		ER_VERS_FIELD_WRONG_TYPE	`% s must be of type %s for system-versioned table %` s
4111		ER_VERS_ENGINE_UNSUPPORTED	Transaction-precise system versioning for %`s is not supported
4112		ER_UNUSED_23	You should never see it
4113		ER_PARTITION_WRONG_TYPE	Wrong partitioning type, expected type: %`s
4114		WARN_VERS_PART_FULL	Versioned table % `s.%` s: last HISTORY partition (%`s) is out of %s, need more HISTORY partitions
4115		WARN_VERS_PARAMETERS	Maybe missing parameters: %s
4116		ER_VERS_DROP_PARTITION_INTERVAL	Can only drop oldest partitions when rotating by INTERVAL
4117		ER_UNUSED_25	You should never see it
4118		WARN_VERS_PART_NON_HISTORICAL	Partition %`s contains non-historical data
4119		ER_VERS_ALTER_NOT_ALLOWED	Not allowed for system-versioned % `s.%` s. Change @@system_versioning_alter_history to proceed with ALTER.
4120		ER_VERS_ALTER_ENGINE_PROHIBITED	Not allowed for system-versioned % `s.%` s. Change to/from native system versioning engine is not supported.
4121		ER_VERS_RANGE_PROHIBITED	SYSTEM_TIME range selector is not allowed
4122		ER_CONFLICTING_FOR_SYSTEM_TIME	Conflicting FOR SYSTEM_TIME clauses in WITH RECURSIVE
4123		ER_VERS_TABLE_MUST_HAVE_COLUMNS	Table %`s must have at least one versioned column
4124		ER_VERS_NOT_VERSIONED	Table %`s is not system-versioned
4125		ER_MISSING	Wrong parameters for %`s: missing '%s'
4126		ER_VERS_PERIOD_COLUMNS	PERIOD FOR SYSTEM_TIME must use columns % `s and %` s
4127		ER_PART_WRONG_VALUE	Wrong parameters for partitioned %`s: wrong value for '%s'

Error Code	SQLSTATE	Error	Description
4128		ER_VERS_WRONG_PARTS	Wrong partitions for %`s: must have at least one HISTORY and exactly one last CURRENT
4129		ER_VERS_NO_TRX_ID	TRX_ID %llu not found in `mysql.transaction_registry`
4130		ER_VERS_ALTER_SYSTEM_FIELD	Can not change system versioning field %`s
4131		ER_DROP_VERSIONING_SYSTEM_TIME_PARTITION	Can not DROP SYSTEM VERSIONING for table %`s partitioned BY SYSTEM_TIME
4132		ER_VERS_DB_NOT_SUPPORTED	System-versioned tables in the %`s database are not supported
4133		ER_VERS_TRT_IS_DISABLED	Transaction registry is disabled
4134		ER_VERS_DUPLICATE_ROW_START_END	Duplicate ROW %s column %`s
4135		ER_VERS_ALREADY_VERSIONED	Table %`s is already system-versioned
4136		ER_UNUSED_24	You should never see it
4137		ER_VERS_NOT_SUPPORTED	System-versioned tables do not support %s
4138		ER_VERS_TRX_PART_HISTORIC_ROW_NOT_SUPPORTED	Transaction-precise system-versioned tables do not support partitioning by ROW START or ROW END
4139		ER_INDEX_FILE_FULL	The index file for table '%-.192s' is full
4140		ER_UPDATED_COLUMN_ONLY_ONCE	The column % `s.%` s cannot be changed more than once in a single UPDATE statement
4141		ER_EMPTY_ROW_IN_TVC	Row with no elements is not allowed in table value constructor in this context
4142		ER_VERS_QUERY_IN_PARTITION	SYSTEM_TIME partitions in table %`s does not support historical query
4143		ER_KEY_DOESNT_SUPPORT	%s index %`s does not support this operation
4144		ER_ALTER_OPERATION_TABLE_OPTIONS_NEED_REBUILD	Changing table options requires the table to be rebuilt
4145		ER_BACKUP_LOCK_IS_ACTIVE	Can't execute the command as you have a BACKUP STAGE active
4146		ER_BACKUP_NOT_RUNNING	You must start backup with "BACKUP STAGE START"
4147		ER_BACKUP_WRONG_STAGE	Backup stage '%s' is same or before current backup stage '%s'
4148		ER_BACKUP_STAGE_FAILED	Backup stage '%s' failed
4149		ER_BACKUP_UNKNOWN_STAGE	Unknown backup stage: '%s'. Stage should be one of START, FLUSH, BLOCK_DDL, BLOCK_COMMIT or END
4150		ER_USER_IS_BLOCKED	User is blocked because of too many credential errors; unblock with 'FLUSH PRIVILEGES'
4151		ER_ACCOUNT_HAS_BEEN_LOCKED	Access denied, this account is locked
4152		ER_PERIOD_TEMPORARY_NOT_ALLOWED	Application-time period table cannot be temporary
4153		ER_PERIOD_TYPES_MISMATCH	Fields of PERIOD FOR %`s have different types
4154		ER_MORE_THAN_ONE_PERIOD	Cannot specify more than one application-time period
4155		ER_PERIOD_FIELD_WRONG_ATTRIBUTES	Period field %`s cannot be %s
4156		ER_PERIOD_NOT_FOUND	Period %`s is not found in table
4157		ER_PERIOD_COLUMNS_UPDATED	Column % `s used in period %` s specified in update SET list
4158		ER_PERIOD_CONSTRAINT_DROP	Can't DROP CONSTRAINT `%s` . Use DROP PERIOD `%s` for this

Error Code	SQLSTATE	Error	Description
4159	42000 S1009	ER_TOO_LONG_KEYPART	Specified key part was too long; max key part length is %u bytes
4160		ER_TOO_LONG_DATABASE_COMMENT	Comment for database '%-.64s' is too long (max = %u)
4161		ER_UNKNOWN_DATA_TYPE	Unknown data type: '%-.64s'
4162		ER_UNKNOWN_OPERATOR	Operator does not exists: '%-.128s'
4163		ER_WARN_HISTORY_ROW_START_TIME	Table `%s.%s` history row start '%s' is later than row end '%s'
4164		ER_PART_STARTS_BEYOND_INTERVAL	%`s: STARTS is later than query time, first history partition may exceed INTERVAL value
4165		ER_GALERA_REPLICATION_NOT_SUPPORTED	DDL-statement is forbidden as table storage engine does not support Galera replication
4166	HY000	ER_LOAD_INFILE_CAPABILITY_DISABLED	The used command is not allowed because the MariaDB server or client has disabled the local infile capability
4167		ER_NO_SECURE_TRANSPORTS_CONFIGURED	No secure transports are configured, unable to set –require_secure_transport=ON
4168		ER_SLAVE_IGNORED_SHARED_TABLE	Slave SQL thread ignored the '%s' because table is shared
4169		ER_NO_AUTOINCREMENT_WITH_UNIQUE	AUTO_INCREMENT column `%s cannot be used in the UNIQUE index %s`
4170		ER_KEY_CONTAINS_PERIOD_FIELDS	Key `%s cannot explicitly include column %s`
4171		ER_KEY_CANT_HAVE_WITHOUT_OVERLAPS	Key %`s cannot have WITHOUT OVERLAPS
4172		ER_NOT_ALLOWED_IN_THIS_CONTEXT	'%-.128s' is not allowed in this context
4173		ER_DATA_WAS_COMMITED_UNDER_ROLLBACK	Engine %s does not support rollback. Changes were committed during rollback call
4174		ER_PK_INDEX_CANT_BE_IGNORED	A primary key cannot be marked as IGNORE
4175		ER_BINLOG_UNSAFE_SKIP_LOCKED	SKIP LOCKED makes this statement unsafe
4176		ER_JSON_TABLE_ERROR_ON_FIELD	Field '%s' can't be set for JSON_TABLE '%s'.
4177		ER_JSON_TABLE_ALIAS_REQUIRED	Every table function must have an alias.
4178		ER_JSON_TABLE_SCALAR_EXPECTED	Can't store an array or an object in the scalar column '%s' of JSON_TABLE '%s'.
4179		ER_JSON_TABLE_MULTIPLE_MATCHES	Can't store multiple matches of the path in the column '%s' of JSON_TABLE '%s'.
4180		ER_WITH_TIES_NEEDS_ORDER	FETCH … WITH TIES requires ORDER BY clause to be present
4181		ER_REMOVED_ORPHAN_TRIGGER	Dropped orphan trigger '%-.64s', originally created for table: '%-.192s'
4182		ER_STORAGE_ENGINE_DISABLED	Storage engine %s is disabled
4183		WARN_SFORMAT_ERROR	SFORMAT error: %s
4184		ER_PARTITION_CONVERT_SUBPARTITIONED	Convert partition is not supported for subpartitioned table.
4185		ER_PROVIDER_NOT_LOADED	MariaDB tried to use the %s, but its provider plugin is not loaded
4186		ER_JSON_HISTOGRAM_PARSE_FAILED	Failed to parse histogram for table %s.%s: %s at offset %d.
4187		ER_SF_OUT_INOUT_ARG_NOT_ALLOWED	OUT or INOUT argument %d for function %s is not allowed here
4188		ER_INCONSISTENT_SLAVE_TEMP_TABLE	Replicated query '%s' table `%s.%s` can not be temporary

Error Code	SQLSTATE	Error	Description
4189		ER_VERS_HIST_PART_FAILED	Versioned table %`s.%`s: adding HISTORY partition(s) failed
4190		WARN_OPTION_CHANGING	%s is implicitly changing the value of '%s' from '%s' to '%s'
4191		ER_CM_OPTION_MISSING_REQUIREMENT	CHANGE MASTER TO option '%s=%s' is missing requirement %s
4192		ER_SLAVE_STATEMENT_TIMEOUT	Slave log event execution was interrupted (slave_max_statement_time exceeded)
4193		ER_JSON_INVALID_VALUE_FOR_KEYWORD	Invalid value for keyword %s
4194		ER_JSON_SCHEMA_KEYWORD_UNSUPPORTED	%s keyword is not supported
4195		ER_JSON_NO_VARIABLE_SCHEMA	Variable schema is not supported.
4196		ER_PSEUDO_THREAD_ID_OVERWRITE	Pseudo thread id should not be modified by the client as it will be overwritten
4197		ER_SEQUENCE_TABLE_HAS_WRONG_NUMBER_OF_COLUMNS	Wrong number of columns
4198		ER_SEQUENCE_TABLE_CANNOT_HAVE_ANY_KEYS	Sequence tables cannot have any keys
4199		ER_SEQUENCE_TABLE_CANNOT_HAVE_ANY_CONSTRAINTS	Sequence tables cannot have any constraints

Error Code	SQLSTATE	Error	Description
4200		ER_SEQUENCE_TABLE_ORDER_BY	ORDER BY
4201		ER_VARIABLE_IGNORED	The variable '%s' is ignored. It only exists for compatibility with old installations and will be removed in a future release
4202		ER_INCORRECT_COLUMN_NAME_COUNT	Incorrect column name count for derived table.
4203		WARN_SORTING_ON_TRUNCATED_LENGTH	Values were longer than max_sort_length. Sorting used only the first bytes.
4204		ER_VECTOR_BINARY_FORMAT_INVALID	Invalid binary vector format. Must use IEEE standard float representation in little-endian format. Use VEC_FromText() to generate it.
4205		ER_VECTOR_FORMAT_INVALID	Invalid vector format at offset: %d for '%-.100s'. Must be a valid JSON array of numbers.
4206		ER_VEC_DISTANCE_TYPE	Cannot determine distance type for VEC_DISTANCE, index is not found
4221		ER_UNRESOLVED_TABLE_HINT_NAME	Unresolved table name %s for %s hint
4222		ER_UNRESOLVED_INDEX_HINT_NAME	Unresolved index name %s for %s hint
4223		ER_HINTS_INSIDE_VIEWS_NOT_SUPPORTED	Optimizer hints are not supported inside view definitions
4224		ER_WARN_MALFORMED_HINT	Hint %s is ignored as malformed
4225		ER_WARN_HINTS_ON_INSERT_PART_OF_INSERT_SELECT	Optimizer hints at the INSERT part of a INSERT..SELECT statement are not supported
4226		ER_INIT_SLAVE_ERROR	Slave SQL thread aborted. Can't execute init_slave query due to error code

Operating System Error Codes

Below is a partial list of more common Linux and Windows operating system error codes.

Linux Error Codes

The perror tool can be used to find the error message which is associated with a given error code.

Number	Error Code	Description
1	EPERM	Operation not permitted
2	ENOENT	No such file or directory
3	ESRCH	No such process
4	EINTR	Interrupted system call
5	EIO	I/O error
6	ENXIO	No such device or address
7	E2BIG	Argument list too long
8	ENOEXEC	Exec format error
9	EBADF	Bad file number
10	ECHILD	No child processes
11	EAGAIN	Try again
12	ENOMEM	Out of memory
13	EACCES	Permission denied
14	EFAULT	Bad address
15	ENOTBLK	Block device required
16	EBUSY	Device or resource busy
17	EEXIST	File exists
18	EXDEV	Cross-device link
19	ENODEV	No such device
20	ENOTDIR	Not a directory
21	EISDIR	Is a directory
22	EINVAL	Invalid argument
23	ENFILE	File table overflow
24	EMFILE	Too many open files
25	ENOTTY	Not a typewriter
26	ETXTBSY	Text file busy
27	EFBIG	File too large
28	ENOSPC	No space left on device
29	ESPIPE	Illegal seek
30	EROFS	Read-only file system
31	EMLINK	Too many links
32	EPIPE	Broken pipe
33	EDOM	Math argument out of domain of func

Number	Error Code	Description
34	ERANGE	Math result not representable
35	EDEADLK	Resource deadlock would occur
36	ENAMETOOLONG	File name too long
37	ENOLCK	No record locks available
38	ENOSYS	Function not implemented
39	ENOTEMPTY	Directory not empty
40	ELOOP	Too many symbolic links encountered
42	ENOMSG	No message of desired type
43	EIDRM	Identifier removed
44	ECHRNG	Channel number out of range
45	EL2NSYNC	Level 2 not synchronized
46	EL3HLT	Level 3 halted
47	EL3RST	Level 3 reset
48	ELNRNG	Link number out of range
49	EUNATCH	Protocol driver not attached
50	ENOCSI	No CSI structure available
51	EL2HLT	Level 2 halted
52	EBADE	Invalid exchange
53	EBADR	Invalid request descriptor
54	EXFULL	Exchange full
55	ENOANO	No anode
56	EBADRQC	Invalid request code
57	EBADSLT	Invalid slot
59	EBFONT	Bad font file format
60	ENOSTR	Device not a stream
61	ENODATA	No data available
62	ETIME	Timer expired
63	ENOSR	Out of streams resources
64	ENONET	Machine is not on the network
65	ENOPKG	Package not installed
66	EREMOTE	Object is remote
67	ENOLINK	Link has been severed
68	EADV	Advertise error
69	ESRMNT	Srmount error
70	ECOMM	Communication error on send
71	EPROTO	Protocol error
72	EMULTIHOP	Multihop attempted
73	EDOTDOT	RFS specific error
74	EBADMSG	Not a data message

Number	Error Code	Description
75	EOVERFLOW	Value too large for defined data type
76	ENOTUNIQ	Name not unique on network
77	EBADFD	File descriptor in bad state
78	EREMCHG	Remote address changed
79	ELIBACC	Can not access a needed shared library
80	ELIBBAD	Accessing a corrupted shared library
81	ELIBSCN	.lib section in a.out corrupted
82	ELIBMAX	Attempting to link in too many shared libraries
83	ELIBEXEC	Cannot exec a shared library directly
84	EILSEQ	Illegal byte sequence
85	ERESTART	Interrupted system call should be restarted
86	ESTRPIPE	Streams pipe error
87	EUSERS	Too many users
88	ENOTSOCK	Socket operation on non-socket
89	EDESTADDRREQ	Destination address required
90	EMSGSIZE	Message too long
91	EPROTOTYPE	Protocol wrong type for socket
92	ENOPROTOOPT	Protocol not available
93	EPROTONOSUPPORT	Protocol not supported
94	ESOCKTNOSUPPORT	Socket type not supported
95	EOPNOTSUPP	Operation not supported on transport endpoint
96	EPFNOSUPPORT	Protocol family not supported
97	EAFNOSUPPORT	Address family not supported by protocol
98	EADDRINUSE	Address already in use
99	EADDRNOTAVAIL	Cannot assign requested address
100	ENETDOWN	Network is down
101	ENETUNREACH	Network is unreachable
102	ENETRESET	Network dropped connection because of reset
103	ECONNABORTED	Software caused connection abort
104	ECONNRESET	Connection reset by peer
105	ENOBUFS	No buffer space available
106	EISCONN	Transport endpoint is already connected
107	ENOTCONN	Transport endpoint is not connected
108	ESHUTDOWN	Cannot send after transport endpoint shutdown
109	ETOOMANYREFS	Too many references: cannot splice
110	ETIMEDOUT	Connection timed out
111	ECONNREFUSED	Connection refused
112	EHOSTDOWN	Host is down
113	EHOSTUNREACH	No route to host

Number	Error Code	Description
114	EALREADY	Operation already in progress
115	EINPROGRESS	Operation now in progress
116	ESTALE	Stale NFS file handle
117	EUCLEAN	Structure needs cleaning
118	ENOTNAM	Not a XENIX named type file
119	ENAVAIL	No XENIX semaphores available
120	EISNAM	Is a named type file
121	EREMOTEIO	Remote I/O error
122	EDQUOT	Quota exceeded
123	ENOMEDIUM	No medium found
124	EMEDIUMTYPE	Wrong medium type
125	ECANCELED	Operation Canceled
126	ENOKEY	Required key not available
127	EKEYEXPIRED	Key has expired
128	EKEYREVOKED	Key has been revoked
129	EKEYREJECTED	Key was rejected by service
130	EOWNERDEAD	Owner died
131	ENOTRECOVERABLE	State not recoverable

Windows Error Codes

> **Note:**
>
> For a complete list, see ms681381.aspx

Number	Error Code	Description
1	ERROR_INVALID_FUNCTION	Incorrect function.
2	ERROR_FILE_NOT_FOUND	The system cannot find the file specified.
3	ERROR_PATH_NOT_FOUND	The system cannot find the path specified.
4	ERROR_TOO_MANY_OPEN_FILES	The system cannot open the file.
5	ERROR_ACCESS_DENIED	Access is denied.
6	ERROR_INVALID_HANDLE	The handle is invalid.
7	ERROR_ARENA_TRASHED	The storage control blocks were destroyed.
8	ERROR_NOT_ENOUGH_MEMORY	Not enough storage is available to process this command.
9	ERROR_INVALID_BLOCK	The storage control block address is invalid.
10	ERROR_BAD_ENVIRONMENT	The environment is incorrect.
11	ERROR_BAD_FORMAT	An attempt was made to load a program with an incorrect format.
12	ERROR_INVALID_ACCESS	The access code is invalid.
13	ERROR_INVALID_DATA	The data is invalid.
14	ERROR_OUTOFMEMORY	Not enough storage is available to complete this operation.
15	ERROR_INVALID_DRIVE	The system cannot find the drive specified.

Number	Error Code	Description
16	ERROR_CURRENT_DIRECTORY	The directory cannot be removed.
17	ERROR_NOT_SAME_DEVICE	The system cannot move the file to a different disk drive.
18	ERROR_NO_MORE_FILES	There are no more files.
19	ERROR_WRITE_PROTECT	The media is write protected.
20	ERROR_BAD_UNIT	The system cannot find the device specified.
21	ERROR_NOT_READY	The device is not ready.
22	ERROR_BAD_COMMAND	The device does not recognize the command.
23	ERROR_CRC	Data error (cyclic redundancy check).
24	ERROR_BAD_LENGTH	The program issued a command but the command length is incorrect.
25	ERROR_SEEK	The drive cannot locate a specific area or track on the disk.
26	ERROR_NOT_DOS_DISK	The specified disk or diskette cannot be accessed.
27	ERROR_SECTOR_NOT_FOUND	The drive cannot find the sector requested.
28	ERROR_OUT_OF_PAPER	The printer is out of paper.
29	ERROR_WRITE_FAULT	The system cannot write to the specified device.
30	ERROR_READ_FAULT	The system cannot read from the specified device.
31	ERROR_GEN_FAILURE	A device attached to the system is not functioning.
32	ERROR_SHARING_VIOLATION	The process cannot access the file because it is being used by another process.
33	ERROR_LOCK_VIOLATION	The process cannot access the file because another process has locked a portion of the file.
34	ERROR_WRONG_DISK	The wrong diskette is in the drive. Insert %2 (Volume Serial Number: %3) into drive %1.
36	ERROR_SHARING_BUFFER_EXCEEDED	Too many files opened for sharing.
38	ERROR_HANDLE_EOF	Reached the end of the file.
39	ERROR_HANDLE_DISK_FULL	The disk is full.
87	ERROR_INVALID_PARAMETER	The parameter is incorrect.
112	ERROR_DISK_FULL	The disk is full.
123	ERROR_INVALID_NAME	The file name, directory name, or volume label syntax is incorrect.
1450	ERROR_NO_SYSTEM_RESOURCES	Insufficient system resources exist to complete the requested service.

MariaDB Error Codes 1000 to 1099

- Error 1000: hashchk
- Error 1001: isamchk
- Error 1002: NO
- Error 1003: YES
- Error 1004: Can’t create file
- Error 1005: Can’t create table
- Error 1006: Can’t create database
- Error 1007: Can’t create database, database exists

- Error 1008: Can’t drop database; database doesn’t exist
- Error 1009: Error dropping database (can’t delete)
- Error 1010: Error dropping database (can’t rmdir)
- Error 1011: Error on delete of
- Error 1012: Can’t read record in system table
- Error 1013: Can’t get status of
- Error 1014: Can’t get working directory
- Error 1015: Can’t lock file
- Error 1016: Can’t open file
- Error 1017: Can’t find file
- Error 1018: Can’t read dir of
- Error 1019: Can’t change dir to
- Error 1020: Record has changed since last read in table
- Error 1021: Disk full (%s); waiting for someone to free some space
- Error 1022: Can’t write; duplicate key in table
- Error 1023: Error on close of
- Error 1024: Error reading file
- Error 1025: Error on rename of
- Error 1026: Error writing file
- Error 1027: is locked against change
- Error 1028: Sort aborted
- Error 1029: View doesn’t exist for
- Error 1030: Got error from storage engine
- Error 1031: Table storage engine doesn’t have this option
- Error 1032: Can’t find record in
- Error 1033: Incorrect information in file
- Error 1034: Incorrect key file for table; try to repair it
- Error 1035: Old key file for table; repair it!
- Error 1036: Table is read only
- Error 1037: Out of memory; restart server and try again
- Error 1038: Out of sort memory, consider increasing server sort buffer size
- Error 1039: Unexpected EOF found when reading file
- Error 1040: Too many connections
- Error 1041: Out of memory
- Error 1042: Can’t get hostname for your address
- Error 1043: Bad handshake
- Error 1044: Access denied for user
- Error 1045: Access denied for user (using password)
- Error 1046: No database selected
- Error 1047: Unknown command
- Error 1048: Column cannot be null
- Error 1049: Unknown database
- Error 1050: Table already exists
- Error 1051: Unknown table
- Error 1052: Column is ambiguous

- Error 1053: Server shutdown in progress
- Error 1054: Unknown column
- Error 1055: isn’t in GROUP BY
- Error 1056: Can’t group on
- Error 1057: Statement has sum functions and columns in same statement
- Error 1058: Column count doesn’t match value count
- Error 1059: Identifier name is too long
- Error 1060: Duplicate column name
- Error 1061: Duplicate key name
- Error 1062: Duplicate entry for key
- Error 1063: Incorrect column specifier for column
- Error 1064: near at line
- Error 1065: Query was empty
- Error 1066: Not unique table/alias
- Error 1067: Invalid default value for
- Error 1068: Multiple primary key defined
- Error 1069: Too many keys specified; max keys allowed
- Error 1070: Too many key parts specified; max parts allowed
- Error 1071: Specified key was too long; max key length is
- Error 1072: Key column doesn’t exist in table
- Error 1073: BLOB column can’t be used in key specification with the used table type
- Error 1074: Column length too big for column; use BLOB or TEXT instead
- Error 1075: Incorrect table definition; there can be only one auto column and it must be defined as
- Error 1076: ready for connections
- Error 1077: Normal shutdown
- Error 1078: Got signal. Aborting!
- Error 1079: Shutdown complete
- Error 1080: Forcing close of thread
- Error 1081: Can’t create IP socket
- Error 1082: Table has no index like the one used in CREATE INDEX; recreate the table
- Error 1083: Field separator argument is not what is expected; check the manual
- Error 1084: You can’t use fixed rowlength with BLOBs; please use ‘fields terminated by’
- Error 1085: The file must be in the database directory or be readable by all
- Error 1086: File already exists
- Error 1087: Records Deleted Skipped Warnings
- Error 1088: Records Duplicates
- Error 1089: Incorrect prefix key; the used key part isn’t a string, the used length is longer than t
- Error 1090: You can’t delete all columns with ALTER TABLE; use DROP TABLE instead
- Error 1091: Can’t DROP; check that column/key exists
- Error 1092: Records Duplicates Warnings
- Error 1093: You can’t specify target table for update in FROM clause
- Error 1094: Unknown thread id
- Error 1095: You are not owner of thread
- Error 1096: No tables used
- Error 1097: Too many strings for column and SET

- Error 1098: Can’t generate a unique log-filename
- Error 1099: Table was locked with a READ lock and can’t be updated

Error 1000: hashchk

Error Code	SQLSTATE	Error	Description
1000	HY000	ER_HASHCHK	hashchk

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1001: isamchk

Error Code	SQLSTATE	Error	Description
1001	HY000	ER_NISAMCHK	isamchk

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1002: NO

Error Code	SQLSTATE	Error	Description
1002	HY000	ER_NO	NO

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1003: YES

Error Code	SQLSTATE	Error	Description
1003	HY000	ER_YES	YES

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1004: Can’t create file

Error Code	SQLSTATE	Error	Description
1004	HY000	ER_CANT_CREATE_FILE	Can’t create file ‘%s’ (errno: %d)

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1005: Can’t create table

Error Code	SQLSTATE	Error	Description
1005	HY000	ER_CANT_CREATE_TABLE	Can’t create table ‘%s’ (errno: %d)

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1006: Can’t create database

Error Code	SQLSTATE	Error	Description
1006	`HY000`	`ER_CANT_CREATE_DB`	Can’t create database ‘%s’ (errno: %d)

Possible Causes and Solutions

Insufficient Disk Space

The server has insufficient free disk space to create the database. Free up space and retry.

File permissions

There may be a file permission issue on the data directories. Check both the user and group permissions and set accordingly.

This page is licensed: CC BY-SA / Gnu FDL

Error 1007: Can’t create database, database exists

Error Code	SQLSTATE	Error	Description
1007	HY000	ER_DB_CREATE_EXISTS	Can’t create database ‘%s’; database exists

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1008: Can’t drop database; database doesn’t exist

Error Code	SQLSTATE	Error	Description
1008	HY000	ER_DB_DROP_EXISTS	Can’t drop database ‘%s’; database doesn’t exist

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1009: Error dropping database (can’t delete)

Error Code	SQLSTATE	Error	Description
1009	HY000	ER_DB_DROP_DELETE	Error dropping database (can’t delete ‘%s’, errno: %d)

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1010: Error dropping database (can’t rmdir)

Error Code	SQLSTATE	Error	Description
1010	HY000	ER_DB_DROP_RMDIR	Error dropping database (can’t rmdir ‘%s’, errno: %d)

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1011: Error on delete of

Error Code	SQLSTATE	Error	Description
1011	HY000	ER_CANT_DELETE_FILE	Error on delete of ‘%s’ (errno: %d)

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1012: Can’t read record in system table

Error Code	SQLSTATE	Error	Description
1012	HY000	ER_CANT_FIND_SYSTEM_REC	Can’t read record in system table

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1013: Can’t get status of

Error Code	SQLSTATE	Error	Description
1013	HY000	ER_CANT_GET_STAT	Can’t get status of ‘%s’ (errno: %d)

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1014: Can’t get working directory

Error Code	SQLSTATE	Error	Description
1014	HY000	ER_CANT_GET_WD	Can’t get working directory (errno: %d)

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1015: Can’t lock file

Error Code	SQLSTATE	Error	Description
1015	HY000	ER_CANT_LOCK	Can’t lock file (errno: %d)

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1016: Can’t open file

Error Code	SQLSTATE	Error	Description
1016	HY000	ER_CANT_OPEN_FILE	Can’t open file: ‘%s’ (errno: %d)

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1017: Can't find file

Error Code	SQLSTATE	Error	Description
1017	HY000	ER_FILE_NOT_FOUND	Can't find file: '%s' (errno: %d)

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1018: Can't read dir of

Error Code	SQLSTATE	Error	Description
1018	HY000	ER_CANT_READ_DIR	Can't read dir of '%s' (errno: %d)

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1019: Can't change dir to

Error Code	SQLSTATE	Error	Description
1019	HY000	ER_CANT_SET_WD	Can't change dir to '%s' (errno: %d)

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1020: Record has changed since last read in table

Error Code	SQLSTATE	Error	Description
1020	HY000	ER_CHECKREAD	Record has changed since last read in table '%s'

> This error is more common in MariaDB 11.8 and later due to changes in snapshot isolation behavior. For more information, see the upgrade guide and innodb_snapshot_isolation pages.

Possible Causes and Solutions

When InnoDB returns this error, it results in a **full transaction rollback**, not just a statement rollback. For that reason, this error should be treated similarly to a deadlock (ER_LOCK_DEADLOCK) or a lock wait timeout (ER_LOCK_WAIT_TIMEOUT).

Try restarting the transaction.

Error 1021: Disk full (%s); waiting for someone to free some space

Error Code	SQLSTATE	Error	Description
1021	HY000	ER_DISK_FULL	Disk full (%s); waiting for someone to free some space…

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1022: Can’t write; duplicate key in table

Error Code	SQLSTATE	Error	Description
1022	23000	ER_DUP_KEY	Can’t write; duplicate key in table ‘%s’

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1023: Error on close of

Error Code	SQLSTATE	Error	Description
1023	HY000	ER_ERROR_ON_CLOSE	Error on close of ‘%s’ (errno: %d)

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1024: Error reading file

Error Code	SQLSTATE	Error	Description
1024	HY000	ER_ERROR_ON_READ	Error reading file ‘%s’ (errno: %d)

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1025: Error on rename of

Error Code	SQLSTATE	Error	Description
1025	HY000	ER_ERROR_ON_RENAME	Error on rename of ‘%s’ to ‘%s’ (errno: %d)

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1026: Error writing file

Error Code	SQLSTATE	Error	Description
1026	HY000	ER_ERROR_ON_WRITE	Error writing file ‘%s’ (errno: %d)

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1027: is locked against change

Error Code	SQLSTATE	Error	Description
1027	HY000	ER_FILE_USED	‘%s’ is locked against change

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1028: Sort aborted

Error Code	SQLSTATE	Error	Description
1028	HY000	ER_FILSORT_ABORT	Sort aborted

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1029: View doesn't exist for

Error Code	SQLSTATE	Error	Description
1029	HY000	ER_FORM_NOT_FOUND	View '%s' doesn't exist for '%s'

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1030: Got error from storage engine

Error Code	SQLSTATE	Error	Description
1030	HY000	ER_GET_ERRNO	Got error %d from storage engine

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1031: Table storage engine doesn't have this option

Error Code	SQLSTATE	Error	Description
1031	HY000	ER_ILLEGAL_HA	Table storage engine for '%s' doesn't have this option

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1032: Can't find record in

Error Code	SQLSTATE	Error	Description
1032	HY000	ER_KEY_NOT_FOUND	Can't find record in '%s'

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1033: Incorrect information in file

Error Code	SQLSTATE	Error	Description
1033	HY000	ER_NOT_FORM_FILE	Incorrect information in file: '%s'

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1034: Incorrect key file for table; try to repair it

Error Code	SQLSTATE	Error	Description
1034	HY000	ER_NOT_KEYFILE	Incorrect key file for table '%s'; try to repair it

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1035: Old key file for table; repair it!

Error Code	SQLSTATE	Error	Description
1035	HY000	ER_OLD_KEYFILE	Old key file for table '%s'; repair it!

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1036: Table is read only

Error Code	SQLSTATE	Error	Description
1036	HY000	ER_OPEN_AS_READONLY	Table '%s' is read only

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1037: Out of memory; restart server and try again

Error Code	SQLSTATE	Error	Description
1038	HY001	ER_OUT_OF_SORTMEMORY	Out of sort memory, consider increasing server sort buffer size

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1038: Out of sort memory, consider increasing server sort buffer size

Error Code	SQLSTATE	Error	Description
1038	HY001	ER_OUT_OF_SORTMEMORY	Out of sort memory, consider increasing server sort buffer size

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1039: Unexpected EOF found when reading file

Error Code	SQLSTATE	Error	Description
1039	HY000	ER_UNEXPECTED_EOF	Unexpected EOF found when reading file '%s' (Errno: %d)

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1040: Too many connections

Error Code	SQLSTATE	Error	Description
1040	08004	ER_CON_COUNT_ERROR	Too many connections

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1041: Out of memory

Error Code	SQLSTATE	Error	Description
1041	HY000	ER_OUT_OF_RESOURCES	Out of memory; check if mysqld or some other process uses all available memory; if not, you may have to use ‘ulimit’ to allow mysqld to use more memory or you can add more swap space

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1042: Can’t get hostname for your address

Error Code	SQLSTATE	Error	Description
1042	08S01	ER_BAD_HOST_ERROR	Can’t get hostname for your address

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1043: Bad handshake

Error Code	SQLSTATE	Error	Description
1043	08S01	ER_HANDSHAKE_ERROR	Bad handshake

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1044: Access denied for user

Error Code	SQLSTATE	Error	Description
1044	42000	ER_DBACCESS_DENIED_ERROR	Access denied for user ‘%s’@‘%s’ to database ‘%s’

Possible Causes and Solutions

The user is trying to access a database/schema they do not have access to. See Troubleshooting Connection Issues for more, as well as GRANT for details on setting permissions.

See Also

- When access_denied_errors status variable is incremented

This page is licensed: CC BY-SA / Gnu FDL

Error 1045: Access denied for user (using password)

Error Code	SQLSTATE	Error	Description
1045	28000	ER_ACCESS_DENIED_ERROR	Access denied for user ‘%s’@‘%s’ (using password: %s)

Possible Causes and Solutions

The user/password combination does not exist or the user does not have privileges to the given database. See Troubleshooting Connection Issues for more, as well as GRANT for details on setting permissions.

Error 1046: No database selected

Error Code	SQLSTATE	Error	Description
1046	3D000	ER_NO_DB_ERROR	No database selected

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1047: Unknown command

Error Code	SQLSTATE	Error	Description
1047	08S01	ER_UNKNOWN_COM_ERROR	Unknown command

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1048: Column cannot be null

Error Code	SQLSTATE	Error	Description
1048	23000	ER_BAD_NULL_ERROR	Column ‘%s’ cannot be null

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1049: Unknown database

Error Code	SQLSTATE	Error	Description
1049	42000	ER_BAD_DB_ERROR	Unknown database ‘%s’

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1050: Table already exists

Error Code	SQLSTATE	Error	Description
1050	42S01	ER_TABLE_EXISTS_ERROR	Table ‘%s’ already exists

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1051: Unknown table

Error Code	SQLSTATE	Error	Description
1051	42S02	ER_BAD_TABLE_ERROR	Unknown table ‘%s’

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1052: Column is ambiguous

Error Code	SQLSTATE	Error	Description
1052	23000	ER_NON_UNIQ_ERROR	Column ‘%s’ in %s is ambiguous

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1053: Server shutdown in progress

Error Code	SQLSTATE	Error	Description
1053	08S01	ER_SERVER_SHUTDOWN	Server shutdown in progress

Possible Causes and Solutions

Error 1061: Duplicate key name

Error Code	SQLSTATE	Error	Description
1061	42000	ER_DUP_KEYNAME	Duplicate key name ‘%s’

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1062: Duplicate entry for key

Error Code	SQLSTATE	Error	Description
1062	23000	ER_DUP_ENTRY	Duplicate entry ‘%s’ for key %d

Possible Causes and Solutions

This error occurs when a key that requires a unique value (unique or primary) instead receives a duplicate. For example:

```
CREATE TABLE t1 (
  id INT AUTO_INCREMENT PRIMARY KEY,
  f VARCHAR(10) UNIQUE
);

INSERT INTO t1 (f) VALUES ('a'),('b');

SELECT * FROM t1;
+----+------+
| id | f    |
+----+------+
|  1 | a    |
|  2 | b    |
+----+------+

INSERT INTO t1 (f) VALUES ('b'),('c');
ERROR 1062 (23000): Duplicate entry 'b' for key 'f'
```

Solve the error by either not attempting to insert a duplicate value, or not requiring the key to be unique. For example, the below replaces the unique index with an index permitting duplicates:

```
ALTER TABLE t1 DROP INDEX f, ADD INDEX (f);

INSERT INTO t1 (f) VALUES ('b'),('c');

SELECT * FROM t1;
+----+------+
| id | f    |
+----+------+
|  1 | a    |
|  2 | b    |
|  3 | b    |
|  4 | c    |
+----+------+
```

Error 1065: Query was empty

Error Code	SQLSTATE	Error	Description
1065	42000	ER_EMPTY_QUERY	Query was empty

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1066: Not unique table/alias

Error Code	SQLSTATE	Error	Description
1066	42000	ER_NONUNIQ_TABLE	Not unique table/alias: ‘%s’

Possible Causes and Solutions

In order to avoid ambiguity, a table name or alias must uniquely identify an object. There are many situations where this could occur.

For example, HANDLER statements use unqualified table names, requiring the use of an alias in certain contexts. For example:

```
CREATE TABLE t1 (f1 INT);

INSERT INTO t1 VALUES (1),(2),(3);

HANDLER t1 OPEN;

HANDLER t1 READ NEXT;
+------+
| f1   |
+------+
|    1 |
+------+

HANDLER t1 READ NEXT;
+------+
| f1   |
+------+
|    2 |
+------+
```

In the previous example, the HANDLER was opened with the t1 table name. Since HANDLERs use unqualified table names, trying to access another table with this same name, even though it’s in another database, will result in ambiguity. An alias needs to be used to avoid the ambiguity:

```
CREATE DATABASE db_new;

CREATE TABLE db_new.t1 (id INT);

INSERT INTO db_new.t1 VALUES (4),(5),(6);

HANDLER db_new.t1 OPEN;
ERROR 1066 (42000): Not unique table/alias: 't1'

HANDLER db_new.t1 OPEN AS db_new_t1;

HANDLER db_new_t1 READ NEXT LIMIT 3;
+------+
| id   |
+------+
|    4 |
|    5 |
|    6 |
+------+
```

Error 1067: Invalid default value for

Error Code	SQLSTATE	Error	Description
1067	42000	ER_INVALID_DEFAULT	Invalid default value for ‘%s’

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1068: Multiple primary key defined

Error Code	SQLSTATE	Error	Description
1068	42000	ER_MULTIPLE_PRI_KEY	Multiple primary key defined

Possible Causes and Solutions

No more than one primary key can be defined per table. Attempting to define more in a single table will result in this error. For example:

```
CREATE TABLE t1(
    c1 INT NOT NULL AUTO_INCREMENT,
    c2 INT NOT NULL,
    PRIMARY KEY(c1),
    PRIMARY KEY(c2)
);
ERROR 1068 (42000): Multiple primary key defined

CREATE TABLE t1(
    c1 INT NOT NULL AUTO_INCREMENT,
    c2 INT NOT NULL,
    PRIMARY KEY(c1)
);
```

It’s also possible that this error results from a mistaken attempt to define a multi-part primary key. This is an example of the correct definition for such a key.

```
CREATE TABLE t1(
    c1 INT NOT NULL AUTO_INCREMENT,
    c2 INT NOT NULL,
    PRIMARY KEY(c1, c2)
);
```

Error 1074: Column length too big for column; use BLOB or TEXT instead

Error Code	SQLSTATE	Error	Description
1074	42000	ER_TOO_BIG_FIELDLENGTH	Column length too big for column ‘%s’ (max = %lu); use BLOB or TEXT instead

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1075: Incorrect table definition; there can be only one auto column and it must be defined as

Error Code	SQLSTATE	Error	Description
1075	42000	ER_WRONG_AUTO_KEY	Incorrect table definition; there can be only one auto column and it must be defined as a key

Possible Causes and Solutions

There can only be one AUTO_INCREMENT column per table, and the column must be defined as a key. Not adhering to either of these restrictions will result in this error. For example:

```
CREATE OR REPLACE TABLE animals (
    id1 MEDIUMINT NOT NULL AUTO_INCREMENT,
    id2 TINYINT NOT NULL AUTO_INCREMENT,
    name CHAR(30) NOT NULL,
    PRIMARY KEY (id1),
    KEY (id2)
);
ERROR 1075 (42000): Incorrect table definition; there can be only one auto column and it must be defined
as a key

CREATE OR REPLACE TABLE animals (
    id1 MEDIUMINT NOT NULL AUTO_INCREMENT,
    name CHAR(30) NOT NULL
);
ERROR 1075 (42000): Incorrect table definition; there can be only one auto column and it must be defined
as a key

CREATE OR REPLACE TABLE animals (
    id MEDIUMINT NOT NULL AUTO_INCREMENT,
    name CHAR(30) NOT NULL,
    PRIMARY KEY (id)
);
Query OK, 0 rows affected (0.017 sec)
```

Error 1149: You have an error in your SQL syntax

Error Code	SQLSTATE	Error	Description
1149	42000	ER_SYNTAX_ERROR	You have an error in your SQL syntax; check the manual that corresponds to your MariaDB server version for the right syntax to use

Possible Causes and Solutions

This is one of the most common errors to see. It's caused by an SQL syntax error. The error message will give you a clue as to where the error could be, as MariaDB displays the text following where it picked up an error. There are a huge number of possible causes (and in most cases they're simple typos), but here are a few common ones;

Delimiters

Delimiters need to be present at the end of each statement. See Delimiters.
For example:

```
SELECT 1
SELECT 2;
ERROR 1064 (42000): You have an error in your SQL syntax; check the manual that corresponds
  to your MariaDB server version for the right syntax to use near 'SELECT 2' at line 2
```

Here, there was no delimiter separating the first and the second line. MariaDB picked up the error at the start of the second line, pointing one to the end of the first line. The correct syntax is:

```
SELECT 1;
SELECT 2;
```

Delimiters in Stored Programs

When creating stored programs from the command-line, it is likely you will need to differentiate between the regular delimiter and a delimiter inside a BEGIN END block. See Delimiters.

For example, take the following, seemingly-valid declaration:

```
CREATE FUNCTION FortyTwo() RETURNS TINYINT DETERMINISTIC
BEGIN
  DECLARE x TINYINT;
  SET x = 42;
  RETURN x;
END;
```

Attempting to run will result in an error:

```
CREATE FUNCTION FortyTwo() RETURNS TINYINT DETERMINISTIC
    -> BEGIN
    ->   DECLARE x TINYINT;
ERROR 1064 (42000): You have an error in your SQL syntax; check the manual that corresponds
  to your MariaDB server version for the right syntax to use near '' at line 3
```

The error was picked up at the end of the `DECLARE x TINYINT;` line, guiding one to the delimiter found there. The solution is to specify a distinct delimiter for the duration of the process, using the DELIMITER command, for example:

```
DELIMITER //

CREATE FUNCTION FortyTwo() RETURNS TINYINT DETERMINISTIC
BEGIN
  DECLARE x TINYINT;
  SET x = 42;
  RETURN x;
END

//

DELIMITER ;
```

Reserved Words

Reserved words cannot be used as identifiers unless they are quoted. For example:

```
CREATE TABLE accessible(id INT);
ERROR 1064 (42000): You have an error in your SQL syntax; check the manual that corresponds
  to your MariaDB server version for the right syntax to use near 'accessible(id INT)' at line 1
```

The error was picked up after the `accessible` identifier, leading one to suspect that it's causing the problem. And indeed, it's a reserved word. There are a number of possible solutions.

Use a new, non-reserved, identifier:

```
CREATE TABLE accessible_status(id INT);
```

or quote the identifier:

```
CREATE TABLE `accessible`(id INT);
```

or fully qualify the identifier:

```
CREATE TABLE test.accessible(id INT);
```

Syntax Doesn't Match SQL_MODE

Some syntax may be valid in a particular SQL_MODE, but not in others. There are too many to list here, but the SQL_MODE page provides a full list.
For example:

```
CREATE TABLE "t" (id INT);
ERROR 1064 (42000): You have an error in your SQL syntax; check the manual that corresponds
  to your MariaDB server version for the right syntax to use near '"t" (id INT)' at line 1
```

The error message directs one to the identifier `t`. Double quotes cannot be used to quote identifiers unless ANSI_MODE is set, which in this case it isn't:

```
select @@sql_mode;
+--------------------------------------------------------------------------------------------+
| @@sql_mode                                                                                 |
+--------------------------------------------------------------------------------------------+
| STRICT_TRANS_TABLES,ERROR_FOR_DIVISION_BY_ZERO,NO_AUTO_CREATE_USER,NO_ENGINE_SUBSTITUTION |
+--------------------------------------------------------------------------------------------+
```

Either quote with the standard quote character, the backtick, or set the appropriate SQL_MODE:

```
SET @@SQL_MODE = CONCAT(@@SQL_MODE, ',ANSI_QUOTES');
CREATE TABLE "t" (id INT);
```

Oracle Mode

Oracle mode in particular has a large number of differences to the default SQL_MODE, for example:

```
CREATE TABLE t (id VARCHAR2(10));
ERROR 1064 (42000): You have an error in your SQL syntax; check the manual that corresponds
  to your MariaDB server version for the right syntax to use near '(10))' at line 1
```

The error is identified just after the VARCHAR2 type is specified, and this type is not valid in the default mode:

```
SELECT @@sql_mode;
+-------------------------------------------------------------------+
| @@sql_mode                                                        |
+-------------------------------------------------------------------+
| STRICT_TRANS_TABLES,ERROR_FOR_DIVISION_BY_ZERO,NO_AUTO_CREATE_USER |
+-------------------------------------------------------------------+
SET SQL_MODE='ORACLE';
CREATE TABLE t (id VARCHAR2(10));
```

See Oracle mode for a full list of syntax differences.

Error 1157: Couldn't uncompress communication packet

Error Code	SQLSTATE	Error	Description
1157	08S01	ER_NET_UNCOMPRESS_ERROR	Couldn't uncompress communication packet

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1158: Got an error reading communication packets

Error Code	SQLSTATE	Error	Description
1158	08S01	ER_NET_READ_ERROR	Got an error reading communication packets

Possible Causes

This error tells us that the connection between the server and client was aborted.
The most common cause is that the client hard-aborted the connection, without calling mysql_close().
It could also be a problem with the connection to the server, such as a wrong or lost package.

How to Find Out More

The error log may have more information about the cause of the error.
Setting the MariaDB server option log_warnings to a value of 4 or above can generate more diagnostic warnings in the error log when there is a problem reading packages:

```
2024-04-19 17:02:11 20090 [Warning] mariadbd: Could not read packet: fd: 4575  state: 1  read_length: 4
errno: 104  vio_errno: 1158  length: -1
```

How to interpret the above:

- `20090` is the connection id that got the warning/error.
- `fd: 4575` 4575 is the file descriptor that had a problem.
- `state: 1` shows that the file is open. Anything else means the file is not active. Note that in some cases MariaDB will try to abort a read on a file descriptor by closing it.
- `read_length: 4` is how many characters the server tried to read from the file.
- `errno 104` is the system error code (more below).
- `vio_errno: 1158` is our internal error code from the vio library, which stands for ER_NET_READ_ERROR "Got an error reading communication packets".
- `length: -1` is how many characters was reported to be read from the read() system call. -1 indicates failure. If `length` <= `read_length` then something broke in the communication.

You can use the perror utility to get a description of system and storage engine errors:

```
shell> perror 104
OS error code 104: Connection reset by peer
```

This means the connection was aborted by the application/user.

How to Fix

- Ensure you have a stable internet connection.
- Ensure that your applications calls mysql_close() for all open connections before exiting.

Error 1160: Got an error writing communication packets

Error Code	SQLSTATE	Error	Description
1160	08S01	ER_NET_ERROR_ON_WRITE	Got an error writing communication packets

Possible Causes

This error tells us that the connection between the server and client was aborted.
The most common cause is that the client hard-aborted the connection, without calling mysql_close().
It could also be a problem with the connection to the server, such as a wrong or lost package.

How to Find Out More

The error log may have more information about the cause of the error.
Setting the MariaDB server option log_warnings to a value of 4 or above can generate more diagnostic warnings in the error log when there is a problem reading packages:

```
2024-02-17 12:32:45 5461 [ERROR] mariadbd: Could not write packet: fd: 406  state: 2  errno: 32
vio_errno: 1160  length: 34
```

How to interpret the above:

- `5461` is the connection id that got the warning/error.
- `fd: 406` 406 is the file descriptor that had a problem.
- `state: 2`
- `length: 34` is how many characters the server tried to wrote to the file.
- `errno 32` is the system error code (more below).
- `vio_errno: 1160` is our internal error code from the vio library, which stands for ER_NET_WRITE_ERROR “Got an error writing communication packets”.
- `length: -1` is how many characters was reported to be read from the read() system call. -1 indicates failure. If `length` <= `read_length` then something broke in the communication.

You can use the perror utility to get a description of system and storage engine errors:

```
shell> perror 104
OS error code 104: Connection reset by peer
```

This means the connection was aborted by the application/user.

How to Fix

- Ensure you have a stable internet connection.
- Ensure that your applications calls mysql_close() for all open connections before exiting.

Error 1178: The storage engine for the table doesn't support

Error Code	SQLSTATE	Error	Description
1178	42000	ER_CHECK_NOT_IMPLEMENTED	The storage engine for the table doesn't support %s

Possible Causes and Solutions

MariaDB storage engines differ in many ways, and not all operations are supported by each engine. Perhaps you don't need the intended operation for the engine, or perhaps you need a different storage engine. For example, sequences don't support analyze table, as it's an unnecessary operation on a sequence table, which only contains one row.

```
CREATE SEQUENCE s START WITH 100 INCREMENT BY 10;

ANALYZE TABLE s;
+--------+---------+----------+-----------------------------------------------------------+
| Table  | Op      | Msg_type | Msg_text                                                  |
+--------+---------+----------+-----------------------------------------------------------+
| test.s | analyze | note     | The storage engine for the table doesn't support analyze |
+--------+---------+----------+-----------------------------------------------------------+
```

Error 1194: Table is marked as crashed and should be repaired

Error Code	SQLSTATE	Error	Description
1194	HY000	ER_CRASHED_ON_USAGE	Table '%s' is marked as crashed and should be repaired

Possible Causes and Solutions

This error occurs, in particular to MyISAM, Aria, Archive or CSV tables, if the table is marked as crashed. This can occur for a number of reasons, for example:

- running out of disk space
- sudden shutdown while the table was in use

Fixing the problem can usually be done by running a REPAIR TABLE statement, or one of the similar scripts, aria_chk, myisamchk or mariadb-check.

MariaDB Error Codes 1200 to 1299

- Error 1200: The server is not configured as slave
- Error 1201: Could not initialize master info structure
- Error 1202: Could not create slave thread; check system resources
- Error 1203: User already has more than 'max_user_connections' active connections
- Error 1204: You may only use constant expressions with SET
- Error 1205: Lock wait timeout exceeded; try restarting transaction
- Error 1206: The total number of locks exceeds the lock table size
- Error 1207: Update locks cannot be acquired during a READ UNCOMMITTED transaction
- Error 1208: DROP DATABASE not allowed while thread is holding global read lock
- Error 1209: CREATE DATABASE not allowed while thread is holding global read lock
- Error 1210: Incorrect arguments to
- Error 1211: is not allowed to create new users
- Error 1212: Incorrect table definition; all MERGE tables must be in the same database
- Error 1213: Deadlock found when trying to get lock; try restarting transaction
- Error 1214: The used table type doesn't support FULLTEXT indexes
- Error 1215: Cannot add foreign key constraint
- Error 1216: Cannot add or update a child row: a foreign key constraint fails

- Error 1217: Cannot delete or update a parent row: a foreign key constraint fails
- Error 1218: Error connecting to master
- Error 1219: Error running query on master
- Error 1220: Error when executing command
- Error 1221: Incorrect usage of
- Error 1222: The used SELECT statements have a different number of columns
- Error 1223: Can’t execute the query because you have a conflicting read lock
- Error 1224: Mixing of transactional and non-transactional tables is disabled
- Error 1225: Option used twice in statement
- Error 1226: User has exceeded the resource
- Error 1227: Access denied; you need (at least one of) the privilege(s) for this operation
- Error 1228: Variable is a SESSION variable and can’t be used with SET GLOBAL
- Error 1229: Variable is a GLOBAL variable and should be set with SET GLOBAL
- Error 1230: Variable doesn’t have a default value
- Error 1231: Variable can’t be set to the value of
- Error 1232: Incorrect argument type to variable
- Error 1233: Variable can only be set, not read
- Error 1234: Incorrect usage/placement
- Error 1235: This version of MariaDB doesn’t yet support
- Error 1236: Got fatal error from master when reading data from binary log
- Error 1237: Slave SQL thread ignored the query because of replicate-*-table rules
- Error 1238: Variable is a
- Error 1239: Incorrect foreign key definition
- Error 1240: Key reference and table reference don’t match
- Error 1241: Operand should contain column(s)
- Error 1242: Subquery returns more than 1 row
- Error 1243: Unknown prepared statement handler given
- Error 1244: Help database is corrupt or does not exist
- Error 1245: Cyclic reference on subqueries
- Error 1246: Converting column from to
- Error 1247: Reference not supported
- Error 1248: Every derived table must have its own alias
- Error 1249: Select was reduced during optimization
- Error 1250: Table from one of the SELECTs cannot be used
- Error 1251: Client does not support authentication protocol requested by server
- Error 1252: All parts of a SPATIAL index must be NOT NULL
- Error 1253: COLLATION is not valid for CHARACTER SET
- Error 1254: Slave is already running
- Error 1255: Slave already has been stopped
- Error 1256: Uncompressed data size too large
- Error 1257: ZLIB: Not enough memory
- Error 1258: ZLIB: Not enough room in the output buffer
- Error 1259: ZLIB: Input data corrupted
- Error 1260: Row was cut by GROUP_CONCAT()
- Error 1261: Row doesn’t contain data for all columns

- Error 1262: Row was truncated; it contained more data than there were input columns
- Error 1263: Column set to default value; NULL supplied to NOT NULL columnError 1263: Column set to d
- Error 1264: Out of range value for column
- Error 1265: Data truncated for column
- Error 1266: Using storage engine for table
- Error 1267: Illegal mix of collations for operation
- Error 1268: Cannot drop one or more of the requested users
- Error 1269: Can't revoke all privileges for one or more of the requested users
- Error 1270: Illegal mix of collations for operation
- Error 1271: Illegal mix of collations for operation
- Error 1272: Variable is not a variable component (can't be used as XXXX.variable_name)
- Error 1273: Unknown collation
- Error 1274: SSL parameters in CHANGE MASTER are ignored because this MariaDB slave was compiled with
- Error 1275: Server is running in –secure-auth mode, but has a password in the old format
- Error 1276: Field or reference of SELECT was resolved in SELECT
- Error 1277: Incorrect parameter or combination of parameters for START SLAVE UNTIL
- Error 1278: It is recommended to use –skip-slave-start when doing step-by-step replication with STA
- Error 1279: SQL thread is not to be started so UNTIL options are ignored
- Error 1280: Incorrect index name
- Error 1281: Incorrect catalog name
- Error 1282: Query cache failed to set size; new query cache size is
- Error 1283: Column cannot be part of FULLTEXT index
- Error 1284: Unknown key cache
- Error 1285: MariaDB is started in –skip-name-resolve mode
- Error 1286: Unknown storage engine
- Error 1287: is deprecated and will be removed in a future release. Please use instead
- Error 1288: The target table of the is not updatable
- Error 1289: The feature is disabled; you need MariaDB built with to have it working
- Error 1290: The MariaDB server is running with the option so it cannot execute this statement
- Error 1291: Column has duplicated value
- Error 1292: Truncated incorrect value
- Error 1293: Incorrect table definition; there can be only one TIMESTAMP column with CURRENT_TIMESTAM
- Error 1294: Invalid ON UPDATE clause
- Error 1295: This command is not supported in the prepared statement protocol yet
- Error 1296: Got error from
- Error 1297: Got temporary error from
- Error 1298: Unknown or incorrect time zone
- Error 1299: Invalid TIMESTAMP value in column at row

Error 1271: Illegal mix of collations for operation

Error Code	SQLSTATE	Error	Description
1271	HY000	ER_CANT_AGGREGATE_NCOLLATIONS	Illegal mix of collations for operation '%s'

Possible Causes and Solutions

This error occurs when attempting to combine (e.g., using UNION) two tables where the same column has different collation types. To resolve this, one of the column's collations must be adjusted to match the other.

Diagnosing Collation Types

To identify the collation type of a column, you can use the following query:

```
SELECT COLUMN_NAME, COLLATION_NAME
FROM INFORMATION_SCHEMA.COLUMNS
WHERE TABLE_SCHEMA = 'your_database_name'
AND TABLE_NAME = 'your_table_name';
```

For a comprehensive comparison, you might want to join `table1` and `table2` based on the `COLUMN_NAME` to visually inspect the collation differences.

Resolving Collation Conflicts

Assuming one column is using `utf8mb3_general_ci` and the other `utf8mb3_unicode_ci`, you can standardize the collation for a particular operation as follows:

```
FROM table;
SELECT COLUMN COLLATE utf8mb3_unicode_ci
```

This command temporarily adjusts the collation for `column` during the SELECT operation to `utf8mb3_unicode_ci`, ensuring consistent collation for the operation.

Error 1303: Can't create from within another stored routine

Error Code	SQLSTATE	Error	Description
1303	2F003	ER_SP_NO_RECURSIVE_CREATE	Can't create a %s from within another stored routine

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1304: already exists

Error Code	SQLSTATE	Error	Description
1304	42000	ER_SP_ALREADY_EXISTS	%s %s already exists

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1305: does not exist

Error Code	SQLSTATE	Error	Description
1305	42000	ER_SP_DOES_NOT_EXIST	%s %s does not exist

Possible Causes and Solutions

This error is returned when what is being called does not exist. For example:

```
CALL Reset_animal_count();
ERROR 1305 (42000): PROCEDURE test.Reset_animal_count does not exist

SELECT Reset_animal_count();
ERROR 1305 (42000): FUNCTION test.Reset_animal_count does not exist
```

There are a number of possible causes:

- The stored procedure or stored function has not yet been created. See CREATE PROCEDURE or CREATE FUNCTION. For example:

```
DELIMITER //
CREATE PROCEDURE Reset_animal_count()
    MODIFIES SQL DATA
    UPDATE animal_count SET animals = 0;
 //
Query OK, 0 rows affected (0.032 sec)

DELIMITER ;

CALL Reset_animal_count();
Query OK, 0 rows affected (0.001 sec)
```

- There was a typo in the name. Check also that the case is correct. See Identifier Case-sensitivity. For example:

```
CALL reset_animal_count();
ERROR 1305 (42000): PROCEDURE test.Reset_animal_count does not exist

CALL Reset_animal_count();
Query OK, 0 rows affected (0.001 sec)
```

- The database specified is not the same as the database containing the stored procedure or function. For example:

```
use test2
CALL Reset_animal_count();
ERROR 1305 (42000): PROCEDURE test2.Reset_animal_count does not exist
```

Either change the default (current) database with the USE statement, or specify the database in the call, for example:

```
CALL test.Reset_animal_count();
Query OK, 0 rows affected (0.001 sec)
```

or

```
use test
CALL Reset_animal_count();
Query OK, 0 rows affected (0.001 sec)
```

- One is trying to access a stored procedure instead of a stored function, or vice-versa. For example:

```
SELECT Reset_animal_count();
ERROR 1305 (42000): FUNCTION test.Reset_animal_count does not exist

CALL Reset_animal_count();
Query OK, 0 rows affected (0.001 sec)
```

This page is licensed: CC BY-SA / Gnu FDL

Error 1311: Referring to uninitialized variable

Error Code	SQLSTATE	Error	Description
1311	01000	ER_SP_UNINIT_VAR	Referring to uninitialized variable %s

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1312: PROCEDURE can't return a result set in the given context

Error Code	SQLSTATE	Error	Description
1312	0A000	ER_SP_BADSELECT	PROCEDURE %s can't return a result set in the given context

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1313: RETURN is only allowed in a FUNCTION

Error Code	SQLSTATE	Error	Description
1313	42000	ER_SP_BADRETURN	RETURN is only allowed in a FUNCTION

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1314: is not allowed in stored procedures

Error Code	SQLSTATE	Error	Description
1314	0A000	ER_SP_BADSTATEMENT	%s is not allowed in stored procedures

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1315: The update log is deprecated and replaced by the binary log

Error Code	SQLSTATE	Error	Description
1315	42000	ER_UPDATE_LOG_DEPRECATED_IGNORED	The update log is deprecated and replaced by the binary log; SET SQL_LOG_UPDATE has been ignored. This option will be removed in MariaDB 5.6.

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1316: The update log is deprecated and replaced by the binary log; SET SQL_LOG_UPDATE has been

Error Code	SQLSTATE	Error	Description
1316	42000	ER_UPDATE_LOG_DEPRECATED_TRANSLATED	The update log is deprecated and replaced by the binary log; SET SQL_LOG_UPDATE has been translated to SET SQL_LOG_BIN. This option will be removed in MariaDB 5.6.

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1317: Query execution was interrupted

Error Code	SQLSTATE	Error	Description
1317	70100	ER_QUERY_INTERRUPTED	Query execution was interrupted

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1318: Incorrect number of arguments; expected, got

Error Code	SQLSTATE	Error	Description
1318	42000	ER_SP_WRONG_NO_OF_ARGS	Incorrect number of arguments for %s %s; expected %u, got %u

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1319: Undefined CONDITION

Error Code	SQLSTATE	Error	Description
1319	42000	ER_SP_COND_MISMATCH	Undefined CONDITION: %s

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1320: No RETURN found in FUNCTION

Error Code	SQLSTATE	Error	Description
1320	42000	ER_SP_NORETURN	No RETURN found in FUNCTION %s

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1321: FUNCTION ended without RETURN

Error Code	SQLSTATE	Error	Description
1321	2F005	ER_SP_NORETURNEND	FUNCTION %s ended without RETURN

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1322: Cursor statement must be a SELECT

Error Code	SQLSTATE	Error	Description
1322	42000	ER_SP_BAD_CURSOR_QUERY	Cursor statement must be a SELECT

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1323: Cursor SELECT must not have INTO

Error Code	SQLSTATE	Error	Description
1323	42000	ER_SP_BAD_CURSOR_SELECT	Cursor SELECT must not have INTO

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1324: Undefined CURSOR

Error Code	SQLSTATE	Error	Description
1324	42000	ER_SP_CURSOR_MISMATCH	Undefined CURSOR: %s

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1325: Cursor is already open

Error Code	SQLSTATE	Error	Description
1325	24000	ER_SP_CURSOR_ALREADY_OPEN	Cursor is already open

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1326: Cursor is not open

Error Code	SQLSTATE	Error	Description
1326	24000	ER_SP_CURSOR_NOT_OPEN	Cursor is not open

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1327: Undeclared variable

Error Code	SQLSTATE	Error	Description
1327	42000	ER_SP_UNDECLARED_VAR	Undeclared variable: %s

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1328: Incorrect number of FETCH variables

Error Code	SQLSTATE	Error	Description
1328	HY000	ER_SP_WRONG_NO_OF_FETCH_ARGS	Incorrect number of FETCH variables

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1329: No data - zero rows fetched, selected, or processed

Error Code	SQLSTATE	Error	Description
1329	02000	ER_SP_FETCH_NO_DATA	No data - zero rows fetched, selected, or processed

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1330: Duplicate parameter

Error Code	SQLSTATE	Error	Description
1330	42000	ER_SP_DUP_PARAM	Duplicate parameter: %s

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1331: Duplicate variable

Error Code	SQLSTATE	Error	Description
1331	42000	ER_SP_DUP_VAR	Duplicate variable: %s

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1332: Duplicate condition

Error Code	SQLSTATE	Error	Description
1332	42000	ER_SP_DUP_COND	Duplicate condition: %s

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1333: Duplicate cursor

Error Code	SQLSTATE	Error	Description
1333	42000	ER_SP_DUP_CURS	Duplicate cursor: %s

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1334: Failed to ALTER

Error Code	SQLSTATE	Error	Description
1334	HY000	ER_SP_CANT_ALTER	Failed to ALTER %s %s

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1335: Subquery value not supported

Error Code	SQLSTATE	Error	Description
1335	0A000	ER_SP_SUBSELECT_NYI	Subquery value not supported

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1336: is not allowed in stored function or trigger

Error Code	SQLSTATE	Error	Description
1336	0A000	ER_STMT_NOT_ALLOWED_IN_SF_OR_TRG	%s is not allowed in stored function or trigger

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1337: Variable or condition declaration after cursor or handler declaration

Error Code	SQLSTATE	Error	Description
1337	42000	ER_SP_VARCOND_AFTER_CURSHNDLR	Variable or condition declaration after cursor or handler declaration

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1338: Cursor declaration after handler declaration

Error Code	SQLSTATE	Error	Description
1338	42000	ER_SP_CURSOR_AFTER_HANDLER	Cursor declaration after handler declaration

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1339: Case not found for CASE statement

Error Code	SQLSTATE	Error	Description
1339	20000	ER_SP_CASE_NOT_FOUND	Case not found for CASE statement

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1340: Configuration file is too big

Error Code	SQLSTATE	Error	Description
1340	HY000	ER_FPARSER_TOO_BIG_FILE	Configuration file ‘%s’ is too big

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1341: Malformed file type header in file

Error Code	SQLSTATE	Error	Description
1341	HY000	ER_FPARSER_BAD_HEADER	Malformed file type header in file ‘%s’

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1342: Unexpected end of file while parsing comment

Error Code	SQLSTATE	Error	Description
1342	HY000	ER_FPARSER_EOF_IN_COMMENT	Unexpected end of file while parsing comment ‘%s’

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1343: Error while parsing parameter

Error Code	SQLSTATE	Error	Description
1343	HY000	ER_FPARSER_ERROR_IN_PARAMETER	Error while parsing parameter ‘%s’ (line: ‘%s’)

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1344: Unexpected end of file while skipping unknown parameter

Error Code	SQLSTATE	Error	Description
1344	HY000	ER_FPARSER_EOF_IN_UNKNOWN_PARAMETER	Unexpected end of file while skipping unknown parameter ‘%s’

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1345: EXPLAIN/SHOW can not be issued; lacking privileges for underlying table

Error Code	SQLSTATE	Error	Description
1345	HY000	ER_VIEW_NO_EXPLAIN	EXPLAIN/SHOW can not be issued; lacking privileges for underlying table

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1346: File has unknown type in its header

Error Code	SQLSTATE	Error	Description
1346	HY000	ER_FRM_UNKNOWN_TYPE	File ‘%s’ has unknown type ‘%s’ in its header

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1347: '%s.%s' is not %s

Error Code	SQLSTATE	Error	Description
1347	HY000	ER_WRONG_OBJECT	'%s.%s' is not %s

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1348: Column is not updatable

Error Code	SQLSTATE	Error	Description
1348	HY000	ER_NONUPDATEABLE_COLUMN	Column '%s' is not updatable

Possible Causes and Solutions

The usual cause is that an UPDATE, LOAD DATA or LOAD XML, is being performed on the column of a view where the view column is an expression.

This page is licensed: CC BY-SA / Gnu FDL

Error 1349: View's SELECT contains a subquery in the FROM clause

Error Code	SQLSTATE	Error	Description
1349	HY000	ER_VIEW_SELECT_DERIVED	View's SELECT contains a subquery in the FROM clause

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1350: View's SELECT contains clause

Error Code	SQLSTATE	Error	Description
1350	HY000	ER_VIEW_SELECT_CLAUSE	View's SELECT contains a '%s' clause

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1351: View's SELECT contains a variable or parameter

Error Code	SQLSTATE	Error	Description
1351	HY000	ER_VIEW_SELECT_VARIABLE	View's SELECT contains a variable or parameter

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1352: View's SELECT refers to a temporary table'

Error Code	SQLSTATE	Error	Description
1352	HY000	ER_VIEW_SELECT_TMPTABLE	View's SELECT refers to a temporary table '%s'

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1353: View's SELECT and view's field list have different column counts

Error Code	SQLSTATE	Error	Description
1353	HY000	ER_VIEW_WRONG_LIST	View's SELECT and view's field list have different column counts

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1354: View merge algorithm can't be used here for now

Error Code	SQLSTATE	Error	Description
1354	HY000	ER_WARN_VIEW_MERGE	View merge algorithm can't be used here for now (assumed undefined algorithm)

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1355: View being updated does not have complete key of underlying table in it

Error Code	SQLSTATE	Error	Description
1355	HY000	ER_WARN_VIEW_WITHOUT_KEY	View being updated does not have complete key of underlying table in it

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1356: View references invalid table(s) or column(s) or function(s) or definer/invoker of view

Error Code	SQLSTATE	Error	Description
1356	HY000	ER_VIEW_INVALID	View '%s.%s' references invalid table(s) or column(s) or function(s) or definer/invoker of view lack rights to use them

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1357: Can't drop or alter from within another stored routine

Error Code	SQLSTATE	Error	Description
1357	HY000	ER_SP_NO_DROP_SP	Can't drop or alter a %s from within another stored routine

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1358: GOTO is not allowed in a stored procedure handler

Error Code	SQLSTATE	Error	Description
1358	HY000	ER_SP_GOTO_IN_HNDLR	GOTO is not allowed in a stored procedure handler

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1359: Trigger already exists

Error Code	SQLSTATE	Error	Description
1359	HY000	ER_TRG_ALREADY_EXISTS	Trigger already exists

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1360: Trigger does not exist

Error Code	SQLSTATE	Error	Description
1360	HY000	ER_TRG_DOES_NOT_EXIST	Trigger does not exist

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1361: Trigger's is view or temporary table

Error Code	SQLSTATE	Error	Description
1361	HY000	ER_TRG_ON_VIEW_OR_TEMP_TABLE	Trigger's '%s' is view or temporary table

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1362: Updating of row is not allowed in trigger

Error Code	SQLSTATE	Error	Description
1362	HY000	ER_TRG_CANT_CHANGE_ROW	Updating of %s row is not allowed in %strigger

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1363: There is no row in trigger

Error Code	SQLSTATE	Error	Description
1363	HY000	ER_TRG_NO_SUCH_ROW_IN_TRG	There is no %s row in %s trigger

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1364: Field doesn't have a default value

Error Code	SQLSTATE	Error	Description
1364	HY000	ER_NO_DEFAULT_FOR_FIELD	Field '%s' doesn't have a default value

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1365: Division by 0

Error Code	SQLSTATE	Error	Description
1365	22012	ER_DIVISION_BY_ZER	Division by 0

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1366: Incorrect value for column at row

Error Code	SQLSTATE	Error	Description
1366	HY000	ER_TRUNCATED_WRONG_VALUE_FOR_FIELD	Incorrect %s value: '%s' for column '%s' at row %ld

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1367: Illegal value found during parsing

Error Code	SQLSTATE	Error	Description
1367	22007	ER_ILLEGAL_VALUE_FOR_TYPE	Illegal %s '%s' value found during parsing

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1368: CHECK OPTION on non-updatable view

Error Code	SQLSTATE	Error	Description
1368	HY000	ER_VIEW_NONUPD_CHECK	CHECK OPTION on non-updatable view '%s.%s'

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1369: CHECK OPTION failed

Error Code	SQLSTATE	Error	Description
1369	HY000	ER_VIEW_CHECK_FAILED	CHECK OPTION failed '%s.%s'

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1370: command denied to user for routine

Error Code	SQLSTATE	Error	Description
1370	42000	ER_PROCACCESS_DENIED_ERROR	%s command denied to user ‘%s’@‘%s’ for routine ‘%s’

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1371: Failed purging old relay logs

Error Code	SQLSTATE	Error	Description
1371	HY000	ER_RELAY_LOG_FAIL	Failed purging old relay logs: %s

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1372: Password hash should be a %d-digit hexadecimal number

Error Code	SQLSTATE	Error	Description
1372	HY000	ER_PASSWD_LENGTH	Password hash should be a %d-digit hexadecimal number

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1373: Target log not found in binlog index

Error Code	SQLSTATE	Error	Description
1373	HY000	ER_UNKNOWN_TARGET_BINLOG	Target log not found in binlog index

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1374: I/O error reading log index file

Error Code	SQLSTATE	Error	Description
1374	HY000	ER_IO_ERR_LOG_INDEX_READ	I/O error reading log index file

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1375: Server configuration does not permit binlog purge

Error Code	SQLSTATE	Error	Description
1375	HY000	ER_BINLOG_PURGE_PROHIBITED	Server configuration does not permit binlog purge

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1376: Failed on fseek()

Error Code	SQLSTATE	Error	Description
1376	HY000	ER_FSEEK_FAIL	Failed on fseek()

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1377: Fatal error during log purge

Error Code	SQLSTATE	Error	Description
1377	HY000	ER_BINLOG_PURGE_FATAL_ERR	Fatal error during log purge

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1378: A purgeable log is in use, will not purge

Error Code	SQLSTATE	Error	Description
1378	HY000	ER_LOG_IN_USE	A purgeable log is in use, will not purge

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1379: Unknown error during log purge

Error Code	SQLSTATE	Error	Description
1379	HY000	ER_LOG_PURGE_UNKNOWN_ERR	Unknown error during log purge

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1380: Failed initializing relay log position

Error Code	SQLSTATE	Error	Description
1380	HY000	ER_RELAY_LOG_INIT	Failed initializing relay log position: %s

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1381: You are not using binary logging

Error Code	SQLSTATE	Error	Description
1381	HY000	ER_NO_BINARY_LOGGING	You are not using binary logging

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1382: The syntax is reserved for purposes internal to the MariaDB server

Error Code	SQLSTATE	Error	Description
1382	HY000	ER_RESERVED_SYNTAX	The '%s' syntax is reserved for purposes internal to the MariaDB server

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1383: WSAStartup Failed

Error Code	SQLSTATE	Error	Description
1383	HY000	ER_WSAS_FAILED	WSAStartup Failed

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1384: Can't handle procedures with different groups yet

Error Code	SQLSTATE	Error	Description
1384	HY000	ER_DIFF_GROUPS_PROC	Can't handle procedures with different groups yet

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1385: Select must have a group with this procedure

Error Code	SQLSTATE	Error	Description
1385	HY000	ER_NO_GROUP_FOR_PROC	Select must have a group with this procedure

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 1386: Can't use ORDER clause with this procedure

MariaDB Error Codes 1500 to 1599

- Error 1500: It is only possible to mix RANGE/LIST partitioning with HASH/KEY partitioning for subpar
- Error 1501: Failed to create specific handler file
- Error 1502: A BLOB field is not allowed in partition function
- Error 1503: must include all columns in the table's partitioning function
- Error 1504: Number of = 0 is not an allowed value
- Error 1505: Partition management on a not partitioned table is not possible
- Error 1506: Foreign key clause is not yet supported in conjunction with partitioning
- Error 1507: Error in list of partitions to
- Error 1508: Cannot remove all partitions, use DROP TABLE instead
- Error 1509: COALESCE PARTITION can only be used on HASH/KEY partitions
- Error 1510: REORGANIZE PARTITION can only be used to reorganize partitions not to change their numbe
- Error 1511: REORGANIZE PARTITION without parameters can only be used on auto-partitioned tables
- Error 1512: PARTITION can only be used on RANGE/LIST partitions
- Error 1513: Trying to Add partition(s) with wrong number of subpartitions
- Error 1514: At least one partition must be added
- Error 1515: At least one partition must be coalesced
- Error 1516: More partitions to reorganize than there are partitions
- Error 1517: Duplicate partition name
- Error 1518: It is not allowed to shut off binlog on this command
- Error 1519: When reorganizing a set of partitions they must be in consecutive order
- Error 1520: Reorganize of range partitions cannot change total ranges except for last partition
- Error 1521: Partition function not supported in this version for this handler
- Error 1522: Partition state cannot be defined from CREATE/ALTER TABLE
- Error 1523: The handler only supports 32 bit integers in VALUES
- Error 1524: Plugin is not loaded
- Error 1525: Incorrect value
- Error 1526: Table has no partition for value
- Error 1527: It is not allowed to specify more than once
- Error 1528: Failed to create

- Error 1529: Failed to drop
- Error 1530: The handler doesn't support autoextend of tablespaces
- Error 1531: A size parameter was incorrectly specified, either number or on the form 10M
- Error 1532: The size number was correct but we don't allow the digit part to be more than 2 billion
- Error 1533: Failed to alter
- Error 1534: Writing one row to the row-based binary log failed
- Error 1535: Table definition on master and slave does not match
- Error 1536: Slave running with –log-slave-updates must use row-based binary logging to be able to r
- Error 1537: Event already exists
- Error 1538: Failed to store event. Error code from storage engine.
- Error 1539: Unknown event
- Error 1540: Failed to alter event
- Error 1541: Failed to drop
- Error 1542: INTERVAL is either not positive or too big
- Error 1543: ENDS is either invalid or before STARTS
- Error 1544: Event execution time is in the past. Event has been disabled
- Error 1545: Failed to open mysql.event
- Error 1546: No datetime expression provided
- Error 1547: Column count is wrong. Expected found. The table is probably corrupted
- Error 1548: Cannot load from mysql. The table is probably corrupted
- Error 1549: Failed to delete the event from mysql.event
- Error 1550: Error during compilation of event's body
- Error 1551: Same old and new event name
- Error 1552: Data for column too long
- Error 1553: Cannot drop index needed in a foreign key constraint
- Error 1554: The syntax is deprecated and will be removed in MariaDB
- Error 1555: You can't write-lock a log table. Only read access is possible
- Error 1556: You can't use locks with log tables
- Error 1557: Upholding foreign key constraints for table, entry, key would lead to a duplicate entry
- Error 1558: Column count is wrong. Expected found. Created with MariaDB now running. Please use mysq
- Error 1559: Cannot switch out of the row-based binary log format when the session has open temporary
- Error 1560: Cannot change the binary logging format inside a stored function or trigger
- Error 1561: You should never see it
- Error 1562: Cannot create temporary table with partitions
- Error 1563: Partition constant is out of partition function domain
- Error 1564: This partition function is not allowed
- Error 1565: Error in DDL log
- Error 1566: Not allowed to use NULL value in VALUES LESS THAN
- Error 1567: Incorrect partition name
- Error 1568: Transaction isolation level can't be changed while a transaction is in progress
- Error 1569: ALTER TABLE causes auto_increment resequencing, resulting in duplicate entry for key
- Error 1570: Internal scheduler error
- Error 1571: Error during starting/stopping of the scheduler
- Error 1572: Engine cannot be used in partitioned tables
- Error 1573: Cannot activate log

- Error 1574: The server was not built with row-based replication
- Error 1575: Decoding of base64 string failed
- Error 1576: Recursion of EVENT DDL statements is forbidden when body is present
- Error 1577: Cannot proceed because system tables used by Event Scheduler were found damaged at serve
- Error 1578: Only integers allowed as number here
- Error 1579: This storage engine cannot be used for log tables
- Error 1580: You cannot '%s' a log table if logging is enabled
- Error 1581: Cannot rename. When logging enabled, rename to/from log table must rename two tables
- Error 1582: Incorrect parameter count in the call to native function
- Error 1583: Incorrect parameters in the call to native function
- Error 1584: Incorrect parameters in the call to stored function
- Error 1585: This function has the same name as a native function
- Error 1586: Duplicate entry for key
- Error 1587: Too many files opened, please execute the command again
- Error 1588: Event execution time is in the past and ON COMPLETION NOT PRESERVE is set
- Error 1589: Event execution time is in the past and ON COMPLETION NOT PRESERVE is set
- Error 1590: The incident occurred on the master
- Error 1591: Table has no partition for some existing values
- Error 1592: Unsafe statement written to the binary log using statement format since BINLOG_FORMAT =
- Error 1593: Fatal error
- Error 1594: Relay log read failure
- Error 1595: Relay log write failure
- Error 1596: Failed to create
- Error 1597: Master command failed
- Error 1598: Binary logging not possible
- Error 1599: View has no creation context

Error 1557: Upholding foreign key constraints for table, entry, key would lead to a duplicate entry

Error 1557: You should never see it

Error Code	SQLSTATE	Error	Description
1557	HY000	ER_UNUSED_4	You should never see it

Possible Causes and Solutions

Error 1558: Column count is wrong. Expected found. Created with MariaDB now running. Please use mysq

Error Code	SQLSTATE	Error	Description
1558	HY000	ER_COL_COUNT_DOESNT_MATCH_PLEASE_UPDATE	Column count of mysql.%s is wrong. Expected %d, found %d. Created with MariaDB %d, now running %d. Please use mysql_upgrade to fix this error.

Possible Causes and Solutions

Not upgrading properly

This error likely means an upgrade hasn't been performed properly, as one of the system tables does not match the expected size for the running release. mariadb-upgrade usually takes care of this. See Upgrading Between Major MariaDB Versions.

Error 1832: Cannot change column: used in a foreign key constraint

Error Code	SQLSTATE	Error	Description
1832	HY000	ER_FK_COLUMN_CANNOT_CHANGE	Cannot change column ‘%s’: used in a foreign key constraint ‘%s’

Possible Causes and Solutions

An `ALTER TABLE` statement tried to change a column that the table uses as a foreign key, in a way that would change how its values compare with the referenced column. Changing the column’s type, length, character set, or

collation all qualify. A common case is converting a table to a different collation, where the referenced table still uses the old one.

Setting `foreign_key_checks` to `0` does not lift this restriction, and neither does choosing a different `ALGORITHM`.

To make the change, drop the constraint in the same `ALTER TABLE` statement as the column change, apply the matching change to the referenced table, then re-create the constraint. For the full procedure, see Changing the Character Set or Collation of a Foreign Key Column.

If the referenced table is the one being altered, the server reports error 1833 instead.

This page is licensed: CC BY-SA / Gnu FDL

Error 1833: Cannot change column: used in a foreign key constraint of table

Error Code	SQLSTATE	Error	Description
1833	HY000	ER_FK_COLUMN_CANNOT_CHANGE_CHILD	Cannot change column '%s': used in a foreign key constraint '%s' of table '%s'

Possible Causes and Solutions

An `ALTER TABLE` statement tried to change a column that another table references through a foreign key, in a way that would change how its values compare with the referencing column. Changing the column's type, length, character set, or collation all qualify. A common case is converting a table to a different collation, where the referencing table still uses the old one. The third name in the message is the table holding the constraint.

Setting `foreign_key_checks` to `0` does not lift this restriction, and neither does choosing a different `ALGORITHM`.

A referencing table's constraint cannot be dropped from within the referenced table's `ALTER TABLE` statement, so drop it on the referencing table first, then apply the change to both tables and re-create the constraint. For the full procedure, see Changing the Character Set or Collation of a Foreign Key Column.

If the table being altered is the one holding the constraint, the server reports error 1832 instead.

Error 1837: When GTID_NEXT is set to a GTID, you must explicitly set it again after a COMMIT or ROLL

Error Code	SQLSTATE	Error	Description
1837	HY000	ER_GTID_NEXT_TYPE_UNDEFINED_GROUP	When GTID_NEXT is set to a GTID, you must explicitly set it again after a COMMIT or ROLLBACK. If you see this error message in the slave SQL thread, it means that a table in the current transaction is transactional on the master and non-transactional on the slave. In a client connection, it means that you executed SET GTID_NEXT before a transaction and forgot to set GTID_NEXT to a different identifier or to 'AUTOMATIC' after COMMIT or ROLLBACK. Current GTID_NEXT is '%s'

Error 3024: Query execution was interrupted, maximum statement execution time exceeded

Error 3024: You should never see it

Error Code	SQLSTATE	Error	Description
3024	HY000	ER_UNUSED_1	You should never see it

Possible Causes and Solutions

The cause is that the executing statement took more than max_statement_time (primary) or slave_max_statement_time (replica) to execute.

To fix this, you have to either increase the value of max_statement_time or find out why the query is slow. Start by doing an EXPLAIN or ANALYZE on the query to find out how the query is executed.

Error 3048: Out of range error

Error Code	SQLSTATE	Error	Description
3048		ER_STD_OUT_OF_RANGE_ERROR	Out of range error: %-.256s in function %s.

Possible Causes and Solutions

Function Arguments Outside the Expected Bounds

Functions arguments have an expected range, and this error is returned if this range is exceeded. Follow the documentation for the specific function indicated in the error message. For example, the ST_GeoHash function expects the longitude and latitude parameters to be between -180 and 180. In this case, the longitude argument is invalid:

```
SELECT ST_GeoHash(181,30,15);
ERROR 3048 (HY000): Out of range error: Longitude should be [-180,180] in function ST_GeoHash.
```

By providing a longitude argument within the expected range, the error is no longer returned:

```
SELECT ST_GeoHash(180,30,15);
+-----------------------+
| ST_GeoHash(180,30,15) |
+-----------------------+
| xvrfxvrfxvrfxvr       |
+-----------------------+
```

Error 4002: WITH column list and SELECT field list have different column counts

Error Code	SQLSTATE	Error	Description
4002		ER_WITH_COL_WRONG_LIST	WITH column list and SELECT field list have different column counts

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 4003: Too many WITH elements in WITH clause

Error Code	SQLSTATE	Error	Description
4003		ER_TOO_MANY_DEFINITIONS_IN_WITH_CLAUSE	Too many WITH elements in WITH clause

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 4004: Duplicate query name in WITH clause

Error Code	SQLSTATE	Error	Description
4004		ER_DUP_QUERY_NAME	Duplicate query name %`-.64s in WITH clause

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 4005: No anchors for recursive WITH element

Error Code	SQLSTATE	Error	Description
4005		ER_RECURSIVE_WITHOUT_ANCHORS	No anchors for recursive WITH element ‘%s’

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 4006: Unacceptable mutual recursion with anchored table

Error Code	SQLSTATE	Error	Description
4006		ER_UNACCEPTABLE_MUTUAL_RECURSION	Unacceptable mutual recursion with anchored table ‘%s’

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 4007: Reference to recursive WITH table in materialized derived

Error Code	SQLSTATE	Error	Description
4007		ER_REF_TO_RECURSIVE_WITH_TABLE_IN_DERIVED	Reference to recursive WITH table ‘%s’ in materialized derived

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 4008: Restrictions imposed on recursive definitions are violated for table

Error Code	SQLSTATE	Error	Description
4008		ER_NOT_STANDARD_COMPLIANT_RECURSIVE	Restrictions imposed on recursive definitions are violated for table ‘%s’“R_WRONG_WINDOW_SPEC_NAME

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 4009: Window specification with name is not defined

Error Code	SQLSTATE	Error	Description
4009		ER_WRONG_WINDOW_SPEC_NAME	Window specification with name ‘%s’ is not defined

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 4010: Multiple window specifications with the same name

Error Code	SQLSTATE	Error	Description
4010		ER_DUP_WINDOW_NAME	Multiple window specifications with the same name ‘%s’

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 4011: Window specification referencing another one cannot contain partition list

Error Code	SQLSTATE	Error	Description
4011		ER_PARTITION_LIST_IN_REFERENCING_WINDOW_SPEC	Window specification referencing another one ‘%s’ cannot contain partition list

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 4012: Referenced window specification already contains order list

Error Code	SQLSTATE	Error	Description
4012		ER_ORDER_LIST_IN_REFERENCING_WINDOW_SPEC	Referenced window specification ‘%s’ already contains order list

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 4013: Referenced window specification cannot contain window frame

Error Code	SQLSTATE	Error	Description
4013		ER_WINDOW_FRAME_IN_REFERENCED_WINDOW_SPEC	Referenced window specification ‘%s’ cannot contain window frame

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 4014: Unacceptable combination of window frame bound specifications

Error Code	SQLSTATE	Error	Description
4014		ER_BAD_COMBINATION_OF_WINDOW_FRAME_BOUND_SPECS	Unacceptable combination of window frame bound specifications

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 4015: Window function is allowed only in SELECT list and ORDER BY clause

Error Code	SQLSTATE	Error	Description
4015		ER_WRONG_PLACEMENT_OF_WINDOW_FUNCTION	Window function is allowed only in SELECT list and ORDER BY clause

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 4016: Window function is not allowed in window specification

Error Code	SQLSTATE	Error	Description
4016		ER_WINDOW_FUNCTION_IN_WINDOW_SPEC	Window function is not allowed in window specification

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 4017: Window frame is not allowed with

Error Code	SQLSTATE	Error	Description
4017		ER_NOT_ALLOWED_WINDOW_FRAME	Window frame is not allowed with ‘%s’

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 4018: No order list in window specification for

Error Code	SQLSTATE	Error	Description
4018		ER_NO_ORDER_LIST_IN_WINDOW_SPEC	No order list in window specification for ‘%s’

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 4084: Sequence has run out

Error Code	SQLSTATE	Error	Description
4084		ER_SEQUENCE_RUN_OUT	Sequence '%-.64s.%-.64s' has run out

Possible Causes and Solutions

Sequence has Completed Normally

In a sequence, once the MAXVALUE has been reached, and the CYCLE argument has not been used, further attempts to set the next value will fail:

```
CREATE OR REPLACE SEQUENCE s START WITH 1 INCREMENT BY 1 MAXVALUE=2;

SELECT NEXTVAL(s);
+------------+
| NEXTVAL(s) |
+------------+
|          1 |
+------------+

SELECT NEXTVAL(s);
+------------+
| NEXTVAL(s) |
+------------+
|          2 |
+------------+

SELECT NEXTVAL(s);
ERROR 4084 (HY000): Sequence 'test.s' has run out
```

This is usually intended behaviour, but there are a number of ways to prevent this:

Choose a larger MAXVALUE

Prior to MariaDB 11.5, this defaulted to the maximum, BIGINT. From MariaDB 11.5, it can be BIGINT UNSIGNED

```
CREATE OR REPLACE SEQUENCE s AS BIGINT UNSIGNED START WITH 1 INCREMENT BY 1;

SELECT SEQUENCE_NAME,MAXIMUM_VALUE FROM INFORMATION_SCHEMA.SEQUENCES\G
*************************** 1. row ***************************
SEQUENCE_NAME: s
MAXIMUM_VALUE: 18446744073709551614
```

Cycling

If reuse sequence values is not a problem, you can cycle back to the start once the maximum value has been reached:

```
CREATE OR REPLACE SEQUENCE s START WITH 1 INCREMENT BY 1 MAXVALUE=2 CYCLE;

SELECT NEXTVAL(s);
+------------+
| NEXTVAL(s) |
+------------+
|          1 |
+------------+

SELECT NEXTVAL(s);
+------------+
| NEXTVAL(s) |
+------------+
|          2 |
+------------+

SELECT NEXTVAL(s);
+------------+
| NEXTVAL(s) |
+------------+
|          1 |
+------------+
```

Sequence has Completed Due to Cache

The underlying table is only updated with a new sequence value the first time the value is created, and then each time the cache expires. By default the cache is set to `1000`. For example:

```
CREATE OR REPLACE SEQUENCE s START WITH 1 INCREMENT BY 1 MAXVALUE=10 CACHE=5;

SELECT NEXTVAL(s);
+------------+
| NEXTVAL(s) |
+------------+
|          1 |
+------------+

SELECT NEXTVAL(s);
+------------+
| NEXTVAL(s) |
+------------+
|          2 |
+------------+

FLUSH TABLES s;

SELECT NEXTVAL(s);
+------------+
| NEXTVAL(s) |
+------------+
|          6 |
+------------+

FLUSH TABLES s;

SELECT NEXTVAL(s);
ERROR 4084 (HY000): Sequence 'test.s' has run out
```

This behaviour can be prevented by setting the cache to zero, so that the value stored in the underlying table is written each time:

```
CREATE OR REPLACE SEQUENCE s START WITH 1 INCREMENT BY 1 MAXVALUE=10 CACHE=0;

SELECT NEXTVAL(s);
+------------+
| NEXTVAL(s) |
+------------+
|          1 |
+------------+

SELECT NEXTVAL(s);
+------------+
| NEXTVAL(s) |
+------------+
|          2 |
+------------+

FLUSH TABLES s;

SELECT NEXTVAL(s);
+------------+
| NEXTVAL(s) |
+------------+
|          3 |

MariaDB Error Codes 4100 to 4199

- Error 4100: Field reference can't be used in table value constructor
- Error 4101: Numeric datatype is required for function

- Error 4102: Argument to the function is not a constant for a partition
- Error 4104: function only accepts arguments that can be converted to numerical types
- Error 4105: Aggregate specific instruction (FETCH GROUP NEXT ROW) used in a wrong context
- Error 4106: Aggregate specific instruction(FETCH GROUP NEXT ROW) missing from the aggregate function
- Error 4107: Limit only accepts integer values
- Error 4108: Invisible column must have a default value
- Error 4109: Rows matched: Changed: Inserted: Warnings:
- Error 4110: must be of type for system-versioned table
- Error 4111: Transaction-precise system versioning for is not supported
- Error 4112: You should never see it
- Error 4113: Wrong partitioning type, expected type
- Error 4114: Versioned table last HISTORY partition is out of, need more HISTORY partitions
- Error 4115: Maybe missing parameters
- Error 4116: Can only drop oldest partitions when rotating by INTERVAL
- Error 4117: You should never see it
- Error 4118: Partition contains non-historical data
- Error 4119: Not allowed for system-versioned. Change @@system_versioning_alter_history to proceed wi
- Error 4120: Not allowed for system-versioned. Change to/from native system versioning engine is not
- Error 4121: SYSTEM_TIME range selector is not allowed
- Error 4122: Conflicting FOR SYSTEM_TIME clauses in WITH RECURSIVE
- Error 4123: Table must have at least one versioned column
- Error 4124: Table is not system-versioned
- Error 4125: Wrong parameters for: missing
- Error 4126: PERIOD FOR SYSTEM_TIME must use columns
- Error 4127: Wrong parameters for partitioned: wrong value for
- Error 4128: Wrong partitions for: must have at least one HISTORY and exactly one last CURRENT
- Error 4129: TRX_ID not found in mysql.transaction_registry
- Error 4130: Can not change system versioning field
- Error 4131: Can not DROP SYSTEM VERSIONING for table partitioned BY SYSTEM_TIME
- Error 4132: System-versioned tables in the database are not supported
- Error 4133: Transaction registry is disabled
- Error 4134: Duplicate ROW column
- Error 4135: Table is already system-versioned
- Error 4136: You should never see it
- Error 4137: System-versioned tables do not support
- Error 4138: Transaction-precise system-versioned tables do not support partitioning by ROW START or
- Error 4139: The index file for table is full
- Error 4140: The column cannot be changed more than once in a single UPDATE statement
- Error 4141: Row with no elements is not allowed in table value constructor in this context
- Error 4142: SYSTEM_TIME partitions in table does not support historical query
- Error 4143: index does not support this operation
- Error 4144: Changing table options requires the table to be rebuilt
- Error 4145: Can’t execute the command as you have a BACKUP STAGE active
- Error 4146: You must start backup with “BACKUP STAGE START”
- Error 4147: Backup stage is same or before current backup stage

- Error 4148: Backup stage failed
- Error 4149: Unknown backup stage: Stage should be one of START, FLUSH, BLOCK_DDL, BLOCK_COMMIT or EN
- Error 4150: User is blocked because of too many credential errors; unblock with ‘FLUSH PRIVILEGES’
- Error 4151: Access denied, this account is locked
- Error 4152: Application-time period table cannot be temporary
- Error 4153: Fields of PERIOD FOR have different types
- Error 4154: Cannot specify more than one application-time period
- Error 4155: Period field cannot be
- Error 4156: Period is not found in table
- Error 4157: Column used in period specified in update SET list
- Error 4158: Can’t DROP CONSTRAINT. Use DROP PERIOD for this
- Error 4159: Specified key part was too long; max key part length is
- Error 4160: Comment for database is too long
- Error 4161: Unknown data type
- Error 4162: Operator does not exists
- Error 4163: Table history row start is later than row end
- Error 4164: STARTS is later than query time, first history partition may exceed INTERVAL value
- Error 4165: DDL-statement is forbidden as table storage engine does not support Galera replication
- Error 4166: The used command is not allowed because the MariaDB server or client has disabled the lo
- Error 4167: No secure transports are configured, unable to set –require_secure_transport=ON
- Error 4168: Slave SQL thread ignored the ‘%s’ because table is shared
- Error 4169: AUTO_INCREMENT column cannot be used in the UNIQUE index
- Error 4170: Key cannot explicitly include column
- Error 4171: Key cannot have WITHOUT OVERLAPS
- Error 4172: is not allowed in this context
- Error 4173: Engine does not support rollback. Changes where committed during rollback call
- Error 4174: A primary key cannot be marked as IGNORE
- Error 4175: SKIP LOCKED makes this statement unsafe
- Error 4176: Field can’t be set for JSON_TABLE
- Error 4177: Every table function must have an alias
- Error 4178: Can’t store an array or an object in the scalar column of JSON_TABLE
- Error 4179: Can’t store multiple matches of the path in the column of JSON_TABLE
- Error 4180: FETCH … WITH TIES requires ORDER BY clause to be present
- Error 4181: Dropped orphan trigger, originally created for table
- Error 4182: Storage engine is disabled
- Error 4183: SFORMAT error
- Error 4184: Convert partition is not supported for subpartitioned table
- Error 4185: MariaDB tried to use the %s, but its provider plugin is not loaded
- Error 4186: Failed to parse histogram for table at offset
- Error 4187: OUT or INOUT argument for function is not allowed here
- Error 4188: Replicated query table can not be temporary
- Error 4189: Versioned table: adding HISTORY partition(s) failed
- Error 4190: is implicitly changing the value of from to
- Error 4191: CHANGE MASTER TO option is missing requirement

- Error 4192: Slave log event execution was interrupted (slave_max_statement_time exceeded)
- Error 4193: Invalid value for keyword
- Error 4194: keyword is not supported
- Error 4195: Variable schema is not supported
- Error 4196: Pseudo thread id should not be modified by the client as it will be overwritten
- Error 4197: Wrong number of columns
- Error 4198: Sequence tables cannot have any keys
- Error 4199: Sequence tables cannot have any constraints

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 4204: Invalid binary vector format

Error Code	SQLSTATE	Error	Description
4204		ER_VECTOR_BINARY_FORMAT_INVALID	Invalid binary vector format. Must use IEEE standard float representation in little-endian format. Use VEC_FromText() to generate it.

Possible Causes and Solutions

Argument is not a Valid Binary Vector

For example, the VEC_ToText function expects a binary vector. If not given one, this error will result:

```
SELECT VEC_ToText(x'aabbcc');
+-----------------------+
| VEC_ToText(x'aabbcc') |
+-----------------------+
| NULL                  |
+-----------------------+
1 row in set, 1 warning (0.000 sec)

Warning (Code 4204): Invalid binary vector format. Must use IEEE standard float
  representation in little-endian format. Use VEC_FromText() to generate it.
```

The solution is to provide a valid binary vector:

```
SELECT VEC_ToText(x'e360d63ebe554f3fcdbc523f4522193f5236083d');
+-----------------------------------------------------------+
| VEC_ToText(x'e360d63ebe554f3fcdbc523f4522193f5236083d') |
+-----------------------------------------------------------+
| [0.418708,0.809902,0.823193,0.598179,0.033255]          |
+-----------------------------------------------------------+
```

This page is licensed: CC BY-SA / Gnu FDL

Error 4205: Invalid vector format at offset

Error Code	SQLSTATE	Error	Description
4205		ER_VECTOR_FORMAT_INVALID	Invalid vector format at offset: %d for '%-.100s'. Must be a valid JSON array of numbers.

Possible Causes and Solutions

This page is licensed: CC BY-SA / Gnu FDL

Error 4206: Cannot determine distance type for VEC_DISTANCE, index is not found

Error Code	SQLSTATE	Error	Description
4206		ER_VEC_DISTANCE_TYPE	Cannot determine distance type for VEC_DISTANCE, index is not found

Possible Causes and Solutions

Table is Built Without a Vector Index

```
CREATE OR REPLACE TABLE v (id INT PRIMARY KEY, v VECTOR(5) NOT NULL);

INSERT INTO v VALUES
    (1, x'e360d63ebe554f3fcdbc523f4522193f5236083d'),
    (2, x'f511303f72224a3fdd05fe3eb22a133ffae86a3f'),
    (3,x'f09baa3ea172763f123def3e0c7fe53e288bf33e'),
    (4,x'b97a523f2a193e3eb4f62e3f2d23583e9dd60d3f'),
    (5,x'f7c5df3e984b2b3e65e59d3d7376db3eac63773e'),
    (6,x'de01453ffa486d3f10aa4d3fdd66813c71cb163f'),
    (7,x'76edfc3e4b57243f10f8423fb158713f020bda3e'),
    (8,x'56926c3fdf098d3e2c8c5e3d1ad4953daa9d0b3e'),
    (9,x'7b713f3e5258323f80d1113d673b2b3f66e3583f'),
    (10,x'6ca1d43e9df91b3fe580da3e1c247d3f147cf33e');

SELECT id FROM v ORDER BY VEC_DISTANCE(v, x'6ca1d43e9df91b3fe580da3e1c247d3f147cf33e');
ERROR 4206 (HY000): Cannot determine distance type for VEC_DISTANCE, index is not found
```

To solve, add a vector index to the table:

```
ALTER TABLE v ADD VECTOR INDEX(v);

SELECT id FROM v ORDER BY VEC_DISTANCE(v, x'6ca1d43e9df91b3fe580da3e1c247d3f147cf33e');
+----+
| id |
+----+
| 10 |
|  7 |
|  3 |
|  9 |
|  2 |
|  1 |
|  5 |
|  4 |
|  6 |
|  8 |
+----+
```

Error 4226: Slave SQL thread aborted

Error Code	SQLSTATE	Error	Description
4226		ER_INIT_SLAVE_ERROR	Slave SQL thread aborted. Can't execute init_slave query due to error code %u: %s

Possible Causes and Solutions

Prior to the introduction of this error, there were multiple error codes reported for the issue 'Can't execute init_slave query'. Those errors are the underlying reason the init_slave query cannot be executed, but this made it difficult to detect the issue in an automated way.

This error code, ER_INIT_SLAVE_ERROR, unifies all the errors related to the init_slave query. The ER_INIT_SLAVE_ERROR error is raised for any issue related to the init_slave query, and the underlying error code and message are included in the Last_SQL_Error field. See those specific errors for more details.

Possible Causes and Solutions

Client/Server Protocol

Client/Server Protocol Overview

See Protocol Data Types.

This page defines the fundamental data types used in the MariaDB client/server protocol, including integers, strings, and binary representations.

See MariaDB Protocol Differences with MySQL.

Learn about the specific extensions and differences in the MariaDB protocol compared to MySQL, such as extended capability flags and metadata.

Client/Server Protocol Documentation

See 0 - Packet.

Understand the standard packet structure in the MariaDB protocol, including the packet header, length, sequence number, and payload handling.

See 1 - Connecting.

Learn about the connection phase in the client/server protocol. This section details how clients establish initial communication with the server, including handshaking and authentication processes.

See 2 - Text Protocol.

Understand the text protocol in the Server's client/server communication. This section details how SQL commands and results are exchanged as plain text, including command types and packet structures.

See 3 - Binary Protocol (Prepared Statements).

Understand the binary protocol for prepared statements. This section details how prepared statements are exchanged efficiently between client and server, optimizing performance and security.

See 4 - Server Response Packets.

Understand server response packets in MariaDB's client/server protocol. This section details the various types of packets sent by the server, including OK, Error, and Result Set packets.

Replication Protocol Documentation

See Replication Protocol.

Understand the replication protocol. This section details how primary and replica servers communicate, exchanging binary log events to ensure data consistency and enable high availability.

This page is licensed: CC BY-SA / Gnu FDL

Protocol Data Types

List of Possible Types

Unknown type:

byte<1>	Fixed-length bytes
byte<lenenc>	Length-encoded bytes
byte<EOF>	End-of-file length bytes

Integer type:

int<1>	Fixed-length integers
int<lenenc>	Length-encoded integers

String type:

string<fix>	Fixed-length strings
string<NUL>	Null-terminated strings
string<lenenc>	Length-encoded strings
string<EOF>	End-of-file length strings

Fixed-Length Bytes

The notation is `byte <n>`, where `<n>` is a positive integer. A fixed-length byte stores the value in a series of `n` bytes.

Length-Encoded Bytes

The notation is `byte<lenenc>`. Length-encoded bytes are prefixed by a length-encoded integer which describes the length of the byte value, followed by the bytes value.

End of File Length Bytes

The notation is `byte<EOF>`. Bytes whose length is calculated by the packet remaining length.

Fixed-Length Integers

Notation is `int <n>`, where `<n>` is a positive integer. A fixed-length integer stores the value in a series of `n` bytes. The least significant byte is always the first byte (little-endian format).

Example

An `int<4>` with value of `2` is stored as `02 00 00 00` .

Length-Encoded Integers

The notation is `int<lenenc>`. An integer which depending on its value is represented by `n` bytes.

The first byte represents the size of the integer, depending on the value of the first byte:

- < `0xFB` - Integer value is this a 1-byte integer
- `0xFB` - `NULL` value
- `0xFC` - Integer value is encoded in the next 2 bytes (3 bytes total)
- `0xFD` - Integer value is encoded in the next 3 bytes (4 bytes total)
- `0xFE` - Integer value is encoded in the next 8 bytes (9 bytes total)

Fixed-Length Strings

The notation is `string<fix>`. Fixed-length strings have a known hardcoded length.

Null-Terminated Strings

The notation is `string<NUL>`. Null-terminated strings have a variable size and are terminated by a `0x00` character.

Length-Encoded Strings

The notation is `string<lenenc>`. Length-encoded strings are prefixed by a length-encoded integer which describes the length of the string, followed by the string value.

Example

An string of 512 “a” is encoded in 515 bytes:

```
fc 00 02 97 97 97 97 97 97 97 97 97 97 97 97 ² .. a a a a a a a a a a a a a
```

The `NULL` value is encoded using null (`0xfb`) length.

An empty value is encoded with a 0 (`0x00`) length.

End of File Length Strings

The notation is `string<EOF>`.

Strings whose length is calculated by the packet remaining length. For an example, see the COM_STMT_PREPARE packet.

This page is licensed: CC BY-SA / Gnu FDL

MariaDB Protocol Differences with MySQL

Here is a list of the differences between MariaDB and MySQL in terms of protocol, in order to help community driver maintainers.

MariaDB Capabilities Extension

MariaDB/MySQL servers can advertise feature support using capabilities. To expand the capabilities beyond the original 4 bytes, MariaDB utilizes 4 bytes, unused by MySQL, in the Initial handshake packet (server capabilities 3rd part). In order to avoid incompatibility in the future, those 4 bytes have to be read only if capability `CLIENT_MYSQL` is not set (server then being MariaDB).

Enhanced Capabilities

- `MARIADB_CLIENT_PROGRESS` : Client progress reporting.
- `MARIADB_CLIENT_CACHE_METADATA` : Enables clients to cache metadata and avoid repeated network transmissions (since MariaDB 10.6.0).
- `MARIADB_CLIENT_EXTENDED_METADATA` : Provides more detailed column metadata information for specific data types (since MariaDB 10.5.2).
- `MARIADB_CLIENT_STMT_BULK_OPERATIONS` : Introduces a dedicated command, COM_STMT_BULK_EXECUTE, for efficient batch execution of statements.
- MARIADB_CLIENT_BULK_UNIT_RESULTS: Allows for individual result sets for each bulk operation (since MariaDB 11.5.1).

See Connection Capabilities.

Prepare Statement Skipping Metadata

> **Note:**
>
> This feature is available from *MariaDB 10.6.0.*

Prepared statement metadata, which typically remains unchanged except during table alterations, can be cached by clients when the `MARIADB_CLIENT_CACHE_METADATA` capability is enabled. The server won't then send them again, unless they change. This significantly improves the performance of subsequent executions, especially for large metadata sets.

When `MARIADB_CLIENT_CACHE_METADATA` capability is set, the result set Column count packet format indicates if metadata follows or is skipped:

- `int<lenenc>` column count,
- if (`MARIADB_CLIENT_CACHE_METADATA` capability set) `int<1>` metadata follows (0 / 1).

Example

Java code:

```
stmt.execute("CREATE TABLE test_table (id int, val varchar(32))");
stmt.execute("INSERT INTO test_table VALUES (1, 'a'), (2, 'b')");
try (PreparedStatement prep = sharedConnBinary.prepareStatement("SELECT * FROM test_table WHERE id = ?"))
{
    prep.setInt(1, 1);
    prep.executeQuery();
}
```

Results with metadata caching:

```
Column count packet:
       +-------------------------------------------------+
       |  0  1  2  3  4  5  6  7   8  9  a  b  c  d  e  f |
+------+-------------------------------------------------+------------------+
|000000| 02 00 00 01 02 00                               | ......           |
+------+-------------------------------------------------+------------------+
row:
       +-------------------------------------------------+
       |  0  1  2  3  4  5  6  7   8  9  a  b  c  d  e  f |
+------+-------------------------------------------------+------------------+
|000000| 08 00 00 02 00 00 01 00  00 00 01 61            | ...........a     |
+------+-------------------------------------------------+------------------+

OK_Packet with a 0xFE header:
       +-------------------------------------------------+
       |  0  1  2  3  4  5  6  7   8  9  a  b  c  d  e  f |
+------+-------------------------------------------------+------------------+
|000000| 07 00 00 03 FE 00 00 22  00 00 00               | .......".....    |
+------+-------------------------------------------------+------------------+
```

The same, without metadata caching:

```
Column count packet:
       +-------------------------------------------------+
       |  0  1  2  3  4  5  6  7   8  9  a  b  c  d  e  f |
+------+-------------------------------------------------+------------------+
|000000| 01 00 00 01 02                                  | .....            |
+------+-------------------------------------------------+------------------+

Column Definition packet:
       +-------------------------------------------------+
       |  0  1  2  3  4  5  6  7   8  9  a  b  c  d  e  f |
+------+-------------------------------------------------+------------------+

|000020| 61 62 6C 65 03 76 61 6C  03 76 61 6C 0C FF 00 80 | able.val.val.... |
|000030| 00 00 00 FD 00 00 00 00  00                     | .........        |
+------+-------------------------------------------------+------------------+

row:
       +-------------------------------------------------+
       |  0  1  2  3  4  5  6  7   8  9  a  b  c  d  e  f |
+------+-------------------------------------------------+------------------+
|000000| 08 00 00 04 00 00 01 00  00 00 01 61            | ...........a     |
+------+-------------------------------------------------+------------------+

OK_Packet with a 0xFE header:
       +-------------------------------------------------+
       |  0  1  2  3  4  5  6  7   8  9  a  b  c  d  e  f |
+------+-------------------------------------------------+------------------+
|000000| 07 00 00 05 FE 00 00 22  00 00 00               | .......".....    |
+------+-------------------------------------------------+------------------+
```

Extended Column Information

> **Note:**
>
> This feature is available from MariaDB 10.5.2.

When the `MARIADB_CLIENT_EXTENDED_METADATA` capability is set, column definition packet can include additional type and format information.

- For geometric fields: Detailed geometric data type (for instance, `point`, `polygon`).
- For JSON fields: Type `json`.
- For UUID fields: Type `uuid`.

Bulk

> **Note:**
>
> This feature is available for unit results from MariaDB 10.2.0 or MariaDB 11.5.1, respectively.

The `MARIADB_CLIENT_STMT_BULK_OPERATIONS` capability enables the COM_STMT_BULK_EXECUTE command for efficient batch processing. However, note that only one result (`OK` or `ERROR`) is returned per batch, containing the total affected rows and the first auto-generated ID. For individual results, the `MARIADB_CLIENT_BULK_UNIT_RESULTS` capability can be set. The server will then return a result set containing for each unitary results (containing auto generated ids and affected rows).

Example

Java code:

```
Statement stmt = connection.createStatement();
stmt.execute("CREATE TABLE test_table (id int, val varchar(32))");

try (PreparedStatement prep = connection.prepareStatement("INSERT INTO test_table VALUES (?, ?)")) {

    prep.setInt(1, 1);
    prep.setString(2, "a");
    prep.addBatch();

    prep.setInt(1, 2);
    prep.setString(2, "b");
    prep.addBatch();

    prep.executeBatch();
}
```

Client send:

```
MARIADB_CLIENT_STMT_BULK_OPERATIONS:
       +-------------------------------------------------+
       |  0  1  2  3  4  5  6  7   8  9  a  b  c  d  e  f |
+------+-------------------------------------------------+------------------+
|000000| 1B 00 00 00 FA FF FF FF  FF 80 00 03 00 FD 00 00 | ................ |
|000010| 01 00 00 00 00 01 61 00  02 00 00 00 00 01 62    | ......a.......b  |
+------+-------------------------------------------------+------------------+
```

Server response:

```
OK_Packet:
       +-------------------------------------------------+
       |  0  1  2  3  4  5  6  7   8  9  a  b  c  d  e  f |
+------+-------------------------------------------------+------------------+
|000000| 2E 00 00 01 00 02 00 02  00 00 00 26 52 65 63 6F | ...........&Reco |
|000010| 72 64 73 3A 20 32 20 20  44 75 70 6C 69 63 61 74 | rds: 2  Duplicate |

|000030| 20 30                                           |  0               |
+------+-------------------------------------------------+------------------+
```

Authentication Plugins

MariaDB has specific authentication methods.

- ED25519 plugin
- PARSEC plugin (from MariaDB 11.6.1)
- GSSAPI plugin

Redirection

> **Note:**
>
> This feature is available from MariaDB 11.3.1 or MaxScale 25.08.0, respectively.

MariaDB permits connection redirection.

Use Cases

- Proxy Scenarios: Connection redirection is particularly beneficial when multiple servers share a single proxy.
- Server Management: This feature can also be used during planned server shutdowns or restarts, allowing for a graceful transition to a new server.

Connectors can support 2 different levels:

- On Connection Creation only: The redirection information is included in the initial OK_Packet sent by the server to the client. This allows the client to connect directly to the target server immediately.
- Anytime Redirection: If redirection information becomes available later, the connector can handle it based on the existing transaction state.
  - No Transaction: If no transaction is in progress, the connector can redirect the connection directly.
  - Transaction in Progress: If a transaction is ongoing, the redirection information is stored until the transaction is completed. The transaction state is determined using server status flags like `SERVER_STATUS_IN_TRANS` in the `OK_Packet`, `ERR_Packet`, or `EOF_Packet`.

Zero-Configuration SSL

> **Note:**
>
> This feature is available from MariaDB 11.4.1.

A feature that enables TLS certificate validation without requiring client-side certificate configuration.

Limitations

- Requires a nonempty password.
- Only supports the following authentication methods:
  - `mysql_native_password`
  - `client_ed25519`

- `parsec`

Operational Mechanism

Server-Side Process

1. When no SSL certificates are pre-configured, the server automatically generates a temporary self-signed certificate.
2. During connection establishment, the server embeds a special validation hash in the connection's `OK_Packet` information field.

Client-Side Process

1. The client connector must postpone SSL error handling until the connection phase is complete.
2. The client captures and stores the SHA256 fingerprint of the server's certificate.
3. If SSL errors occur, the client can only use specific authentication plugins (`mysql_native_password` / `ed25519` / `parsec`) to prevent potential password exposure.
4. At connection conclusion, the server sends an `OK_Packet` with a validation hash.
5. The client generates a hash using:

- The password hash;
- The server's seed;
- Stored certificate fingerprint.

> **Warning:**
>
> The SSL-error connection proceeds only if the client-generated hash matches the server-provided hash.

Password Hash Generation Methods

- `mysql_native_password`:
  - Hash generation: `SHA1`(`SHA1`(*password*)).
- `ed25519`:
  - Uses the Ed25519 cryptographic algorithm for hash generation.
- `parsec`:
  - Hash generation involves combining
    - `P` character;
    - Number of iterations;
    - Salt;
    - Raw public key.

Initial Session Tracking

MySQL and MariaDB support session tracking when the `CLIENT_SESSION_TRACK` capability is set.

> **Note:**
>
> One difference is that, since MariaDB 11.5.1, connection ending `OK_Packet` lists all the current variables of tracked variable.

This is useful for connectors which have a method to set the transaction type, retrieving database for example to always have the server current value when changed. This permits to avoid executing some queries when not needed.

Example of ending connection `OK_Packet` :

```
+-------------------------------------------------+
       |  0  1  2  3  4  5  6  7   8  9  a  b  c  d  e  f |
+------+-------------------------------------------------+------------------+
|000000| A6 00 00 02 00 00 00 02  40 00 00 00 9D 00 0E 0A | ........@....... |
|000010| 61 75 74 6F 63 6F 6D 6D  69 74 02 4F 4E 00 11 09 | autocommit.ON... |
|000020| 74 69 6D 65 5F 7A 6F 6E  65 06 53 59 53 54 45 4D | time_zone.SYSTEM |
|000030| 00 1D 14 63 68 61 72 61  63 74 65 72 5F 73 65 74 | ...character_set |
|000040| 5F 63 6C 69 65 6E 74 07  75 74 66 38 6D 62 34 00 | _client.utf8mb4. |
|000050| 21 18 63 68 61 72 61 63  74 65 72 5F 73 65 74 5F | !.character_set_ |
|000060| 63 6F 6E 6E 65 63 74 69  6F 6E 07 75 74 66 38 6D | connection.utf8m |
|000070| 62 34 00 1E 15 63 68 61  72 61 63 74 65 72 5F 73 | b4...character_s |
|000080| 65 74 5F 72 65 73 75 6C  74 73 07 75 74 66 38 6D | et_results.utf8m |
|000090| 62 34 00 0E 0C 72 65 64  69 72 65 63 74 5F 75 72 | b4...redirect_ur |
|0000a0| 6C 00 01 06 05 74 65 73  74 6A                   | l....testj       |
+------+-------------------------------------------------+------------------+
```

It indicates:

- autocommit = ON
- time_zone = SYSTEM
- character_set_client = utf8mb4
- character_set_connection = utf8mb4
- character_set_results = utf8mb4
- redirect_url =

A connector knows that, if `character_set_client` is set to `utf8mb4`, it can avoid executing a statement like `SET NAMES utf8mb4`.

MySQL Features Not Supported

- The X protocol is not supported.

Unsupported features and associate capabilities:

- `CLIENT_OPTIONAL_RESULTSET_METADATA`: permits setting no `METADATA` at all for a connection. See Prepare statement skipping metadata's MariaDB implementation choice.
- `CLIENT_QUERY_ATTRIBUTES` adds some metadata attributes.
- `CLIENT_ZSTD_COMPRESSION_ALGORITHM` permits zstd compression.
- `MULTI_FACTOR_AUTHENTICATION` Multifactor Authentication capability.

TIPS

Identifying MariaDB Server

MariaDB connectors use specific criteria to determine if a server is a MariaDB instance during the initial handshake process.

The two key indicators used are:

- Missing `CLIENT_MYSQL` capability: MariaDB does not set the `CLIENT_MYSQL` capability flag in the initial handshake packet.
- Server version string: The server's version string is examined for the presence of the word *mariadb* (ignoring case sensitivity).

The reason is that some features like using `COM_RESET_CONNECTION` have no capability, and depend on the MySQL or MariaDB server version.

Pipelining Prepare Execute

Connectors usually follow a two-step process for prepared statements:

1. Prepare: Send a COM_STMT_PREPARE command to the server, receiving a statement ID in response.
2. Execute: Send a COM_STMT_EXECUTE command, using the statement ID obtained in the previous step.

When the server support `MARIADB_CLIENT_STMT_BULK_OPERATIONS` capability, a specific statement ID value of `-1` (or `0xffffffff` in hexadecimal) can be used to indicate that the previously prepared statement can be reused. This enables connectors to pipeline the preparation and execution steps into a single request:

- Send a COM_STMT_PREPARE, then a COM_STMT_EXECUTE with statement ID `-1` (`0xffffffff`) command, to the server.
- Read the prepare and execute responses.

If the COM_STMT_PREPARE command returns an error (`ERR_Packet`), the subsequent COM_STMT_EXECUTE with statement ID `-1` also fails and returns an error.

By eliminating the round trip for the separate `COM_STMT_EXECUTE` command, this approach improves performance for the first execution.

Traditionally, connectors send COM_STMT_PREPARE, wait for results, then execute COM_STMT_EXECUTE with `statement_id` received from the prepare result.

This description is for COM_STMT_EXECUTE, but COM_STMT_BULK_EXECUTE works exactly the same way.

Query Timeout

A timeout for all commands can be set using `SET max_statement_time=` *`XXX`* with *`XXX`* in seconds.

Setting it for a specific query can be done using `SET STATEMENT max_statement_time=XXX FOR ...`

Collations

Connectors don't care about collations, but normally want to ensure charset in connection exchanges.

The only good solution is to use `SET NAMES utf8mb4` or `SET NAMES utf8mb4 COLLATE someUtf8mb4collation`.

If they support session tracking, connectors can check if the character set of initially tracked variable `character_set_connection` corresponds to the expected value, then permit skipping this `SET NAMES` statement ('server default collation' from initial handshake packet cannot be trusted, since truncated to one byte. Recent mysql and mariadb collation can go on 2 bytes).

0 - Packet

Client/server exchanges are done using the following format:

Standard Packet

The standard MySQL/MariaDB packet has a 4-byte header and a packet body:

- int<3> packet length;
- int<1> sequence number;
- byte<n> packet body.

Packet length is the length of the packet body. Packet length size cannot be more than 3 bytes length value. The actual length of the packet is calculated as from the 3 bytes as length:

```
byte[0] + (byte[1]<<8) + (byte[2]<<16)
```

The maximum size of a packet (with all 3 bytes `0xff`) is 16777215 , or 2^24-1 or `0xffffff`, or 16MB-1 byte.

The sequence number indicates the exchange number when an exchange demands different exchanges. Whenever the client sends a query, the sequence number is set to 0 initially, and is incremented if clients need to split packets.

In more complex situations, when the client and server exchange several packets, for instance, authentication handshake, the rule of thumb for clients is to set sequence number = (last seq.number from received server packet + 1).

Example: Sending a COM_PING packet COM_PING body has only one byte (`0x10`):

```
01 00 00 00 10
```

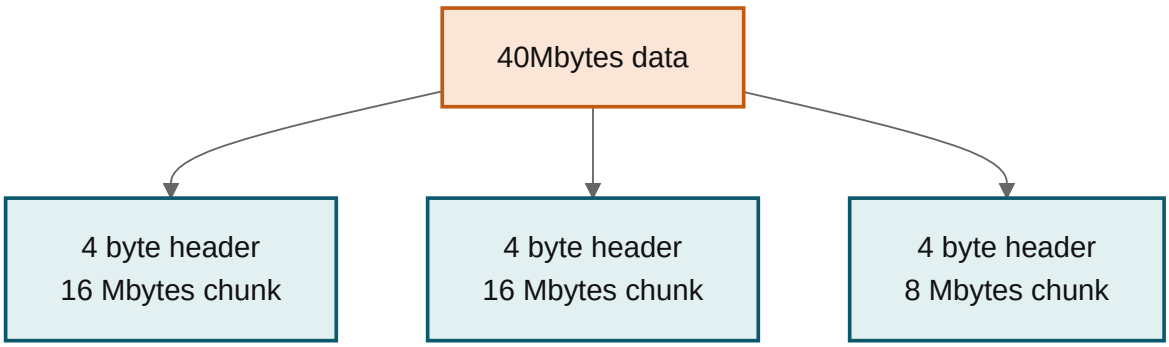
The server then returns an OK_Packet response with a sequence number of `1`.

Packet Splitting

The packet length is 3 bytes, making a maximum size of (2^24 -1) bytes or 16Mbytes-1 byte. But the protocol allows sending and receiving larger data. For those cases, the client can send many packets for the same data, incrementing the sequence number for each packet.

The principle is to split data by chunks of 16M bytes. When the server receives a packet with `0xffffff` length, it will continue to read the next packet. In case of a length of exactly 16M bytes, an empty packet must terminate the sequence.

Example: `max_allowed_packet` is set to a value > to 40M bytes. Sending a 40M bytes packet body:



A 40 Mbyte packet body split across three standard packets: 4-byte header + 16 Mbytes, 4-byte header + 16 Mbytes, 4-byte header + 8 Mbytes.

First packet:

```
ff ff ff 00 ...
```

Second packet:

```
ff ff ff 01 ...
```

Third packet:

```
02 00 80 02 ...
```

The client must be aware of the max_allowed_packet variable value. The server has a buffer to store the body with a maximum size corresponding to this `max_allowed_packet` value. If the client sends more data than

`max_allowed_packet` size, the socket is closed.

> **Note:**
>
> Note that data of exact size 2^24 -1 byte must be sent in 2 packets, the first one with length prefix `0xffffff`, and the second one with length 0 (length byte `0x000000`, seqno incremented). Generally, if data length is an exact multiple of 2^24-1, it must always be followed by an empty packet.

Compressed Packet

For slow connections, the packet can be compressed. This is activated after the handshake-response-packet when the client indicates a `[[1-connecting-connecting#capabilities|COMPRESS]` capability with the server having this functionality, too.

When activated, packets are composed of 7 bytes, a compress header and data. The compression algorithm used is ZLIB, widely available and supported by many languages and runtimes.

- int<3> compressed packet length;
- int<1> compression protocol sequence number;
- int<3> uncompress body length;
- byte<n> compressed body;
  - compressed body contains one or many standard packets but partial packets can also be sent:
    - one or many standard packets :
      - int<3> packet length
      - int<1> sequence number
      - byte<n> packet body

Since compress body can contain many “standard packets”, compress sequence number is incremented separately from sequence number. If the length of the uncompressed payload exceeds `0xffffff` bytes, the uncompressed payload must be sent in several compressed protocol packets.

For small packets, using compression isn’t efficient, so the client can choose to send uncompressed data. That is done by setting the compressed packet length to the real length and the uncompressed packet length to `0`. (Data must then be uncompressed).

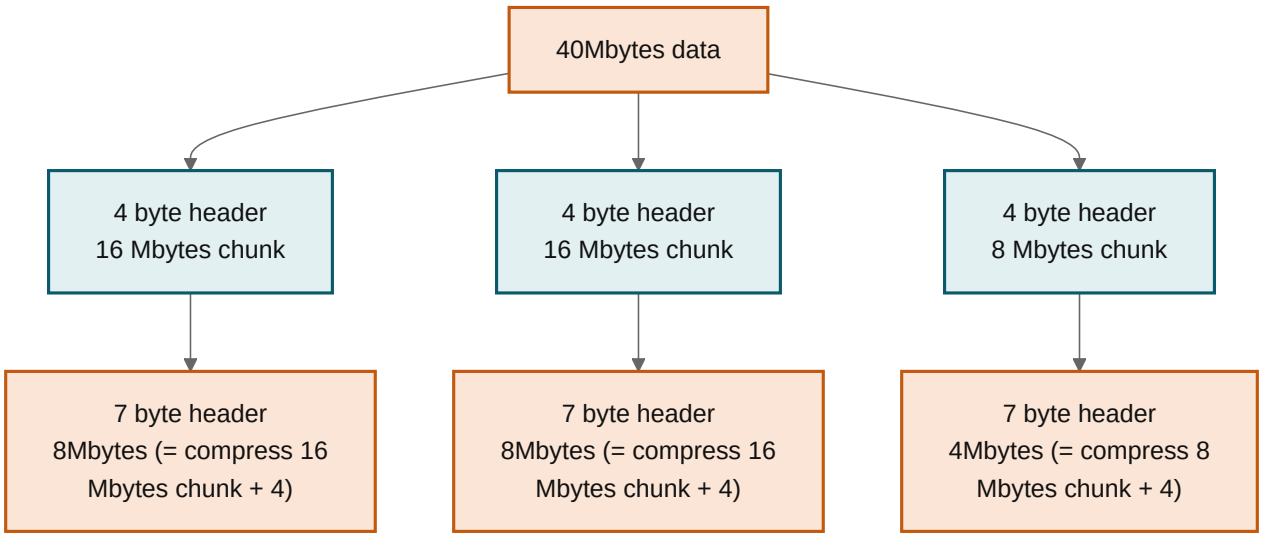
Example: Sending a COM_PING packet `COM_PING` body when `COMPRESS` is enabled. This is 1 byte of data that has then no reason to be compressed, so:

```
01 00 00 00 00 00 00 01 00 00 00 10
```

The server returns an OK_Packet response with a compress sequence number of `1`, and a sequence number of `1`.

Compression Packet Splitting

The server uncompresses data, and then must have the same packet as if there was no compression. If data size needs splitting, it’s better to separate compress packet.



Each standard packet from the 40 Mbyte split is re-wrapped in a 7-byte-header compressed packet whose body size equals the compressed chunk plus its 4-byte header.

1 - Connecting

See Connecting.

The connection phase involves an initial handshake where the client and server exchange capabilities, default settings, and authentication data to establish a session.

See Connecting via sha256_password.

The sha256_password plugin manages authentication using SHA-256 encryption, supporting both clear text passwords over SSL and RSA encrypted password exchange.

See Connecting via caching_sha2_password.

This plugin implements the caching_sha2_password authentication method, using an in-memory cache for fast authentication or RSA encryption for full verification.

This page is licensed: CC BY-SA / Gnu FDL

Connecting

Overview

Connection is done by many exchanges:

- (Create socket)
- If first byte from server is `0xFF`:
  - Packet is an ERR_Packet, socket has to be closed.
- Else:
  - Packet is an Initial handshake packet.
  - If SSL/TLS connection:
    - Client sends SSLRequest packet and switches to SSL mode for sending and receiving the following messages:
  - Client sends Handshake response packet.

- Server sends either:
  - An `OK` packet in case of success OK_Packet.
  - An error packet in case of error ERR_Packet.
  - Further authentication data, if requested by the authentication plugin.
    - The content of this authentication data is defined by the authentication plugin.
    - The server *may* send `0x01` byte first to escape the authentication data, particularly if the data starts with the `0x00` or `0xFE` or `0XFF` byte.
    - This optional first `0x01` byte must always be skipped by the client.
  - Authentication switch:
    - If the client or server doesn't have `PLUGIN_AUTH` capability:
      - Server sends `0xFE` byte.
      - Client sends `old_password`.
    - Else:
      - Server sends Authentication switch request.
      - Client may have many exchanges with the server according to the Plugin.
    - Authentication switch ends with server sending either OK_Packet or ERR_Packet.

Initial Handshake Packet

- int<1> protocol version.
- string<NUL> server version:
  - MariaDB Server 10.X versions are by default prefixed "5.5.5-".
  - MariaDB 11.0 and later versions do not have a "5.5.5-" default prefix.
- int<4> connection id.
- string<8> authentication plugin data (1st part).
- string<1> reserved byte.
- int<2> server capabilities (1st part).
- int<1> server default collation.
- int<2> status flags.
- int<2> server capabilities (2nd part).
- If (`server_capabilities` & `PLUGIN_AUTH`):
  - int<1> plugin data length.
- Else:
  - int<1> `0x00`.
- string<6> filler.
- If (`server_capabilities` & `CLIENT_MYSQL`):
  - string<4> filler.
- Else:
  - int<4> server capabilities 3rd part. MariaDB specific flags `/* MariaDB 10.2 or later */`.
- If (`server_capabilities` & `CLIENT_SECURE_CONNECTION`):
  - string<n> authentication plugin data 2nd part. Length = max(12, plugin data length - 9).
  - string<1> reserved byte.
- If (server_capabilities & PLUGIN_AUTH):
  - string<NUL> authentication plugin name.

Client Handshake Response

If the client requests a TLS/SSL connection, the first response is an SSL connection request packet, followed by a handshake response packet. If no TLS is required, client directly sends a handshake response packet.

SSLRequest Packet

- int<4> client capabilities.
- int<4> max packet size.
- int<1> client's default character set and collation.
- string<19> reserved.
- If not (`server_capabilities` & `CLIENT_MYSQL`):
  - int<4> extended client capabilities
- Else:
  - string<4> reserved.

Zero-Configuration SSL Encryption

Automatic Encrypted Connections (MariaDB 11.4+):

Previously, failed SSL connections due to self-signed certificates prevented communication. MariaDB 11.4+ introduces a secondary validation method that works for all servers.

What Happens When SSL Validation Fails?

Even without a valid SSL certificate, the connector can still authenticate by remembering the server's fingerprint (unique identifier). However, it needs to confirm the connection is secure.

Verifying a Secure Connection

The confirmation method depends on the connection type. When using secure MitM-proof methods, like Unix sockets, connector can automatically validate the connection. Otherwise, a shared secret is used.

Shared Secret for Secure Connection

The shared secret is only used if the authentication plugin password is hashable (for instance, `mysql_native_password` , `client_ed25519` , or `parsec`) and not empty.

It's calculated by hashing the user's hash password with the authentication seed and the server fingerprint.

Password hash is generated depending on authentication plugin:

- `ed25519` : identical to password encryption.
- `mysql_native_password` : identical to password encryption.
- `parsec` : ext-salt + raw ed25519 public key.

Server 11.4+ Confirmation Details

For servers running MariaDB 11.4 or later, the final confirmation packet contains:

- int<1> encryption (actually only 0x01 = SHA256 encryption)
- byte<EOF> shared secret.

Matching the Shared Secret

If the calculated shared secret matches the received one, the SSL connection is considered valid (host validation is not needed). Otherwise, the connection must be closed for security reasons.

Handshake Response Packet

- int<4> client capabilities.
- int<4> max packet size.
- int<1> client's default character set and collation.
- string<19> reserved.
- If not (`server_capabilities` & `CLIENT_MYSQL`):
  - int<4> extended client capabilities.
- Else:
  - string<4> reserved.
- string<NUL> username.
- If (password):
  - If (`server_capabilities` & `PLUGIN_AUTH_LENENC_CLIENT_DATA`):
    - string<lenenc> authentication data.
  - Else if (`server_capabilities` & `CLIENT_SECURE_CONNECTION`):
    - int<1> length of authentication response.
    - string<fix> authentication response (length is indicated by previous field).
  - Else:
    - string<NUL> authentication response null ended.
- Else:
  - `string<1>\0` (empty password).
- If (`server_capabilities` & `CLIENT_CONNECT_WITH_DB`):
  - string<NUL> default database name.
- If (`server_capabilities` & `CLIENT_PLUGIN_AUTH`):
  - string<NUL> authentication plugin name.
- If (`server_capabilities` & `CLIENT_CONNECT_ATTRS`):
  - int<lenenc> size of connection attributes.
  - While packet has remaining data:
    - string<lenenc> key.
    - string<lenenc> value.

Server Response to Handshake Response Packet

If the authentication plugin needs further rounds of data exchange (like `parsec`), the server sends additional plugin authentication data (optionally prefixed with `0x01`) to which the client sends an additional response. This can be repeated in multiple rounds. It ends with one of the following:

The server responds with an OK_packet, an ERR_packet, or an Authentication Switch Request packet.

Authentication Switch Request

(If client and server support `CLIENT_AUTH` capability):

- int<1> `0xFE` : Authentication switch request header.
- string<NUL> authentication plugin name.
- byte<EOF> authentication plugin data.

Plugin List

mysql_old_password Plugin

deprecated — send an 8 byte encrypted password.

Authentication plugin data format:

- byte<8> 8-byte seed.

Client response:

- string<NUL> old format encrypted password.

mysql_clear_password Plugin

> **Important:**
>
> Since the password is transmitted in clear, this must be used only when using SSL connections.

Send clear password to server.

Client response:

- string<NUL> password without encryption.

mysql_native_password Plugin

SHA-1 encrypted password with server seed.

Authentication plugin data format:

- string<NUL> seed.

Client response:

- byte<EOF> `SHA1`-encrypted password.

The password is encrypted with: `SHA1( password ) ^ SHA1( seed + SHA1( SHA1( password ) ) )`.

dialog Plugin (PAM)

Interactive exchanges to permit fill passwords — for example for 2-step authentication.

Authentication plugin data format:

- byte<1> password type.
- string<EOF> prompt message.

The server can send one or many requests. For each of them, the client must display this prompt message to the user, to permit the user to type requested information, then send it to the server in string<NUL> format. Password type indicates the answer format (`2` means “read the input with the echo enabled”, `4` means “password-like input, echo disabled”).

First authentication format (from authentication switch packet) can be empty.

This end when the server sends an EOF_Packet, OK_Packet or ERROR_packet.

auth_gssapi_client Plugin

GSSAPI implementation.

Authentication plugin data format:

- string<NUL> serverPrincipalName (UTF-8 format).
- string<NUL> mechanisms (UTF-8 format).

Client must exchange packet with server until having a mutual GSSAPI authentication.
The only difference compared to standard client-server GSSAPI authentication is that exchanges contain standard protocol with packet headers.

client_ed25519 Plugin

The `ed25519` plugin uses the Elliptic Curve Digital Signature Algorithm to securely store users' passwords and to authenticate users.

See plugin description.

The server sends a random nonce that the client signs.

authentication plugin data format:

- byte<EOF> seed.

Client response:

- byte<EOF> `ed25519` encrypted password.

parsec Plugin

Authentication plugin data format:

- string<32> server nonce.

Client has to send an empty packet to request "ext-salt".

Format of ext-salt is:

- string<1> 'P' (denotes KDF algorithm = PBKDF2).
- byte<1> iteration factor. number of iterations correspond to 1024 << iteration factor (0x0 means 1024, 0x1 means 2048, etc.).
- byte<EOF> salt.

The client must then:

- Generate derived key = hash password with PBKDF2 (sha512 digest) with iteration number and salt from ext-salt.
- Generate a client 32 bytes nonce.
- Generate the signature with `ed25519` of an array concatenation of server nonce + client nonce with the generated derived key as private key.

Client response:

- byte<32> client nonce.
- byte<64> signature.

Capabilities

Server and Client have different capabilities, here is the possibles values.
client with capabilities CLIENT_MYSQL + CONNECT_WITH_DB will have a value of 9 (1 + 8).

Capability	Value	Details
CLIENT_MYSQL	1	Set by older MariaDB versions. MySQL named this `CLIENT_LONG_PASSWORD` .

Capability	Value	Details
FOUND_ROWS	2	
CONNECT_WITH_DB	8	You can specify database on connect.
COMPRESS	32	Can use compression protocol
LOCAL_FILES	128	Can use LOAD DATA LOCAL.
IGNORE_SPACE	256	Ignore spaces before `(`.
CLIENT_PROTOCOL_41	1 << 9	4.1 protocol.
CLIENT_INTERACTIVE	1 << 10	
SSL	1 << 11	Can use SSL.
TRANSACTIONS	1 << 13	
SECURE_CONNECTION	1 << 15	4.1 authentication.
MULTI_STATEMENTS	1 << 16	Enable/disable multi-statement support.
MULTI_RESULTS	1 << 17	Enable/disable multi-results.
PS_MULTI_RESULTS	1 << 18	Enable/disable multi-results for PrepareStatement.
PLUGIN_AUTH	1 << 19	Client supports plugin authentication.
CONNECT_ATTRS	1 << 20	Client sends connection attributes.
PLUGIN_AUTH_LENENC_CLIENT_DATA	1 << 21	Enable authentication response packet to be larger than 255 bytes.
CLIENT_CAN_HANDLE_EXPIRED_PASSWORDS	1 << 22	Client can handle expired passwords.
CLIENT_SESSION_TRACK	1 << 23	Enable/disable session tracking in `OK_Packet`.
CLIENT_DEPRECATE_EOF	1 << 24	`EOF_Packet` deprecation: `OK_Packet` replace `EOF_Packet` at the end of the result set when in text format. `EOF_Packet` between columns definition and `resultsetRows` is deleted.
CLIENT_OPTIONAL_RESULTSET_METADATA	1 << 25	Not in use for MariaDB.
CLIENT_ZSTD_COMPRESSION_ALGORITHM	1 << 26	Support `zstd` protocol compression.
CLIENT_CAPABILITY_EXTENSION	1 << 29	Reserved for future use.
CLIENT_SSL_VERIFY_SERVER_CERT	1 << 30	Client verify server certificate. Deprecated, client has options to indicate if server certificate must be verified.
CLIENT_REMEMBER_OPTIONS	1 << 31	
MARIADB_CLIENT_PROGRESS	1 << 32	Client support progress indicator.

Capability	Value	Details
MARIADB_CLIENT_COM_MULTI	1 << 33	deprecated - did permit `COM_MULTI` protocol.
MARIADB_CLIENT_STMT_BULK_OPERATIONS	1 << 34	Permit bulk insert.
MARIADB_CLIENT_EXTENDED_METADATA	1 << 35	Add extended metadata information.
MARIADB_CLIENT_CACHE_METADATA	1 << 36	Permit skipping metadata.
MARIADB_CLIENT_BULK_UNIT_RESULTS	1 << 37	When enabled, indicate that bulk command can use `STMT_BULK_FLAG_SEND_UNIT_RESULTS` flag that permits to return a result set of all affected rows and auto-increment values.

Native Password Authentication

The 20-byte string 'seed' is calculated by concatenating scramble first part (8 bytes) and scramble second part from Initial handshake packet. After that, the client calculates a password hash using the password and seed by using `^` (bitwise xor), `+` (string concatenation), and SHA1 as follows:

```
SHA1( passwd) ^ SHA1( seed + SHA1( SHA1( passwd ) ) )
```

This page is licensed: CC BY-SA / Gnu FDL

Connecting via sha256_password

Overview

`SHA256` authentication possible exchanges:

- If connection uses SSL (SSLRequest Packet sent):
  - Client sends a clear password answer.
- Else:
  - If client doesn't know server RSA public key:
    - Client sends a public key request.
    - Server sends a public key response.
  - Client sends an RSA encrypted password.
  - Ends with server sending either OK_Packet , ERR_Packet.

Authentication

Client Clear Password Answer

- string<NUL> password without encryption.

Public Key Request

- byte<1> fixed `0x01` value.

Public Key Response

- byte<1> fixed `0x01` value.
- byte<EOF> public key data.

RSA Encrypted Password

- byte<256> RSA encrypted password.

RSA encrypted value of `XOR`(password, seed) using server public key (`RSA_PKCS1_OAEP_PADDING`).

This page is licensed: CC BY-SA / Gnu FDL

Connecting via caching_sha2_password

Overview

Caching `SHA256` first sends an `SHA256` -encrypted password. MySQL server has an in-memory cache of `SHA256` key for successful authentication. When a cache hit occurs, the connection is validated, if not, using some more steps to a process similar to sha256_password.

Caching SHA256 authentication possible exchanges:

- Client sends an SHA-2 encrypted password.
- Server result is either OK_Packet , ERR_Packet, or “fast” authentication result.
- If fast authentication result:
  - If connection uses SSL (SSLRequest Packet sent):
    - Client sends a clear password answer.
  - Else:
    - If client doesn’t know server RSA public key:
      - Client sends a public key request.
      - Server sends a public key response.
    - Client sends an RSA encrypted password.
    - Ends with server sending either OK_Packet , ERR_Packet.

Authentication

SHA-2 Encrypted Password

Encryption is `XOR` (`SHA256` (password), `SHA256` (seed, `SHA256` (`SHA256` (password)))).

- byte<32> encrypted password.

“Fast” Authentication Result

Result of fast authentication.

- byte<lenenc> authentication result.

`0x03` value means success authentication.
`0x04` value means continue.

Client Clear Password Answer

- string<NUL> password without encryption.

Public Key Request

> **Warning:**
>
> Value send is not `0x01` like sha256_password use, but `0x02` .

- byte<1> fixed 0x02 value.

Public Key Response

- byte<1> fixed 0x01 value.
- byte<EOF> public key data.

RSA Encrypted Password

- byte<256> RSA encrypted password.

RSA encrypted value of `XOR` (password, seed) using server public key (`RSA_PKCS1_OAEP_PADDING`).

This page is licensed: CC BY-SA / Gnu FDL

2 - Text Protocol

See COM_CHANGE_USER.

This command allows a connected client to re-authenticate as a different user without closing and reopening the connection.

See COM_CREATE_DB.

This command creates a new database on the server, functionally equivalent to the SQL statement CREATE DATABASE.

See COM_DEBUG.

This command forces the server to dump debug information to the standard output or log, requiring the SUPER privilege.

See COM_DROP_DB.

This command drops an existing database from the server, functionally equivalent to the SQL statement DROP DATABASE.

See COM_FIELD_LIST.

This command retrieves a list of fields (columns) for a specified table, similar to the SHOW COLUMNS SQL statement.

See COM_INIT_DB.

This command selects the default database for the current connection, functionally equivalent to the USE statement.

See COM_PING.

This command checks if the server is alive and reachable, the server responds with an OK packet if it is running.

See COM_PROCESSLIST.

This command retrieves a list of active threads and their current status, similar to the SHOW PROCESSLIST statement.

See COM_PROCESS_KILL.

This command asks the server to terminate a specific connection thread, functionally equivalent to the KILL statement.

See COM_QUERY.

This command sends an SQL statement to the server for execution immediately, without the prepare/execute steps.

See COM_QUIT.

This command instructs the server to close the connection and release associated resources.

See COM_RESET_CONNECTION.

This command resets the session state (variables, tables, etc.) to its initial values without closing the connection.

See COM_SET_OPTION.

This command configures client-specific options for the current connection, such as enabling or disabling multi-statements.

See COM_SHUTDOWN.

This command requests the server to shut down, it requires the SHUTDOWN privilege to be executed successfully.

See COM_SLEEP.

This is an internal command used to represent a sleeping connection that is waiting for a new command from the client.

See COM_STATISTICS.

This command retrieves a human-readable string containing internal server statistics like uptime and thread counts.

This page is licensed: CC BY-SA / Gnu FDL

COM_CHANGE_USER

`COM_CHANGE_USER` resets the connection and re-authenticates with the given credentials. The packet is identical to the authentication packet in the connection handshake.

Fields

- int<1> `0x11` : `COM_CHANGE_USER` header.
- string<NUL> username.
- If (`server_capabilities` & `CLIENT_SECURE_CONNECTION`):
  - int<1> length of authentication response.
  - string authentication response.
- Else:
  - string<NUL> authentication response.
- string<NUL> default schema name.
- int<2> client character collation.
- If (`server_capabilities` & `CLIENT_PLUGIN_AUTH`):
  - string<NUL> authentication plugin name.
- If (`server_capabilities` & `CLIENT_CONNECT_ATTRS`):
  - int<lenenc> size of connection attributes.
  - Loop:
    - string<lenenc> key.
    - string<lenenc> value.

Response

Server response is like connection authentication :

- An `OK` packet in case of success OK_Packet.
- An error packet in case of error ERR_Packet.
- Authentication switch:
  - If the client or server doesn't have `PLUGIN_AUTH` capability:

        - Server sends `0xFE` byte.
        - Client sends `old_password`.
    - Else:
        - Server sends Authentication switch request.
        - Client may have many exchanges with the server according to the Plugin.
    - Authentication switch ends with server sending either OK_Packet or ERR_Packet.

If the authentication fails more than three times, all future `COM_CHANGE_USER` commands on the connection will return the `#08S01 Unknown command` error. This is an anti-brute-force mechanism designed to prevent rapid guessing of passwords.

This page is licensed: CC BY-SA / Gnu FDL

COM_CREATE_DB

> **Note:**
>
> This command is deprecated and not used by MariaDB connectors any more. Use the SQL statements CREATE SCHEMA or CREATE DATABASE instead.

This page is licensed: CC BY-SA / Gnu FDL

COM_DEBUG

The `COM_DEBUG` command forces the server to dump debug information to stdout. It requires the SUPER privilege.

Fields

- int<1> `0xOD` : `COM_DEBUG` header.

Response

EOF Packet.

This page is licensed: CC BY-SA / Gnu FDL

COM_DROP_DB

> **Note:**
>
> This command is deprecated and not used by MariaDB connectors any more. Use the SQL statements DROP SCHEMA or DROP DATABASE instead.

This page is licensed: CC BY-SA / Gnu FDL

COM_FIELD_LIST

> **Note:**
>
> This command is deprecated and not used by MariaDB connectors any more. Use the SQL statements SHOW COLUMNS or SELECT FROM INFORMATION_SCHEMA.COLUMNS instead.

Fields

- int<1> `0x04` : `COM_FIELD_LIST` header.

Response

- Zero or more result set rows.
- EOF packet.

This page is licensed: CC BY-SA / Gnu FDL

COM_INIT_DB

`COM_INIT_DB` is used to specify the default schema for the connection.

Fields

- int<1> `0x02` : `COM_INIT_DB` Header.
- string<NUL> schema name.

Response

ERR_Packet or OK_Packet.

Example

```
06 00 00 00 02 74 65 73 74 63                  .....testc
```

This page is licensed: CC BY-SA / Gnu FDL

COM_PING

`COM_PING` permits sending a packet containing one byte to check that the connection is active.

Fields

- int<1> `0x0e` : `COM_PING` header.

Response

OK_Packet.

This page is licensed: CC BY-SA / Gnu FDL

COM_PROCESSLIST

> **Note:**
>
> This command is deprecated and not used by MariaDB connectors any more. Use the SQL statement SHOW PROCESSLIST instead.

This page is licensed: CC BY-SA / Gnu FDL

COM_PROCESS_KILL

Forces the server to terminate a specified connection.

Fields

- int<1> `0xC` `COM_PROCESS_KILL`.
- int<4> process ID.

Response

OK Packet or ERR Packet.

This page is licensed: CC BY-SA / Gnu FDL

COM_QUERY

With the `COM_QUERY` command, the client sends the server an SQL statement to be executed immediately.

Fields

- int<1> `0x03` : `COM_QUERY` header.
- string<EOF> SQL statement.

The SQL statement should be properly escaped. The escape character is usually a backslash (`\`) = `0x5c` . However, if the status flag returned by the last OK Packet had the `NO_BACKSLASH_ESCAPES` bit set, the escape character is a single quote (`'` = `0x60`).

If the escape character is a backslash, the following characters are escaped:

- Single quote (`'` = `0x60`).
- Backslash (`\` = `0x5c`).
- Double quote (`"` = `0x22`).
- Null character (`0x00`).

If the escape character is a single quote, only the single quote (`'` = `0x60`) can be escaped.

Response

The server can answer with 4 different responses that can be differentiated by the first byte (packet header):

- `0xFF` - ERR_Packet if any error occurs.
- `0x00` - OK_Packet when query execution works without result set.
- `0xFB` - LOCAL_INFILE Packet if the query was `LOCAL INFILE ...` .
- Or a result set, when the query returns results (in case of a `SELECT` query, for example).

Example

1b 00 00 00 03 44 52 4f 50 20 54 41 42 4c 45 20	.....DROP TABLE
49 46 20 45 58 49 53 54 53 20 62 75 6c 6b 31	IF EXISTS bulk1

This page is licensed: CC BY-SA / Gnu FDL

COM_QUIT

Using the `COM_QUIT` command, the client tells the server that the connection should be terminated.

Fields

- int<1> `0x01` : `COM_QUIT` header.

Response

Server terminates connection.

This page is licensed: CC BY-SA / Gnu FDL

COM_RESET_CONNECTION

`COM_RESET_CONNECTION` resets a connection without reauthentication.

The command does this:

- Roll back any open transactions.
- Reset transaction isolation level.
- Rset session variables.
- Delete user variables.
- Remove temporary tables.
- Remove all `PREPARE` statements.

Database will *not* be reset to initial value.

Fields

- int<1> `0x1f` : `COM_RESET_CONNECTION` Header

Response

ERR_Packet or OK_Packet

This page is licensed: CC BY-SA / Gnu FDL

COM_SET_OPTION

Enables or disables server option.

Fields

- int<1> `0x1B` `COM_SET_OPTION` .
- int<2> option.

Options

Constant	Value
`MYSQL_OPTION_MULTI_STATEMENTS_ON`	0
`MYSQL_OPTION_MULTI_STATEMENTS_OFF`	1

Response

EOF Packet on success or ERR packet.

This page is licensed: CC BY-SA / Gnu FDL

COM_SHUTDOWN

Shuts down the server. To execute this command, the SHUTDOWN privilege is required.

Fields

- int<1> 0x0A COM_SHUTDOWN
- int<1> option

Options

Constant	Value
`SHUTDOWN_DEFAULT`	0

Response

OK Packet or ERR packet.

This page is licensed: CC BY-SA / Gnu FDL

COM_SLEEP

This command is used inside the server only.

Direction

Used inside server only.

Fields

- int<1> `0x00` : `COM_SLEEP` header.

Response

ERR_Packet.

This page is licensed: CC BY-SA / Gnu FDL

COM_STATISTICS

Get internal server statistics.

Fields

- int<1> `0x09` : `COM_STATISTICS` header.

Response

string<EOF> human-readable string.

This page is licensed: CC BY-SA / Gnu FDL

3 - Binary Protocol (Prepared Statements)

See COM_STMT_BULK_EXECUTE.

This command executes a bulk insert for a previously prepared statement, using a compact binary format for efficiency.

See COM_STMT_CLOSE.

This command deallocates a prepared statement on the server, freeing up associated resources.

See COM_STMT_EXECUTE.

This command executes a prepared statement using parameter values provided in the binary protocol format.

See COM_STMT_FETCH.

This command fetches rows from an existing result set of a prepared statement that was executed with a cursor.

See COM_STMT_PREPARE.

This command prepares an SQL statement on the server, returning a statement ID and metadata about parameters and columns.

See COM_STMT_RESET.

This command resets the data of a prepared statement on the server, clearing any buffers or previous parameter values.

See COM_STMT_SEND_LONG_DATA.

This command sends long data, such as BLOB or TEXT values, in chunks for a specific parameter of a prepared statement.

See Server Response Packets (Binary Protocol).

This section details the structure of response packets sent by the server when using the binary protocol, particularly for result sets.

This page is licensed: CC BY-SA / Gnu FDL

COM_STMT_BULK_EXECUTE

Executes a bulk insert of a previously prepared statement.

A command that returns a result set returns an error (Error packet).

Direction

Client to server.

Fields

- int<1> `0xfa` : `COM_STMT_BULK_EXECUTE` header.
- int<4> statement id.
- int<2> bulk flags.
- If (`bulk_flag` & `SEND_TYPES_TO_SERVER`):
  - For each parameter:
    - byte<1>: field type.
    - byte<1>: parameter type flag.
- Until end of packet:
  - For each parameter (i.e `param_count` times):
    - byte<1>: parameter indicator.
    - If indicator == `NONE` :
      - byte<n> : binary parameter value.

Flags

Bulk Flags

Flag	Value	Details
`SEND_UNIT_RESULTS`	64	Return generated affected rows and auto-increment IDs as a result set (only when server supports `MARIADB_CLIENT_BULK_UNIT_RESULTS` capability).
`SEND_TYPES_TO_SERVER`	128	Send types to server.

Parameter Type Flag

128	unsigned

Parameter Indicator

0	`NONE`	Value follow
1	`NULL`	Value is null
2	`DEFAULT`	For `INSERT` / `UPDATE`, value is default
3	`IGNORE`	Value is default for insert, Is ignored for update

Response

The server can answer with 3 different responses:

- `0xff`: ERR_Packet if any errors occur.
- `0x00`: OK_packet when query execution works without result set.
- A result set containing affected rows and auto-increment IDs when bulk flag `SEND_UNIT_RESULTS` is set.

This page is licensed: CC BY-SA / Gnu FDL

COM_STMT_CLOSE

Closes a previously prepared statement.

Direction

Client to server.

Implemented by

- mysql_stmt_close().
- mysql_stmt_prepare().

Fields

- int<1> `0x19` `COM_STMT_CLOSE` header.
- int<4> statement id.

Example

```
05 00 00 00 19 04 00 00 00
```

Response

No response from server.

This page is licensed: CC BY-SA / Gnu FDL

COM_STMT_EXECUTE

Executes a previously prepared statement.

If specific data is large, it can be sent separately prior to this command (see COM_STMT_SEND_LONG_DATA).

If a statement is re-executed without changing the bind types, the types do not need to be sent to the server again.

Direction

Client to server.

Fields

- int<1> `0x17` : `COM_STMT_EXECUTE` header.
- int<4> statement ID.
- int<1> flags.
- int<4> Iteration count (always 1).
- If (`param_count > 0`)
  - byte<(param_count + 7)/8> null bitmap.
  - byte<1>: send type to server (0 / 1).
  - If (send type to server):
    - For each parameter:
      - byte<1>: field type.
      - byte<1>: parameter flag.
  - For each parameter (for instance, `param_count` times):
    - If parameter is not null:
      - byte binary parameter value.

Statement ID

Statement ID is the identifier of the prepared statement (from COM_STMT_PREPARE answer).

Specific “-1” Statement ID Value

Value `-1` (`0xFFFFFFFF`) can be used to indicate to use the last statement prepared on current connection if no `COM_STMT_PREPARE` has failed since.

This permit pipelining :

- Send `COM_STMT_PREPARE` + `COM_STMT_EXECUTE` with statement ID `-1`.
- Read `COM_STMT_PREPARE` + `COM_STMT_EXECUTE` response.

In case `COM_STMT_PREPARE` returns an error, `COM_STMT_EXECUTE` returns an error that statement ID `-1` is unknown. This permits to avoid much of the network latency.

Flag

0	no cursor
1	read only
2	cursor for update
4	scrollable cursor

Cursors

If the flags of the `COM_STMT_EXECUTE` request a cursor to be opened, the returned result only contains the column definitions and the `EOF` that terminates it, and the result set rows are fetched using separate `COM_STMT_FETCH` commands.

Whether a cursor is actually opened is indicated by the `SERVER_STATUS_CURSOR_EXISTS` bit in the first EOF packet in the response to the `COM_STMT_EXECUTE`. If it is **not** set in, no cursor is opened and a normal result set is returned.

Parameter Flag

Parameter type flag byte:

128	**unsigned**

NULL-Bitmap

The `NULL-Bitmap` indicates if parameters are null (one bit per parameter). If the parameter is `NULL`, the bit is set in the bitmap and the parameter value is not sent.

The size in bytes of the `NULL-bitmap` can be calculated with: `(parameter number + 7) / 8`

Binary Parameter Encoding

The encoding of the `COM_STMT_EXECUTE` parameters are the same as the encoding of the binary result sets.

Response

The server can answer with 3 different responses:

- `0xff` : ERR_Packet if any errors occur.
- `0x00` : OK_packet when query execution works without result set.
- One (or more) result set, when query execution return rows (in case of `SELECT` query, for example).

This page is licensed: CC BY-SA / Gnu FDL

COM_STMT_FETCH

Fetch rows from a prepared statement.

A COM_STMT_EXECUTE with a non-zero cursor flag must have been successfully executed before any `COM_STMT_FETCH` commands can be executed.

Fields

- int<1> 0x1C COM_STMT_FETCH header.
- int<4> statement id.
- int<4> number of rows to fetch.

Response

Returns one or more binary result set rows followed by an EOF packet.

This page is licensed: CC BY-SA / Gnu FDL

COM_STMT_PREPARE

Prepares a statement on the server.

> **Note:**
>
> Not all statements can be prepared. See PREPARE for a list of statements that can be prepared.

Implemented by

- mariadb_stmt_execute_direct()
- mysql_stmt_prepare()

Fields

- int<1> `0x16` `COM_STMT_PREPARE` header
- string<EOF> SQL Statement

Example

```
1F 00 00 00 16 53 45 4C 45 43 54 20 2A 20 46 52  .....SELECT * FR
1F 4D 20 74 65 73 74 5F 62 69 6E 64 5F 72 65 73  OM test_bind_res
75 6C 74                                         ult
```

Response

If something goes wrong, the server sends an ERR_Packet. If the command succeeds, different packets are received:

- COM_STMT_PREPARE_OK.
- If number of parameters (count of `?` placeholders) > `0`:
  - For each parameter:
    - column definition packet.
  - If ! `DEPRECATE_EOF` eof_packet.
- If prepared statement returns result set and number of result set columns > `0`:
  - For each column:
    - column definition packet.
  - If ! `DEPRECATE_EOF` eof_packet.

COM_STMT_PREPARE_OK

- int<1> `0x00` `COM_STMT_PREPARE_OK` header.
- int<4> statement ID.
- int<2> number of columns in the returned result set (or 0 if statement does not return result set).
- int<2> number of prepared statement parameters (‘?’ placeholders).
- string<1> -not used-
- int<2> number of warnings.

This page is licensed: CC BY-SA / Gnu FDL

COM_STMT_RESET

Resets a prepared statement on the client and server to state after preparing.

Fields

- int<1> `0x1A` `COM_STMT_RESET` header.
- int<4> Statement ID.

Response

ERR_Packet or OK_Packet.

Example

```
05 00 00 00 1A 04 00 00 00
```

This page is licensed: CC BY-SA / Gnu FDL

COM_STMT_SEND_LONG_DATA

When data for a specific column is large, it can be sent separately to avoid the limitation of `max_allowed_packet` (see packet splitting).

Multiple `COM_STMT_SEND_LONG_DATA` commands with the same column ID append the data. `COM_STMT_SEND_LONG_DATA` is sent before COM_STMT_EXECUTE.

Fields

- int<1> `0x18` `COM_STMT_SEND_LONG_DATA` header.
- int<4> statement id.
- int<2> parameter number.
- byte<EOF> data.

Response

Server doesn't send response.

This page is licensed: CC BY-SA / Gnu FDL

Server Response Packets (Binary Protocol)

The following response packets will be sent from the server to client in binary protocol only. They may be mixed with packets from the text protocol, like OK_PACKET, `PACKET_METADATA` or ERR_PACKET.

See PACKET_BINDATA.

This page is licensed: CC BY-SA / Gnu FDL

PACKET_BINDATA

In contrast to the text protocol, the binary protocol transfers data according to the format of the field types returned in `PACKET_METADATA`.

Field type	Representation
MYSQL_TYPE_BIT	str_LEC
MYSQL_TYPE_BLOB	str_LEC
MYSQL_TYPE_DATE MYSQL_TYPE_DATETIME MYSQL_TYPE_TIMESTAMP	int_11 (default)int_7 (no microseconds)int_4 (no time values)int_0 (no values)
MYSQL_TYPE_DECIMAL	str_LEC
MYSQL_TYPE_DOUBLE	int_8
MYSQL_TYPE_ENUM	str_LEC
MYSQL_TYPE_FLOAT	int_4
MYSQL_TYPE_GEOMETRY	str_LEC
MYSQL_TYPE_INT24	int_4
MYSQL_TYPE_JSON	str_LEC
MYSQL_TYPE_LONGLONG	int_8
MYSQL_TYPE_LONG_BLOB	str_LEC
MYSQL_TYPE_LONG	int_4
MYSQL_TYPE_MEDIUM_BLOB	str_LEC
MYSQL_TYPE_NEWDECIMAL	str_LEC

Field type	Representation
MYSQL_TYPE_NULL	stored in bitmap
MYSQL_TYPE_SET	str_LEC
MYSQL_TYPE_STRING	str_LEC
MYSQL_TYPE_SHORT	int_2
MYSQL_TYPE_TINY_BLOB	str_LEC
MYSQL_TYPE_TINY	int_1
MYSQL_TYPE_VARCHAR	str_LEC
MYSQL_TYPE_VAR_STRING	str_LEC
MYSQL_TYPE_YEAR	int_4

Fields

```
(column_count + 7)/8   null bitmap
while (!eof) {
  for (i=0; i < column_count; i++)
  {
    data (length depends on the data type)
  }
}
```

This page is licensed: CC BY-SA / Gnu FDL

4 - Server Response Packets

For most commands which the client sends to the server, the server returns the following response packets:

See EOF_Packet.

Marks the end of a result set and returns status and warnings.

See ERR_Packet.

Indicates that an error occurred.

See LOCAL_INFILE_Packet.

If the client sends a `LOAD DATA LOCAL INFILE` statement via com_query, the server responds with `LOCAL_INFILE_Packet` to tell the client to send a specified file to the server.

See OK_Packet.

Sent by the server to the client. Indicates a successful completion of a command sent by the client before.

See Result Set Packets.

The server sends multiple packets as part of a result set.

See Result Set Row.

Data representing a database result set unit.

This page is licensed: CC BY-SA / Gnu FDL

EOF_Packet

The `EOF_Packet` marks the end of a result set, and returns status and warnings.

When testing for an EOF packet, the packet size must be less than 9 bytes in length. The result set can send data that begin with a `0xfe` byte, but then the packet length will be greater than 9.

Fields

- int<1> `0xfe` : EOF header.
- int<2> warning count.
- int<2> server status.

This page is licensed: CC BY-SA / Gnu FDL

ERR_Packet

`ERR_Packet` indicates that an error occurred.

Fields

- int<1> `ERR_Packet` header = `0xFF`.
- int<2> error code. see error list.
- If (error code == `0xFFFF`) /* progress reporting */:
  - int<1> stage.
  - int<1> max_stage.
  - int<3> progress.
  - string<lenenc> progress_info.
- Else:
  - If (next byte = '#'):
    - string<1> sql state marker '#'.
    - string<5> sql state.
    - string<EOF> human-readable error message.
  - Else:
    - string<EOF> human-readable error message.

> **Warning:**
>
> Note that the `ERR_Packet` is supposed to send a server error to the client. In particular, all error codes in the range 2000 to 2999 and 5000 to 5999 (inclusive) are reserved for client errors, and an ERR packet with such an error code will be considered malformed.

See also

- Progress reporting

This page is licensed: CC BY-SA / Gnu FDL

LOCAL_INFILE_Packet

If the client sends a `LOAD DATA LOCAL INFILE` statement via com_query, the server responds with `LOCAL_INFILE_Packet` to tell the client to send a specified file to the server.

Fields

- int<1> `0xFB` : `LOCAL_INFILE` header.
- string<EOF> filename.

Client Response

The client sends the file as the packet body. If the file is large, the contents are sent in multiple separate packets. After the file is sent, the client must send an empty packet to indicate that no more data will follow.

Once the client has finished sending the file, the server will respond with an OK_packet or an ERR_packet.

This page is licensed: CC BY-SA / Gnu FDL

OK_Packet

`OK_Packet` is sent by the server to the client and indicates a successful completion of a command sent by the client before.

Direction

Server to client.

Fields

- int<1> `0x00` : `OK_Packet` header or (`0xFE` if `CLIENT_DEPRECATE_EOF` is set).
- int<lenenc> affected rows.
- int last insert id.
- int<2> server status.
- int<2> warning count.
- If packet has more data:
  - string info.
  - If (status flags & `SERVER_SESSION_STATE_CHANGED`) and `session_tracking_supported` (see CLIENT_SESSION_TRACK):
    - string session state info.

The length-encoded info string is not always included in the packet. Check the length of the packet to detect if there is data after the warning count. For the first `OK_Packet` in the connection it contains (if present) the SSL certificate verification signature. For the following `OK_Packets` it contains (if present) various human-readable information.

Server status flag

Values of server status flags:

Flag	Value	Details
SERVER_STATUS_IN_TRANS	1	A transaction is currently active.
SERVER_STATUS_AUTOCOMMIT	2	Autocommit mode is set.
SERVER_MORE_RESULTS_EXISTS	8	More results exists (more packets will follow).
SERVER_QUERY_NO_GOOD_INDEX_USED	16	Set if EXPLAIN would've shown Range checked for each record.
SERVER_QUERY_NO_INDEX_USED	32	The query did not use an index.
SERVER_STATUS_CURSOR_EXISTS	64	When using `COM_STMT_FETCH` , indicate that current cursor still has result.
SERVER_STATUS_LAST_ROW_SENT	128	When using `COM_STMT_FETCH` , indicate that current cursor has finished to send results.
SERVER_STATUS_DB_DROPPED	1<<8	Database has been dropped.
SERVER_STATUS_NO_BACKSLASH_ESCAPES	1<<9	Current escape mode is “no backslash escape”.

Flag	Value	Details
SERVER_STATUS_METADATA_CHANGED	1<<10	A DDL change did have an impact on an existing `PREPARE` (an automatic re-prepare has been executed).
SERVER_QUERY_WAS_SLOW	1<<11	The query was slower than long_query_time.
SERVER_PS_OUT_PARAMS	1<<12	This result set contains stored procedure output parameter.
SERVER_STATUS_IN_TRANS_READONLY	1<<13	Current transaction is a read-only transaction.
SERVER_SESSION_STATE_CHANGED	1<<14	Session state change. See session change type for more information.

Session state info

- While packet has remaining data:
  - int<1> session change type.
  - If (session-change-type != `SESSION_TRACK_STATE_CHANGE`):
    - int total length.
  - string session data change.

Session change type

Change Type	Flag
0	SESSION_TRACK_SYSTEM_VARIABLES
1	SESSION_TRACK_SCHEMA
2	SESSION_TRACK_STATE_CHANGE
3	SESSION_TRACK_GTIDS
4	SESSION_TRACK_TRANSACTION_CHARACTERISTICS
5	SESSION_TRACK_TRANSACTION_STATE

Session Data Change

Each type of data has its own kind of format:

SESSION_TRACK_SCHEMA

- string new current schema.

SESSION_TRACK_SYSTEM_VARIABLES

While there is remaining data:

- string variable data.

For each variable data:

- string variable name.
- string variable value.

Note:

Possible tracked variables list is tracked by session_track_system_variables special variable value description:

- redirect_url: format is `mariadb/mysql:[<user>[:<password>]@]<host>[:<port>]/[<db>[?<opt1>=<value1>[&<opt2>=<value2>]]]`. Possible options:
  - `ttl` : cache timeout in ms to remember redirection, in order to reconnect directly to new host. 0=no caching

SESSION_TRACK_STATE_CHANGE

Indicates if session state changes occurred. The value is represented as `1`.

- string `1` if session state tracking was enabled.

SESSION_TRACK_GTIDS

This tracker is not implemented by MariaDB.

SESSION_TRACK_TRANSACTION_CHARACTERISTICS

- string Transaction characteristics.

Transaction characteristics is the set of SQL statements that reproduce the type and state of the current transaction. It can consist of the following SQL statements:

```
SET TRANSACTION ISOLATION LEVEL READ UNCOMMITTED;
SET TRANSACTION ISOLATION LEVEL READ COMMITTED;
SET TRANSACTION ISOLATION LEVEL REPEATABLE READ;
SET TRANSACTION ISOLATION LEVEL SERIALIZABLE;
START TRANSACTION;
START TRANSACTION WITH CONSISTENT SNAPSHOT;
START TRANSACTION WITH CONSISTENT SNAPSHOT, READ ONLY;
START TRANSACTION WITH CONSISTENT SNAPSHOT, READ WRITE;
SET TRANSACTION READ ONLY;
SET TRANSACTION READ WRITE;
XA START <XA specification>;
```

SESSION_TRACK_TRANSACTION_STATE

- string Transaction state string.

The transaction state string is always 8 characters long. The characters, in order, are:

1. No transaction: `_` Explicit transaction: `T` Implicit transaction: `I`
2. Transaction read safe: `_` Transaction read unsafe: `r`
3. Unknown transaction type: `_` Read-only transaction: `R`
4. Transaction write safe: `_` Transaction write unsafe: `w`
5. Unknown transaction type: `_` Read-write transaction: `W`
6. Transaction statement safe: `_` Transaction statement unsafe: `s`
7. Transaction does not have resultsets: `_` Transaction with result sets: `S`
8. No locked tables: `_` Tables have been locked: `L`

Notes

- To determine if session tracking is enabled, check if the CLIENT_SESSION_TRACK flag is set in `server_capabilities`.

This page is licensed: CC BY-SA / Gnu FDL

Result Set Packets

MariaDB Server sends the following packets as part of a result set.

A result set consists of different packets:

- Result set metadata.
  - 1 column count packet.
- If not (`MARIADB_CLIENT_CACHE_METADATA` capability set) `OR` (send metadata == 1):
  - For each column (for instance, `column_count` times):
    - Column Definition packet.
- If not (`CLIENT_DEPRECATE_EOF` capability set) EOF_Packet.
- n result set row.
- If error:
  - ERR_Packet.
- Else:
  - If `CLIENT_DEPRECATE_EOF` capability:
    - OK_Packet with a `0xFE` header.
  - Else EOF_Packet.

> **Warning:**
>
> It is unsafe to assume that any packet with a `0xFE` header is an OK packet (OK_Packet) or an EOF packet (EOF_Packet), because result set row packets (ResultsetRow) can also begin with `0xFE` when using the text protocol with a field length greater than `0xFFFFFF`.
> To safely confirm that a packet with a `0xFE` header is an OK packet (OK_Packet) or an EOF packet (EOF_Packet), you must also check that the packet length is less than `0xFFFFFF`.

Column Count Packet

The column count packet describes the number of columns in the result set. It uses the following format:

- int<lenenc> column count.
- If (`MARIADB_CLIENT_CACHE_METADATA` capability set):
  - int<1> metadata follows (0 / 1).

The metadata indicator byte is only present if both the client and the server declare the `MARIADB_CLIENT_CACHE_METADATA` capability.

If the metadata byte is set to `1`, the normal metadata follows the column definitions. If the metadata byte is set to `0`, the Column Count Packet is immediately followed by the second EOF packet (EOF_Packet) or the result set rows if the `CLIENT_DEPRECATE_EOF` capability is set.

Column Definition Packet

A column definition packet describes a column in the result set. It uses the following format:

- string<lenenc> catalog (always 'def').
- string<lenenc> schema.
- string<lenenc> table alias.
- string<lenenc> table.
- string<lenenc> column alias.
- string<lenenc> column.
- If extended type supported (see `MARIADB_CLIENT_EXTENDED_METADATA`):

    - string<lenenc> extended metadata.
- int<lenenc> length of fixed fields (=0xC).
- int<2> character set number.
- int<4> max. column size.
- int<1> Field types.
- int<2> Field detail flag.
- int<1> decimals.
- int<2> - unused -

Field Types

The column type field in the column definition packet describes the base type of the column. It also indicates how the values are encoded for `COM_STMT_EXECUTE` parameters and binary result set rows.

Value	Protocol Column Type	Encoding
0	MYSQL_TYPE_DECIMAL	byte encoding
1	MYSQL_TYPE_TINY	TINYINT Binary encoding
2	MYSQL_TYPE_SHORT	SMALLINT Binary encoding
3	MYSQL_TYPE_LONG	INTEGER Binary encoding
4	MYSQL_TYPE_FLOAT	FLOAT Binary encoding
5	MYSQL_TYPE_DOUBLE	DOUBLE Binary encoding
6	MYSQL_TYPE_NULL	Not used, being NULL is indicated by the NULL-bitmap in the result
7	MYSQL_TYPE_TIMESTAMP	TIMESTAMP Binary encoding
8	MYSQL_TYPE_LONGLONG	BIGINT Binary encoding
9	MYSQL_TYPE_INT24	INTEGER Binary encoding
10	MYSQL_TYPE_DATE	TIMESTAMP Binary encoding
11	MYSQL_TYPE_TIME	TIME Binary encoding
12	MYSQL_TYPE_DATETIME	TIMESTAMP Binary encoding
13	MYSQL_TYPE_YEAR	SMALLINT Binary encoding
14	MYSQL_TYPE_NEWDATE	byte encoding
15	MYSQL_TYPE_VARCHAR	byte encoding
16	MYSQL_TYPE_BIT	byte encoding
17	MYSQL_TYPE_TIMESTAMP2	Used only in the replication protocol
18	MYSQL_TYPE_DATETIME2	Used only in the replication protocol
19	MYSQL_TYPE_TIME2	Used only in the replication protocol
245	MYSQL_TYPE_JSON	byte encoding (only used with MySQL, MariaDB uses MYSQL_TYPE_STRING for JSON)
246	MYSQL_TYPE_NEWDECIMAL	byte encoding
247	MYSQL_TYPE_ENUM	byte encoding
248	MYSQL_TYPE_SET	byte encoding
249	MYSQL_TYPE_TINY_BLOB	byte encoding
250	MYSQL_TYPE_MEDIUM_BLOB	byte encoding
251	MYSQL_TYPE_LONG_BLOB	byte encoding
252	MYSQL_TYPE_BLOB	byte encoding

Value	Protocol Column Type	Encoding
253	MYSQL_TYPE_VAR_STRING	byte encoding
254	MYSQL_TYPE_STRING	byte encoding
255	MYSQL_TYPE_GEOMETRY	byte encoding

Field Details Flag

The column details flag describes certain column attributes and whether certain column options are set.

It is a bitmask with the following flags:

Flag Value	Flag Name	Flag Description
1	NOT_NULL	field cannot be null
2	PRIMARY_KEY	field is a primary key
4	UNIQUE_KEY	field is unique
8	MULTIPLE_KEY	field is in a multiple key
16	BLOB	is this field a Blob
32	UNSIGNED	is this field unsigned
64	ZEROFILL_FLAG	is this field a zerofill
128	BINARY_COLLATION	whether this field has a binary collation
256	ENUM	Field is an enumeration
512	AUTO_INCREMENT	field auto-increment
1024	TIMESTAMP	field is a timestamp value
2048	SET	field is a SET
4096	NO_DEFAULT_VALUE_FLAG	field doesn't have default value
8192	ON_UPDATE_NOW_FLAG	field is set to NOW on UPDATE
32768	NUM_FLAG	field is num

> **Note:**
>
> The `BLOB` flag cannot be used to determine if a column has binary data, because BINARY and VARBINARY columns are treated as strings, instead of blobs.
>
> The `BINARY_COLLATION` flag can be used to determine if a string column has binary data.

Extended Metadata

This extended column type information can be used to find out more specific details about the column type:

- For a POINT column, the column type field is `MYSQL_TYPE_GEOMETRY`, but the extended type indicates 'point'.
- For a JSON column, the column type field is `MYSQL_TYPE_STRING`, but the extended type indicates 'json'.
- For an XML (`XMLTYPE`) column, the column type field is `MYSQL_TYPE_LONG_BLOB`, but the extended type indicates 'xml'. This was added in MariaDB 12.3.2.
- While string has data:
  - int<1> data type: 0x00:type, 0x01: format.
  - string<lenenc> value.

This page is licensed: CC BY-SA / Gnu FDL

Result Set Row

A result set row represents a database result set unit, which is usually generated by executing a statement that queries the database. Using COM_STMT_EXECUTE, the result set row is in binary format, otherswise in text format.

Text Result Set Row

- For each column:
  - string<lenenc> column data.

The byte representation of the string according to client character collation.

Binary Result Set Row

- byte<1> `0x00` header.
- byte<(number_of_columns + 7) / 8> NULL-Bitmap.
- For each column:
  - If column value is not null:
    - If `MYSQL_TYPE_DOUBLE` type : DOUBLE Binary encoding
    - If `MYSQL_TYPE_LONGLONG` type : BIGINT Binary encoding
    - If `MYSQL_TYPE_INTEGER` type : INTEGER Binary encoding
    - If `MYSQL_TYPE_MEDIUMINT` type : MEDIUMINT Binary encoding
    - If `MYSQL_TYPE_FLOAT` type : FLOAT Binary encoding
    - If `MYSQL_TYPE_SMALLINT` type : SMALLINTBinary encoding
    - If `MYSQL_TYPE_YEAR` type : YEAR Binary encoding
    - If `MYSQL_TYPE_TINYINT` type : TINYINT Binary encoding
    - If `MYSQL_TYPE_DATE` type : DATE Binary encoding
    - If `MYSQL_TYPE_TIMESTAMP` type : TIMESTAMP Binary encoding
    - If `MYSQL_TYPE_DATETIME` type : TIMESTAMP Binary encoding
    - If `MYSQL_TYPE_TIME` type : TIME Binary encoding
    - If `MYSQL_TYPE_NEWDECIMAL` type : DECIMAL Binary encoding
    - If `MYSQL_TYPE_TINY_BLOB`, `MYSQL_TYPE_MEDIUM_BLOB`, `MYSQL_TYPE_LONG_BLOB`, `MYSQL_TYPE_BLOB`, `MYSQL_TYPE_GEOMETRY`, `MYSQL_TYPE_STRING`, `MYSQL_TYPE_VARCHAR`, `MYSQL_TYPE_VAR_STRING`): byte<lenenc> value

NULL-Bitmap Values

The `NULL`-Bitmap indicates if a parameter for a column is null (one bit per parameter) beginning with the 3rd bit. `NULL`-bitmap size is (number_of_columns + 7) / 8.

DECIMAL Binary Encoding

`DECIMAL` has no fixed size, so will be encoded as string<lenenc>. A `DECIMAL(10,2)` with a value of `-15.5` is stored as:

```
06 45 49 53 46 53 48      . - 1 5 . 5 0
```

DOUBLE Binary Encoding

`DOUBLE` is the IEEE 754 floating-point value in Little-endian format on 8 bytes.

BIGINT Binary Encoding

`BIGINT` is the value in Little-endian format on 8 bytes. Signed is defined by the Column field detail flag.

INTEGER Binary Encoding

`INTEGER` is the value in Little-endian format on 4 bytes. Signed is defined by the Column field detail flag.

MEDIUMINT Binary Encoding

`MEDIUMINT` is similar to `INTEGER` binary encoding, even if `MEDIUM` int is 3-bytes encoded server side. (Last byte will always be 0x00).

FLOAT Binary Encoding

`FLOAT` is the IEEE 754 floating-point value in Little-endian format on 4 bytes.

SMALLINT Binary Encoding

`SMALLINT` is the value in Little-endian format on 2 bytes. Signed is defined by the Column field detail flag.

YEAR Binary Encoding

`YEAR` uses the same format as `SMALLINT`.

TINYINT Binary Encoding

`TINYINT` is the value of 1 byte. Signed is defined by the Column field detail flag.

DATE Binary Encoding

`DATE` uses the same format as `TIMESTAMP` binary encoding, with a data length of `0` for the special '`0000-00-00`' value and `4` for the standard year/month/day format.

TIMESTAMP Binary Encoding

Data is encoded in 8 bytes without fractional seconds, 12 bytes with fractional seconds.

Byte Position	Description
1	data length : 0 for special '0000-00-00 00:00:00' value. 4 with year + month + day of month only 7 for timestamps without fractional seconds 11 with fractional seconds
2-3	year on 2 bytes little-endian format
4	Month (1=january)
5	days of month
6	hour of day (0 if DATE type)
7	minutes (0 if DATE type)
8	seconds (0 if DATE type)
9-12	micro-second on 4 bytes little-endian format (only if data-length is > 7)

TIME Binary Encoding

Data is encoded in 9 bytes without fractional seconds, 13 bytes with fractional seconds.

- int<1> data length: 0 for special '00:00:00' value, 8 without fractional seconds, 12 with fractional seconds.
- If data length > `0`:
  - int<1> `0` for positive time, `1` for negative time.

- int<4> days.
- int<1> hours.
- int<1> minutes.
- int<1> seconds.
- if data length > `8` :
  - int<4> microseconds.

This page is licensed: CC BY-SA / Gnu FDL

Replication Protocol

See 1-Binlog Events.

This section provides an overview of the various events recorded in the binary log, which are the core units of replication data transmission.

See 2-Binlog Event Header.

Every binary log event starts with a standardized header containing metadata such as the timestamp, event type, server ID, and event size.

See 3-Binlog Network Stream.

Describes the continuous packet stream format used to transmit binary log events from the primary server to the replica over the network.

See 4-Semi-Sync Replication.

Explains the handshake and acknowledgement process for semi-synchronous replication, ensuring data is committed on at least one replica.

See 5-Replica Registration.

Details the initialization phase where a replica connects to the primary, authenticates, sends capabilities, and registers for updates.

See ANNOTATE_ROWS_EVENT.

This event accompanies row-based events to provide the original SQL query text, which is useful for auditing and debugging replication.

See BEGIN_LOAD_QUERY_EVENT.

Used during LOAD DATA INFILE operations, this event marks the beginning of the data load and contains the initial query information.

See BINLOG_CHECKPOINT_EVENT.

A marker event indicating a checkpoint in the binary log, used to ensure consistency and safe rotation of log files.

See COM_BINLOG_DUMP.

This command is sent by a replica to the primary server to request the start of the binary log event stream from a specific file and position.

See COM_REGISTER_SLAVE.

This command is used by a replica to register its details, such as server ID, hostname, and port, with the primary server.

See EXECUTE_LOAD_QUERY_EVENT.

This event is used for LOAD DATA INFILE operations, managing the execution phase similar to a QUERY_EVENT but with extra static fields for file handling.

See Fake GTID_LIST Event.

A synthetic event sent by the master after the initial handshake to inform the replica of its current GTID state, it is not written to the binary log.

See Fake ROTATE_EVENT.

An artificial event sent to the replica to indicate the name of the binary log file on the master, ensuring the replica knows which file is being read.

See FORMAT_DESCRIPTION_EVENT.

This descriptor event appears at the start of every binary log file, defining the server version, binlog version, and header lengths for all event types.

See GTID_EVENT.

The GTID_EVENT marks the start of a new transaction event group, associating it with a Global Transaction ID (GTID) and providing commit flags.

See GTID_LIST_EVENT.

Logged during binlog rotation or checkpoints, this event lists the GTIDs present in the binary log to help replicas determine their replication state.

See HEARTBEAT_LOG_EVENT.

A heartbeat event sent over the network by the master when there are no binlog events, ensuring the replica knows the connection is still active.

See INTVAR_EVENT.

This event records integer values for auto-increment columns or the LAST_INSERT_ID function, ensuring that these values are replicated deterministically.

See QUERY_EVENT.

The QUERY_EVENT records text-based SQL statements for statement-based replication, capturing the query string and execution context like the default database.

See RAND_EVENT.

The RAND_EVENT records the two seed values used for the random number generator, ensuring that calls to the RAND() function produce identical results on replicas.

See ROTATE_EVENT.

The ROTATE_EVENT indicates a log rotation, specifying the name of the next binary log file and the position where writing will continue.

See ROWS_EVENT_V1/V2, ROWS_COMPRESSED_EVENT_V1.

These events record row-level changes (WRITE, UPDATE, DELETE) for replication, with versions supporting different column counts and compression.

See START_ENCRYPTION_EVENT.

This event marks the beginning of encrypted data in the binary log, defining the encryption scheme and key version for subsequent events.

See STOP_EVENT.

The STOP_EVENT is written to the binary log when the server shuts down, serving as a marker for a clean stop.

See TABLE_MAP_EVENT.

This event provides a mapping between a table ID and its table definition, preceding row events to interpret the row data correctly.

See USER_VAR_EVENT.

The USER_VAR_EVENT logs the value of a user-defined variable, ensuring that statements using variables replicate consistently.

See XA_PREPARE_LOG_EVENT.

This event records the preparation phase of an XA transaction, storing the XID to support two-phase commit and recovery.

See XID_EVENT.

The XID_EVENT signifies the commit of a transaction, containing the transaction ID (XID) to ensure atomicity across replication.

This page is licensed: CC BY-SA / Gnu FDL

1-Binlog Events

Binary log events, or binlog events, are information about data modification made to a MariaDB server instance stored in the binary log files.

Log File Structure

Each log file contains:

- A 4-byte magic number, followed by a series of events describing data modifications:
  The magic number bytes are `0xfe` `0x62` `0x69` `0x6e` = `0xfe 'b''i''n'` (this is the `BINLOG_MAGIC` constant).
- A series of binlog events.

Event Content

Each event contains the 'header' followed by 'data bytes':

The header bytes provide information about:

- The event type;
- The creation time;
- Which server created the event;
- Flags and so forth.

The data bytes provide information specific to the type of event.

> **Note:**
>
> The first event, FORMAT_DESCRIPTION_EVENT at 'position' 4, is a descriptor event that describes the format used to write events in the file.

The remaining events are interpreted according to the version.

The final event is usually a log-rotation event ROTATE_EVENT that specifies the next binary log filename or a STOP_EVENT written during server shutdown.

Note: in case of a server crash there is no terminating event (no `ROTATE` nor `STOP`).

Example Binlog File (Hexdump -C $file_name)

```
fe 62 69 6e a4 85 9e 59  0f 8c 27 00 00 f5 00 00  |.bin...Y..'.....|
00 f9 00 00 00 00 00 04  00 31 30 2e 31 2e 32 34  |.........10.1.24|
2d 4d 61 72 69 61 44 42  00 6c 6f 67 00 00 00 00  |-MariaDB.log....|
00 00 00 00 00 00 00 00  00 00 00 00 00 00 00 00  |................|

2-Binlog Event Header

All the binlog events stored in a binary log file have a common structure:

- An event header;
- Event data.

Event Header Structure, 19 Bytes

- uint<4> Timestamp (creation time).
- uint<1> Event Type (type_code).
- uint<4> Server_id (server which created the event).
- uint<4> Event Length (header + data).
- uint<4> Next Event position.
- uint<2> Event flags.

> **Note:**
>
> **Note**: if `CRC32` is in use, the Event Length is 4 bytes bigger in size. The 4 bytes `CRC32` are written at the end of the event (just after the last 'data' byte).

Encrypted Binlog Events

For encrypted binlog events, only the event length is in plaintext, and everything else is encrypted.

To decrypt the binlog event:

- Store the event length in memory;
- Move the timestamp into the event length position;
- Decrypt the whole payload except the first four bytes;
- Move the timestamp back to its original position;
- Copy the original event length back to its position.

Regardless of the cipher used to encrypt the binlogs, the encrypted data are the same size as the original unencrypted event. For events that are encrypted in CBC mode, and whose length is not a multiple of the cipher block size, the final partial block is encrypted using a form of residual block termination:

- Encrypt the current IV of the binlog file in ECB mode;
- `XOR` the remaining bytes with the encrypted IV.

Event Type

Hex	Event type description
0x02	QUERY_EVENT
0x03	STOP_EVENT
0x04	ROTATE_EVENT
0x10	XID_EVENT
0x0d	RAND_EVENT
0x0e	USER_VAR_EVENT
0x0f	FORMAT_DESCRIPTION_EVENT
0x13	TABLE_MAP_EVENT
0x1b	HEARTBEAT_LOG_EVENT
0xa0	ANNOTATE_ROWS_EVENT
0xa1	BINLOG_CHECKPOINT_EVENT
0xa2	GTID_EVENT
0xa3	GTID_LIST_EVENT
0xa4	START_ENCRYPTION_EVENT
0xa5	QUERY_COMPRESSED_EVENT
0xa6	WRITE_ROWS_COMPRESSED_V1
0xa7	UPDATE_ROWS_COMPRESSED_V1
0xa8	DELETE_ROWS_COMPRESSED_V1
0xa9	WRITE_ROWS_V1
0xaa	UPDATE_ROWS_V1
0xab	DELETE_ROWS_V1

Fake Events

These are generated on the fly, never written:

Hex	Event type description
0x04	FAKE_ROTATE_EVENT
0xa3	FAKE_GTID_LIST_EVENT

Event Flag

Hex	Event flag description
0x0001	`LOG_EVENT_BINLOG_IN_USE_F` This flag only makes sense for `Format_description_log_event`. It is set when the event is written, and *reset* when a binlog file is closed (yes, it's the only case when MySQL modifies already written part of binlog). Thus it is a reliable indicator that binlog was closed correctly.
0x0002	`LOG_EVENT_FORCED_ROTATE_F` (unused).
0x0004	`LOG_EVENT_THREAD_SPECIFIC_F` If the query depends on the thread (for example: `TEMPORARY TABLE`).
0x0008	`LOG_EVENT_SUPPRESS_USE_F` Suppress the generation of 'USE' statements before the actual statement. This flag should be set for any events that does not need the current database set to function correctly. Most notable cases are '`CREATE DATABASE`' and '`DROP DATABASE`'.
0x0010	`LOG_EVENT_UPDATE_TABLE_MAP_VERSION_F` (unused).
0x0020	`LOG_EVENT_ARTIFICIAL_F` Artificial events are created arbitrarily and not written to binary log.These events should not update the master log position when slave SQL thread executes them.
0x0040	`LOG_EVENT_RELAY_LOG_F` Events with this flag set are created by slave IO thread and written to relay log.
0x0080	`LOG_EVENT_IGNORABLE_F` For an event, 'e', carrying a type code, that a slave,'s', does not recognize, 's' will check 'e' for `LOG_EVENT_IGNORABLE_F`, and if the flag is set, then 'e'is ignored. Otherwise, 's' acknowledges that it has found an unknown event in the relay log.
0x0100	`LOG_EVENT_NO_FILTER_F` (no description yet).
0x0200	`LOG_EVENT_MTS_ISOLATE_F` (no description yet).
0x8000	`LOG_EVENT_SKIP_REPLICATION_F` Flag set by application creating the event (with `@@skip_replication`);the replica skips replication of such events, if `--replicate-events-marked-for-skip` is not set to `REPLICATE`. This is a MariaDB flag; we allocate it from the end of the available values to reduce risk of conflict with new MySQL flags.

Event Header Example of FORMAT_DESCRIPTION_EVENT

This is the first event in the binlog file at pos 4:

```
a4 85 9e 59 0f 8c 27 00  00 f5 00 00 00 f9 00 00  ...Y..'.........
00 00 00 04 00 31 30 2e  31 2e 32 34 2d 4d 61 72  .....10.1.24-Mar
69 61 44 42 00 6c 6f 67  00 00 00 00 00 00 00 00  iaDB.log....
...
...
```

Interpretation of First 19 Bytes of the Event (the Event Header)

- a4 85 9e 59 [4] Timestamp => 59 9e 85 a4 => 1503561124 = 2017-08-24 09:52:04
- 0f [1] Event Type = 0x0f = FORMAT_DESCRIPTION_EVENT
- 8c 27 00 00 [4] Server_id => 00 00 27 8c = 10124
- f5 00 00 00 [4] Event length => 00 00 00 f5 => 245
- f9 00 00 00 [4] Next Event pos => 00 00 00 f9 => 249 (pos 4 + event size)

- 00 00 [2] Event flags = 0

This page is licensed: CC BY-SA / Gnu FDL

3-Binlog Network Stream

The binary log events stored in a binary log file can be sent over the network in order to replicate data changes from the master server (where data changes are written in binary logs) to replica servers which apply data changes to their own databases.

The MariaDB replica replication protocol consists of:

- A registration phase to master;
- Events receiving (the master sending data when changes are available).

> **Note:**
>
> This section is related to **events sending only**.

Binlog Network streams are requested with `COM_BINLOG_DUMP` , and each Binlog Event is prepended with a status byte. The data sent over network is then MariaDB network protocol (4 bytes) + 1 byte status flag + event data.

MariaDB network protocol 4 bytes are:

- uint<3> packet length (the sent binlog event can be up to 2^24 - 1 - 1 data bytes).
- uint<1> packet sequence byte<1>(0 to 255).

Replication protocol status byte:

- uint<1> OK (0) or ERR (ff) or End of File, EOF, (fe).

> **Warning:**
>
> Due to the 1 byte status flag, the effective data payload is event_size + 1. This means than an event of exactly 16M bytes (2 ^ 24 - 1) cannot be sent in one transmission: it requires 2 packets instead.

```
packet #n:   3 bytes length + sequence + status + [event_header + (event data - 1)]
packet #n+1: 3 bytes length + sequence + last byte of the event data.
```

> **Note:**
>
> The remaining bytes of a large event transmission are always sent **without** a status flag and binlog event header, but rather just as network packet header + data.

Example of an Event Transmission HEARTBEAT_LOG_EVENT

```
T 127.0.0.1:8808 -> 127.0.0.1:57157 [AP]
  23 00 00 04 00 00 00 00    00 1b 67 2b 00 00 22 00    '.........g+..&.
  00 00 ed 01 00 00 20 00    66 6f 6f 2d 62 69 6e 2e    ...... .log-bin.
  31 30 30 30 31 33 39                                  1000139
```

Network Replication Protocol, 5 Bytes

- packet size [3] = 23 00 00 => 00 00 23 => 35 (ok byte + event size).
- pkt sequence [1] = 04.
- `OK` indicator [1] = 0 (`OK`).

Heartbeat event

- Header, 19 bytes.
- Content, string<EOF>.

This page is licensed: CC BY-SA / Gnu FDL

4-Semi-Sync Replication

Regular MariaDB replication is asynchronous. MariaDB also includes semisynchronous replication semi-synchronous Binlog Event.

Event Header Changes

If the user variable `@rpl_semi_sync_slave` is set, 2 extra bytes are added after the status byte of a binlog network stream and before the normal binlog event header.

- uint<1> semi-sync indicator, always `0xef`.
- uint<1> semi-sync flags, either `0x00` (no `ACK`) or `0x01` (`ACK`).

Note : The packet size, as in the network protocol header, is then: `event_size + 1 byte status + 2 bytes semi-sync replication`.

The MariaDB server sets the user variable whenever it is starting replication. For MariaDB Connector/C , the following query must be executed before the call to `mariadb_rpl_open()` is made to enable semi-sync replication.

```
SET @rpl_semi_sync_slave=1
```

If the semi-sync flag is set to `0x01`, the master waits for a Semi Sync `ACK` packet from the slave and when the Semi Sync `ACK` is seen, the master acknowledges the client which has issued the transaction with a standard `OK_Packet` or a `ERR_Packet`.

The master can then write the transaction to the binary log and send the next events to the replica.

Note : The master only requests Semi Sync ACKs if rpl_semi_sync_master_enabled is enabled. If it is not enabled, the semi-sync flag will always be `0x00`.

Semi Sync ACK Details

This event is sent by the replica **only if** the semi-sync flag is set to `0x01`.

- uint<1> semi-sync indicator, always 0xef;
- uint<8> the next position of received event;
- string<EOF> binlog file name.

> **Note:**
>
> This packet sent by the replica never includes the `CRC32`.

Sending an `ACK` when the semi-sync flag is set to `0x0` causes an error, and the connection is closed.

Example of Heartbeat Event With Semi-Sync Protocol and CRC32

We can see:

- 2a 00 00 [3 bytes] packet size.
- 06 [1] sequence.
- 00 [1] status byte = 00 => OK.
- ef 00 [2] bytes => semi sync indicator (0xef) and semi-sync flag (00).

- The ef 00 2 bytes after the OK byte 00.

```
T 127.0.0.1:23240 -> 127.0.0.1:41054 [AP]
  2a 00 00 06 00 ef 00 00    00 00 00 1b d9 27 00 00    *............'..
  27 00 00 00 79 04 00 00    00 00 6d 79 73 71 6c 2d    '...y.....mysql-
  62 69 6e 2e 30 30 30 30    33 34 ed ef e1 f0          bin.000034....
```

Example of XID_EVENT, With CRC32

The master sets the Semi-Sync `ACK` request in the `XID_EVENT` event:

We see the 2 semi sync bytes: **ef** and **01**. The latter, being 1, means the replica server must send the Semi Sync `ACK` packet.

We also see in the binlog event header:

- Event Type [1] = 10 `XID_EVENT`.
- Next Event pos [4] = 4a 05 00 00 => 1354.

```
22 00 00 0c 00 ef 01 17  d0 37 5a 17 d0 37 5a 10  ".........7Z.
d9 27 00 00 1f 00 00 00  4a 05 00 00 00 00 6f 00  .?......J.....o.
00 00 00 00 00 00 44 30  aa fc                    ......D0..
```

Example of Semi-Sync ACK

This is sent by the replica server after the `XID_EVENT` receiving.

We see:

- The semi sync indicator [1] = 0xef, sent before anything else.
- The Next Event position [8] = 4a 05 00 00 00 00 00 00 => 1354 which is the next position of the XID_EVENT above.
- The binlog filename = mysql-bin.000034.

Please note:

- There is no terminating `CRC32`.
- The packet sequence now start starts from 0.

```
19 00 00 00 ef 4a 05 00    00 00 00 00 00 6d 79 73    .....J.......mys
  71 6c 2d 62 69 6e 2e 30    30 30 30 33 34             ql-bin.000034
```

This page is licensed: CC BY-SA / Gnu FDL

5-Replica Registration

Overview

The replica server, when properly configured with `CHANGE MASTER TO ...` , can start MariaDB replication with the START REPLICA statement.

After authentication, some COM_QUERY packets are exchanged before sending COM_REGISTER_SLAVE and COM_BINLOG_DUMP.

The following `COM_QUERY` packets come from MariaDB 10.X replicas using GTID:

- `SELECT UNIX_TIMESTAMP()`;
- `SHOW VARIABLES LIKE 'SERVER_ID'`;
- `SET @master_heartbeat_period` = 30000001024;

- `SET @master_binlog_checksum= @@global.binlog_checksum;`
- `SELECT @master_binlog_checksum;`
- `SET @mariadb_slave_capability=4;`
- `SELECT @@GLOBAL.gtid_domain_id GTID` registration: domain ID;
- `SET @slave_connect_state='0-10201-9868'` GTID registration: the requested GTID;
- `SET @slave_gtid_strict_mode=0` GTID registration: strict_mode;
- `SET @slave_gtid_ignore_duplicates=0` GTID registration: ignore_duplicates.

Then `COM_REGISTER_SLAVE` completes the registration.

The `COM_BINLOG_DUMP` marks the request of binlog events stream.

> **Note:**
>
> If semi-sync is in use, the request for the network protocol change is sent between `COM_REGISTER_SLAVE` and `COM_BINLOG_DUMP`.

Example Using 'ngrep'

COM_REGISTER_SLAVE, Semi-Sync and COM_BINLOG_DUMP:

```
T 127.0.0.1:42158 -> 127.0.0.1:23240 [AP]

T 127.0.0.1:42158 -> 127.0.0.1:23240 [AP]
  1c 00 00 00 03 53 45 54    20 40 72 70 6c 5f 73 65    .....SET @rpl_se
  6d 69 5f 73 79 6e 63 5f    73 6c 61 76 65 3d 20 31    mi_sync_slave= 1

T 127.0.0.1:23240 -> 127.0.0.1:42158 [AP]
  07 00 00 01 00 00 00 02    00 00 00                   ...........

T 127.0.0.1:42158 -> 127.0.0.1:23240 [AP]
  1b 00 00 00 12 34 06 00    00 02 00 75 27 00 00 6d    .....4.....u'..m
  79 73 71 6c 2d 62 69 6e    2e 30 30 30 30 33 34       ysql-bin.000034
```

In the example, we see that these two `COM_QUERY` commands are sent just after `COM_REGISTER_SLAVE` and before `COM_BINLOG_DUMP`:

- `SHOW VARIABLES LIKE` 'rpl_semi_sync_master_enabled';
- `SET @rpl_semi_sync_slave` = 1.

Complete Example with GTID Registration

The example shows output up to `COM_BINLOG_DUMP` request, No Semi-Sync:

```
T 127.0.0.1:23240 -> 127.0.0.1:42367 [AP]

Events Transmission After COM_BINLOG_DUMP

The MariaDB master always sends this, after the `COM_BINLOG_DUMP`:

- FAKE_ROTATE_EVENT;
- FORMAT_DESCRIPTION_EVENT: Next Pos in the header is set to 0 if not requesting binlog file from the beginning, and the GTID is not in use; otherwise, Next Pos is related to next event after FDE.
- FAKE_GTID_LIST_EVENT with latest GTID information.

After those first events, the master sends events related to changes in database to the connected replica binlog. The replica is just waiting for new events from master.

Complete Example of Event Transmission With CRC32

```

ANNOTATE_ROWS_EVENT

`ANNOTATE_ROWS_EVENT` events accompany row events and describe the query which caused the row event.

You can enable this with –binlog-annotate-row-events (default on).

In the binary log, each `ANNOTATE_ROWS` event precedes the corresponding Table map event.

For additional information refer to the annotate_rows_log_event documentation.

> **Note:**
>
> The master server sends `ANNOTATE_ROWS_EVENT` events only if the replica server connects with the `BINLOG_SEND_ANNOTATE_ROWS_EVENT` flag (value is 2) in the `COM_BINLOG_DUMP` replica registration phase.

Header

- Event Type is 160 (`0xa0`).

Fields

- string<EOF> The SQL statement (not null-terminated).

Complete Example with CRC32

```
ee b7 15 5a a0 01 00 00  00 36 00 00 00 80 0b 00  ...Z.....6......
00 00 00 69 6e 73 65 72  74 20 69 6e 74 6f 20 74  ...insert into t
65 73 74 2e 74 34 20 76  61 6c 75 65 73 28 31 30  est.t4 values(10
30 29 6d 4c 42 33                                 0)mLB3
```

This page is licensed: CC BY-SA / Gnu FDL

BEGIN_LOAD_QUERY_EVENT

This event is written to the binary log file for LOAD DATA INFILE events if the server variable `binlog_mode` is set to "`STATEMENT`".

Header

- Event Type = 0x11.

Fields

Fixed data part:

- uint<4> The ID of the file.

Variable data part:

- byte<NULL> Null terminated data block.

Example

This page is licensed: CC BY-SA / Gnu FDL

BINLOG_CHECKPOINT_EVENT

Binlog Checkpoint Event, Event Type is 161 (0xa1). This event specifies a binlog file such that XA crash recovery can start from that file.

> **Note:**
>
> There can be more than one event in a binlog file.

Header

- Event type is 161 (0xa1).

Fields

- uint<4> Log filename length.
- string<EOF> Log filename.

Example Without CRC32

```
12 ad 26 5a a1 84 27 00  00 27 00 00 00 47 01 00  ..&Z..'..'...G..
00 00 00 10 00 00 00 6d  79 73 71 6c 2d 62 69 6e  .......mysql-bin
2e 30 30 30 30 36 32                              .000062
```

Header, 19 Bytes

- Event Timestamp = 12 ad 26 5a.
- Event Type = a1 => 161.
- Server_id = 84 27 00 00 => 00 00 27 84 = 10116.
- Event Size = 27 00 00 00 => 00 00 00 27 = 39.
- Next Pos = 47 01 00 00 => 00 00 01 47 = 327.
- Flags = 00 => 0.

Content, Variable Size

- Filename length = 10 00 00 00 = >00 00 00 10 => 16.
- Filename = mysql-bin.000062.

This page is licensed: CC BY-SA / Gnu FDL

COM_BINLOG_DUMP

This is a command the replica sends to the master after COM_REGISTER_SLAVE.

The master server sends the binlog events from the requested file and position, or if GTID registration is in use, from the GTID value set in the earlier registration phase.

The payload is:

- uint<1> command (COM_BINLOG_DUMP = 0x12).
- uint<4> The requested binlog position.
- uint<2> Flags.

- uint<4> Slave server_id.
- string<EOF> The requested binlog file name.

Note

- Flags, usually set to `0`. It can be set to `BINLOG_SEND_ANNOTATE_ROWS_EVENT` (`0x02`) if the replica server wants to receive the MariaDB 10 ANNOTATE_ROWS events.
  It can also be set to `BINLOG_DUMP_NON_BLOCK` (`1`), in the case the replica is receiving an EOF packet after the last event sent by the master.
- Requested binlog position can be `4` when registering to master server for the very first time or when requesting events from a particular binlog file from the beginning of it.
- The requested binlog file can empty when registering for the very first time if master log file is unknown or with GTID registration (not required).
- After sending events to the replica the server kills the connection.

When replication resumes or it is restarted (`STOP REPLICA`; `START REPLICA`), the replica server always sends the latest binlog file name and position, even if GTID registration is in place.

Example of COM_BINLOG_DUMP

```
1b 00 00 00 12 34 06 00    00 02 00 75 27 00 00 6d    .....4.....u'..m
  79 73 71 6c 2d 62 69 6e    2e 30 30 30 30 33 34       ysql-bin.000034
```

After 4 bytes network protocol header we can see:

- Command [1] = 12.
- Requested binlog position [4] = 34 06 00 00 => 00 00 06 34 = 1588.
- Flags [2] = 02 00 => 2 = `BINLOG_SEND_ANNOTATE_ROWS_EVENT`.
- Binlog file[n] = mysql-bin.000034.

This page is licensed: CC BY-SA / Gnu FDL

COM_REGISTER_SLAVE

This command is sent by the replica server to start MariaDB replication, and should be sent before requesting binlog events with COM_BINLOG_DUMP.

The payload is:

- uint<1> command (`COM_REGISTER_SLAVE` = `0x15`).
- uint<4> Replica server ID.
- uint<1> Replica hostname length.
- string<n> Hostname.
- uint<1> Replica username length.
- string<n> Username.
- uint<1> Replica password length.
- string<n> Replica password.
- uint<2> Replica connection port.
- uint<4> Replication rank.
- uint<4> Master server ID.

Note:

- Replica hostname, replica user, replica password, and replica port are usually not set. Some replica replication parameters can be used for such settings (`report_host` , `report_port` , and so forth).
- Replication rank is not set.
- Master server ID is not set either.

Example of COM_REGISTER_SLA

The replica server is configured with:

- server-id=10101;
- report-host=slave_n_1;
- report-port=23241.

```
1b 00 00 00 15 75 27 00    00 09 73 6c 61 76 65 5f    .....u'...slave_
 6e 5f 31 00 00 c9 5a 00    00 00 00 00 00 00 00       n_1...Z.......
```

We can see from the example:

- server_id [4] = 75 27 00 00 => 10101.
- hostname_len [1] = 09.
- hostname[n] = slave_n_1 (9 bytes).
- username len [1] = 0 (not set).
- password len [1] = 0 (not set).
- slave port [2] = c9 5a => 23241.
- rank [4] = 0.
- master server id = 0.

EXECUTE_LOAD_QUERY_EVENT

This event is written to the binary log file for LOAD DATA INFILE events. The event format is similar to a QUERY_EVENT, except that it has extra static fields.

Header

- Event Type = 0x12.

Fields

Fixed Data Part

- uint<4> The ID of the thread that issued this statement on the master.
- uint<4> The time in seconds that the statement took to execute.
- uint<1> The length of the name of the database which was the default database when the statement was executed. This name appears later, in the variable data part. It is necessary for statements such as `INSERT INTO t VALUES(1)` that don't specify the database and rely on the default database previously selected by `USE` .
- uint<2> The error code resulting from execution of the statement on the master.
- uint<2> The length of the status variable block.
- uint<4> The ID of the loaded file.
- uint<4> Offset from the start of the statement to the beginning of the filename.
- uint<4> Offset from the start of the statement to the end of the filename.
- uint<1> How `LOAD DATA INFILE` handles duplicates (0x0: error, 0x1: ignore, 0x2: replace).

Variable Data Part

- byte<n> Zero or more status variables. Each status variable consists of one byte code identifying the variable stored, followed by the value of the variable. The format of the value is variable-specific.
  The number of bytes 'n' is the length of the status variable block (read in fixed data part)
- string<NUL> The default database name (null-terminated).
- string<EOF> The SQL statement. By subtraction the size of the statement can be known.

This page is licensed: CC BY-SA / Gnu FDL

Fake GTID_LIST Event

This event is sent by master server to the registering replica. It is sent only once, after the Format Description Event.

> **Note:**
>
> The fake `GTID_LIST` event is not written in the binlog file. It's created by the master and sent to newly connected replica before any "real" binlog event.

Header

- Event type is set to `163` (`0xa3`).
- Time stamp set to `0`.
- NextPos tells which is the binlog position of next event.
- Flags are set to `ARTIFICIAL` (`0x20`).

Content

The content is the same as the "real" GTID_LIST.

- **of GTIDs**
- domain_id
- server_id
- sequence
- …

This page is licensed: CC BY-SA / Gnu FDL

Fake ROTATE_EVENT

When a slave server connects to a MariaDB master server, the first binlog event sent is Fake `ROTATE_EVENT`. This event is similar to ROTATE_EVENT, but it's artificial and its purpose is to tell the replica server which the binlog file name of the master is.

This matters when the replica connects with the GTID option (no filename is given) or when using file and pos with empty file name (usually file='' and pos = 4).

The Event Type is `ROTATE_EVENT` (`0x4`).

> **Note:**
>
> The fake `ROTATE_EVENT` event is not written in the binlog file. It's created by the master and sent to newly connected replica before FORMAT_DESCRIPTION_EVENT

Header

- Timestamp set to `0`.

- Event Type is `ROTATE_EVENT`.
- Next Pos is set to `0`.
- Flags are set to `LOG_ARTIFICIAL_F` (`0x20`).

Content

The content is the same as ROTATE_EVENT.

- pos = the requested pos from slave, usually `4`.
- filename = the master binlog filename.

If it is the first fake rotate event, and the global server variable `@@binlog_checksum` is set to `CRC32`:

- crc32_checksum (4 Bytes).

This page is licensed: CC BY-SA / Gnu FDL

FORMAT_DESCRIPTION_EVENT

This is a descriptor event that is written to the beginning of a binary log file, at position 4 (after the 4 magic number bytes). The whole event written to disk is byte<19> event header + data fields.

Header

- The Event Type is 15 (0x0f).

Fields

- uint<2> The binary log format version. This is `4` .
- string<50> The MariaDB server version (example: 10.8.1-debug-log), padded with 0x00 bytes on the right.
- uint<4> Timestamp in seconds when this event was created (this is the moment when the binary log was created). This value is redundant; the same value occurs in the timestamp header field.
- uint<1> The header length. This length `-19` gives the size of the extra headers field at the end of the header for other events.
- byte<n> Variable-sized. An array that indicates the post-header lengths for all event types. There is one byte per event type that the server knows about. The value 'n' comes from the following formula:

```
n = event_size - header length - offset (2 + 50 + 4 + 1) - checksum_algo - checksum
```

- uint<1> Checksum Algorithm Type
- uint<4> CRC32 4 bytes (value matters only if checksum algo is CRC32)

Example FDE of MariaDB With CRC32

GTID_EVENT

For global transaction ID, used to start a new transaction event group, instead of the old `BEGIN` query event, and also to mark stand-alone (DDL).

`GTID_EVENT` event type is `162` (`0xa2`).

Event Header

- Type[1] = `0xa2`.
- Flags[2] = 08 00 => `LOG_EVENT_SUPPRESS_USE_F`.

Fields

- uint<8> GTID sequence.
- uint<4> Replication Domain ID.
- uint<1> Flags.

If flag & `FL_GROUP_COMMIT_ID`:

- uint<8> commit_id.

Else if flag & (`FL_PREPARED_XA` or `FL_COMPLETED_XA`):

- uint<4> format_id.
- uint<1> gtid_length.
- uint<1> bqual_length.
- byte<n> xid, where n is sum of gtrid and bqual lengths.

Else:

- uint<6> 0.

Flags

Flag	Value	Details
FL_STANDALONE	1	Set when there is no terminating `COMMIT` event.
FL_GROUP_COMMIT_ID	2	Set when event group is part of a group commit on the master. Groups with same commit_id are part of the same group commit.

Flag	Value	Details
FL_TRANSACTIONAL	4	Set for an event group that can be safely rolled back (no MyISAM, for instance).
FL_ALLOW_PARALLEL	8	Reflects the (negation of the) value of `@@SESSION.skip_parallel_replication` at the time of commit.
FL_WAITED	16	Set if a row lock wait (or other wait) is detected during the execution of the transaction.
FL_DDL	32	Set for event group containing DDL.
FL_PREPARED_XA	64	Set for XA transaction.
FL_COMPLETED_XA	128	XA transaction completed (committed or rolled back).

Transaction Example From mysqlbinlog Utility

Content

- GTID seq[8] = 9b 26 00 00 00 00 00 00 => 9883.
- domain id[4] = 00 00 00 00 00 => 0.
- flags[1] = 29 => 41 (`FL_DDL` =32 + `FL_ALLOW_PARALLEL` =8 + `FL_STANDALONE` =1).
- commit_id[6] = 00 00 00 00 00 00 = 0.
- CRC32[4] = 8e 66 9a 30.

Example GTID_EVENT With a Transaction and CRC32

```
ec d5 26 5a a2 8c 27 00  00 2a 00 00 00 8c 02 00 ..&Z..'..*......
00 08 00 9c 26 00 00 00  00 00 00 00 00 00 00 0c ....&...........
00 00 00 00 00 00 37 d3  c8 23                   ......7..#
```

Content

- GTID seq[8] = 9c 26 00 00 00 00 00 00 => 9884.
- domain id[4] = 00 00 00 00 00 => 0.
- flags[1] = 0c => 12 (`FL_ALLOW_PARALLEL` =8 + `FL_TRANSACTIONAL` =4).

- commit_id[6] = 00 00 00 00 00 00 = 0.
- CRC32[4] = 37 d3 c8 23.

This page is licensed: CC BY-SA / Gnu FDL

GTID_LIST_EVENT

Logged in every binlog to record the current replication state. Consists of the last GTID seen for each replication domain.

The Global Transaction ID, GTID for short, consists of three components:

- Replication domain ID;
- Master server ID;
- Sequence ID.

It's represented as three numbers separated with dashes (`-`); for example: `1-1222-1011` .

It's usually written after the Format Description Event. If binary log encryption is enabled, it is written after the Start Encryption Event.

> **Note:**
>
> In case of encrypted binlog files (encrypt_binlog is set to `ON`), this event is written just after the START_ENCRYPTION_EVENT.

Header

- Event type is 163 (0xa3).

Fields

- uint<4> Number of GTIDs.
- For (i=0; i < gtid_count; i++):
  - uint<4> Replication Domain ID.
  - uint<4> Server_ID.
  - uint<8> GTID sequence.

The minimum content size for one GTID is `4 + (4 + 4 + 8) * 1 = 20 bytes` .

Example With 1 GTID, With CRC32

From the mysqlbinlog utility:

170824 9:52:04 server id 10124 end_log_pos 292 CRC32 **0xb6d8f0a8** Gtid list **[0-10124-3584]**

```
a4 85 9e 59 a3 8c 27 00  00 2b 00 00 00 24 01 00  ...Y..'..+...$..
00 00 00 01 00 00 00 00  00 00 00 8c 27 00 00 00  ............'...
0e 00 00 00 00 00 00 a8  f0 d8 b6                 ..........
```

Header, 19 Bytes

- Event Time = a4 85 9e 59 ===> 2017-08-24 9:52:04.
- Event Type = a3 => 163.
- Server_id = 8c 27 00 00 => 00 00 27 8c => 10124.
- Event Size = 2b => 43 (header[19] + 1 GTID(20 bytes) + CRC32[4].
- Next Pos = 24 01 00 00 => 00 00 01 24 => 292.

- Flags = 00 => 0.

Content, Variable Size, is (4 + (4 + 4 + 8) * n_GTIDs) Bytes

The content example with one GTID is 20 bytes + 4 bytes CRC32:

- Number of GTIDs[4] = 01 00 00 00 => 1.
- GTID[0] replication_domain[4] = 00 00 00 00 => 0.
- GTID[0] Server_id[4] = 8c 27 00 00 => 00 00 27 8c => 10124.
- GTID[0] Sequence[8] = 00 0e 00 00 00 00 00 00 ===> 3584.
- crc32[4] = a8 f0 d8 b6 => b6 d8 f0 a8 => 0xb6d8f0a8.

This page is licensed: CC BY-SA / Gnu FDL

HEARTBEAT_LOG_EVENT

This event does not appear in the binary log. It's only sent over the network by a master to a replica server to let it know that the master is still alive, and is only sent when the master has no binlog events to send to replica servers.

> **Note:**
>
> This event is never written to the binary log file.

Header

- Timestamp is set to `0`.
- Next position is set to last position.
- Type is set to `HEARTBEAT_EVENT` (`0x1b`).

Fields

- string<EOF> The current master binary log name.

Example of Transmission (Without CRC32)

```
T 127.0.0.1:8808 -> 127.0.0.1:57157 [AP]
  23 00 00 04 00 00 00 00    00 1b 67 2b 00 00 22 00    '.........g+..&.
  00 00 ed 01 00 00 20 00    66 6f 6f 2d 62 69 6e 2e    ......  .log-bin.
  31 30 30 30 31 33 39                                  1000139
```

Network Replication protocol, 5 bytes

- packet size [3] = 23 00 00 => 00 00 23 => 35 (ok byte + event size).
- pkt sequence [1] = 04.
- `OK` indicator [1] = 0 (`OK`).

Heartbeat Event

Header

- Timestamp [4] = 00 00 00 00 => 0.
- Event Type [1] = 1b => 27.
- Server_id [4] = 67 2b 00 00 => 00 00 2b 67 => 111111.
- Event Size [4] = 22 00 00 00 => 00 00 00 26 => 34 (header + data).
- Next_pos [4] = ed 01 00 00 => 00 00 01 ed => 493.
- Flags [2] == 20 00 => 00 20 = > 32.

Content, String<EOF>

- log-bin.1000139.

This page is licensed: CC BY-SA / Gnu FDL

INTVAR_EVENT

An `INTVAR_EVENT` is written every time a statement uses an auto increment column or the `LAST_INSERT_ID()` function.

Header

- Event Type is `5` (`0x05`).

Fields

- uint<1> Type.
- uint<8> Value.

Type

0x00	Invalid value.
0x01	LAST_INSERT_ID.
0x02	Insert id (auto_increment).

Example From mysqlbinlog Utility, CRC32

```
# at 738
#180610 11:20:56 server id 1  end_log_pos 770 CRC32 0xf5a23f2d  Intvar
SET LAST_INSERT_ID=1/*!*/;
```

Example Event As It's Written In The Binlog File

```
78 ed 1c 5b 05 01 00 00 00 20 00       x..[..... .
00 00 02 03 00 00 00 00 01 01 00 00 00 00 00 00  ................
00 2d 3f a2 f5                                   .-?..
```

This page is licensed: CC BY-SA / Gnu FDL

QUERY_EVENT

This event is written into the binary log file for:

- Statement-based replication (updating statements).
- DDLs.
- COMMIT related to nontransactional engines (like MyISAM or BLACKHOLE).

Header

- Event Type = 0x02.

Fields

Fixed data part:

- uint<4> The ID of the thread that issued this statement on the master.
- uint<4> The time in seconds that the statement took to execute.

- uint<1> The length of the name of the database which was the default database when the statement was executed. This name appears later, in the variable data part. It is necessary for statements such as `INSERT INTO t VALUES(1)` that don't specify the database and rely on the default database previously selected by `USE`.
- uint<2> The error code resulting from execution of the statement on the master.
- uint<2> The length of the status variable block.

Variable data part:

- byte<n> Zero or more status variables. Each status variable consists of one byte code identifying the variable stored, followed by the value of the variable. The format of the value is variable-specific.
  The number of bytes 'n' is the length of the status variable block (read in fixed data part).
- string<NUL> The default database name (null-terminated).
- string<EOF> The SQL statement. By subtraction the size of the statement can be known.

Status Variables

Q_FLAGS2_CODE (0x00)

- uint<4> bitmask.

Value	Option
0x00004000	OPTION_AUTO_IS_NULL
0x00080000	OPTION_NOT_AUTOCOMMIT
0x04000000	OPTION_NO_FOREIGN_KEY_CHECKS
0x08000000	OPTION_RELAXED_UNIQUE_CHECKS

Q_SQL_MODE_CODE (0x01)

- uint<8> 8-byte bitmask.

Value	Option
0x00000001	MODE_REAL_AS_FLOAT
0x00000002	MODE_PIPES_AS_CONCAT
0x00000004	MODE_ANSI_QUOTES
0x00000008	MODE_IGNORE_SPACE
0x00000010	MODE_NOT_USED
0x00000020	MODE_ONLY_FULL_GROUP_BY
0x00000040	MODE_NO_UNSIGNED_SUBTRACTION
0x00000080	MODE_NO_DIR_IN_CREATE
0x00000100	MODE_POSTGRESQL
0x00000200	MODE_ORACLE
0x00000400	MODE_MSSQL
0x00000800	MODE_DB2
0x00001000	MODE_MAXDB
0x00002000	MODE_NO_KEY_OPTIONS
0x00004000	MODE_NO_TABLE_OPTIONS
0x00008000	MODE_NO_FIELD_OPTIONS
0x00010000	MODE_MYSQL323

Value	Option
0x00020000	MODE_MYSQL40
0x00040000	MODE_ANSI
0x00080000	MODE_NO_AUTO_VALUE_ON_ZERO
0x00100000	MODE_NO_BACKSLASH_ESCAPES
0x00200000	MODE_STRICT_TRANS_TABLES
0x00400000	MODE_STRICT_ALL_TABLES
0x00800000	MODE_NO_ZERO_IN_DATE
0x01000000	MODE_NO_ZERO_DATE
0x02000000	MODE_INVALID_DATES
0x04000000	MODE_ERROR_FOR_DIVISION_BY_ZERO
0x08000000	MODE_TRADITIONAL
0x10000000	MODE_NO_AUTO_CREATE_USER
0x20000000	MODE_HIGH_NOT_PRECEDENCE
0x40000000	MODE_NO_ENGINE_SUBSTITUTION
0x80000000	MODE_PAD_CHAR_TO_FULL_LENGTH

Q_CATALOG_NZ_CODE (0x02)

- uint<1> length
- string<length +1> catalog name + '\0'

Q_AUTO_INCREMENT (0x03)

- uint<2> auto_increment increment
- uint<2> auto_increment offset

Q_CHARSET_CODE (0x04)

- uint<2> client character set
- uint<2> collation_connection
- uint<2> collation_server

Q_TIMEZONE_CODE (0x05)

- uint<1> length
- string<length> time zone

Q_CATALOG_NZ_CODE (0x06)

- uint<1> length
- string<length> catalog

Q_LC_TIME_NAMES_CODE (0x07)

- uint<2> code
  The mapping between code and names are defined in sql_locale.cc.

Q_CHARSET_DATABASE_CODE (0x08)

- uint<2> database collation

Q_TABLE_MAP_FOR_UPDATE_CODE (0x09)

- uint<8> table bittmask
  Every bit of this variable represents a table, and is set to 1 if the corresponding table is to be updated by this statement.

Q_MASTER_DATA_WRITTEN_CODE (0x0A)

- Not in use any more
- uint<4> original event length

Q_INVOKER (0x0B|)

- uint<1> user name length
- string<length> user name
- uint<1> host name length
- string<length> host name

Q_UPDATED_DB_NAMES (0x0C)

- MySQL only
- uint<1> count
- for (i=0;i < count; i++)
  - string Null terminated database name

Q_MICROSECONDS (0x0D)

- MySQL only
- uint<3> microsecond part

Q_HRNOW (0x80)

- MariaDB only
- uint<3> microsecond part

Q_XID (0x81)

- MariaDB only
- uint<8> xid

Example With CRC32

```
71 17 28 5a 02 8c 27 00  00 55 00 00 00 01 09 00  q.(Z..'..U......
00 00 00 66 01 00 00 00  00 00 00 00 00 00 1a 00  ...f............

34 4a 69 9e ed                                    4Ji..
```

Header, 19 Bytes

- Event Time[4] = 71 17 28 5a ===> 1512576881.
- Event Type[1] = 2.
- Server_id[4] = 8c 27 00 00 ===> 10124.
- Event Size = 55 00 00 00 ===> 85.
- Next Pos = 01 09 00 00 ===> 2305.

- Flags = 00 00 => 0.

Content, Variable Data

- Thread ID[4] = 66 01 00 00 ===> 358.
- Execution Time[4] = 00 00 00 00 => 0 seconds.
- Statement default database name len[1] = 00 => 0 (no default database).
- Error code[2] = 00 00 => 0 (no errors).
- Status variable block len[2] = 1a 00 => 26.
- Status variables[n] = 00 … 08 00.
- The default database[string] = 00 = 0 (no default database).
- The SQL statement[string] = `TRUNCATE TABLE` test.t4.

CRC32, 4 Bytes

- 4a 69 9e ed.

Example With Default Database and CRC32

```
MariaDB []> use test;
Database changed
MariaDB [test]> TRUNCATE TABLE t4;
...

ce 22 28 5a 02 8c 27 00  00 54 00 00 00 87 0c 00  ."(Z..'..T......
00 00 00 66 01 00 00 01  00 00 00 04 00 00 1a 00  ...f............
00 00 00 00 00 01 00 00  00 50 00 00 00 00 06 03  .........P......
73 74 64 04 08 00 08 00  08 00 74 65 73 74 00 54  std.......test.T
52 55 4e 43 41 54 45 20  54 41 42 4c 45 20 74 34  RUNCATE TABLE t4
08 f1 09 16                                       ....
```

Content, Variable Data

- Thread ID[4] = 66 01 00 00 ===> 358.
- Execution Time[4] = 10 00 00 00 => 1 second.
- Statement default database name len[1] = 04 => 4 (default database is “test”).
- Error code[2] = 00 00 => 0 (no errors).
- Status variable block len[2] = 1a 00 => 26.
- Status variables[n] = 00 … 08 00.
- The default database[string] = 74 65 73 74 00 ⇒ test.
- The SQL statement[string] = `TRUNCATE TABLE` test.t4.

This page is licensed: CC BY-SA / Gnu FDL

RAND_EVENT

The SQL function RAND() generates a random number.

A `RAND_EVENT` contains two seed values that set the rand_seed1 and rand_seed2 system variables that are used to compute the random number.

> **Note:**
>
> It is written only before a `QUERY_EVENT` , and not used with row-based logging.

Header

- Event Type is `13` (`0x0d`).

Fields

- uint<8> The value for the first seed.
- uint<8> The value for the second seed.

Example From mysqlbinlog Utility, No CRC32

```
# at 389
#171206 13:46:56 server id 10116  end_log_pos 424   Rand
SET @@RAND_SEED1=685157301, @@RAND_SEED2=758850369/*!*/;
# at 424
```

Example Event as Written to the Binlog File

`c0 e6 27 5a 0d 84 27 00 00 23 00 00 00 a8 01 00 ..'Z..'..#..... 00 00 00 b5 ab d6 28 00 00 00 00 41 23 3b 2d 00 ......(..... 00 00 00 ....`

This page is licensed: CC BY-SA / Gnu FDL

ROTATE_EVENT

When a binary log file exceeds the configured size limit, a `ROTATE_EVENT` is written at the end of the file, pointing to the next file in the sequence.

`ROTATE_EVENT` is generated locally and written to the binary log on the master. It is also written when a FLUSH LOGS statement occurs on the master server.

The `ROTATE_EVENT` is sent to the connected replica servers.

Header

- The Event Type is `ROTATE_EVENT` (`0x4`).

Fields

- uint<8> The position of the first event in the next log file. It always contains the number `4` (meaning the next event starts at position 4 in the next binary log).
- string<EOF> The next binary log name. The filename is not null-terminated.

Example of Transmission With CRC32 (The Last 4 Bytes)

```
T 127.0.0.1:8808 -> 127.0.0.1:57157 [AP]
  30 00 00 4d 00 bc 4e 21    5a 04 d9 27 00 00 2f 00    0..M..N!Z..'../.
  00 00 c0 01 00 00 00 00    04 00 00 00 00 00 00 00    ................
  6d 79 73 71 6c 2d 62 69    6e 2e 30 30 30 30 31 39    mysql-bin.000019
  b2 bc db bf                                           ....
```

This page is licensed: CC BY-SA / Gnu FDL

ROWS_EVENT_V1/V2, ROWS_COMPRESSED_EVENT_V1

A `ROWS_EVENT_V1` is written for row-based replication if data is inserted, deleted or updated.

A `ROWS_EVENT` (version 2) is written for row based replication if data is inserted, deleted or updated. MariaDB Server doesn't send version 2 row events.

Event types

Event	Details
WRITE_ROWS_EVENT_V1	Insert new row.
UPDATE_ROWS_EVENT_V1	Update existing row.
DELETE_ROWS_EVENT_V1	Delete existing row.
WRITE_ROWS_COMPRESSED_EVENT_V1	Insert new row.
UPDATE_ROWS_COMPRESSED_EVENT_V1	Update existing row.
DELETE_ROWS_COMPRESSED_EVENT_V1	Delete existing row.
WRITE_ROWS_EVENT	Insert new row (version 2, MySQL only).
UPDATE_ROWS_EVENT	Update existing row (version 2, MySQL only).
DELETE_ROWS_EVENT	Delete existing row (version 2, MySQL only).

Header

- `WRITE_ROWS_EVENT_V1` : Event Type is 23 (0x17).
- `UPDATE_ROWS_EVENT_V1` : Event Type is 24 (0x18).
- `DELETE_ROWS_EVENT_V1` : Event Type is 25 (0x19).
- `WRITE_ROWS_EVENT` : Event Type is 30 (0x1E).
- `UPDATE_ROWS_EVENT` : Event Type is 31 (0x1F).
- `DELETE_ROWS_EVENT` : Event Type is 32 (0x20).
- `WRITE_ROWS_COMPRESSED_EVENT_V1` : Event Type is 166 (0xA6).
- `UPDATE_ROWS_COMPRESSED_EVENT_V1` : Event Type is 167 (0xA7).
- `DELETE_ROWS_COMPRESSED_EVENT_V1` : Event Type is 168 (0xA8).

Fields

- uint<6> The table id.
- uint<2> Flags.
- If `rows_event` is version 2:
  - uint<2> Extra data length.
  - string<len> Extra data.
- uint Number of columns.
- byte<n> Columns used. n = (number_of_columns + 7)/8.
- If (event_type == `UPDATE_ROWS_EVENT_v1`):
  - byte Columns used (Update). n = (number_of_columns + 7)/8.
- If `*_COMPRESSED_EVENT_V1` :
  - byte<1> header.
    - algorithm: (header & 0x07) >> 4 (always 0=zlib).
    - header_size: header & 0x07.
  - byte<header_size>uncompressed length, stored in MyISAM format.
- byte<n> Null Bitmap (n = (number_of_columns + 7)/8).
- string<len> Column data. The length needs to be calculated by checking the column types from referring `TABLE_MAP_EVENT` .
- If (event_type == `UPDATE_ROWS_EVENT_v1`):
  - byte<n> Null Bitmap_Update. n = (number_of_columns + 7)/8.

- string<len>
- g Update Column data. The length needs to be calculated by checking the used columns bitmap and column types from referring `TABLE_MAP_EVENT`.

Table ID

Table id refers to a table defined by TABLE_MAP_EVENT. The special value `0xFFFFFF` should have “end of statement flag” (`0x0001`) set and indicates that table maps can be freed.

Flags

Flag	Details
0x0001	End of statement.
0x0002	No foreign key checks.
0x0004	No unique key checks.
0x0008	Indicates that rows in this event are complete.
0x0010	No check constraints.

Extra data length (version 2)

The length of extra data.

Extra data (version 2)

Extra data, length is extra data length `-2`.

Column Data Formats

The row data is stored in a packed format where each field is encoded in a particular format. The encoding is almost identical to the binary protocol but there are a few differences.

The field metadata is stored in the metadata block of the TABLE_MAP_EVENT. The metadata is required to decode the events. The following list shows number of bytes a field uses from the metadata block.

- 2 bytes
  - MYSQL_TYPE_BIT
  - MYSQL_TYPE_ENUM
  - MYSQL_TYPE_SET
  - MYSQL_TYPE_NEWDECIMAL
  - MYSQL_TYPE_DECIMAL
  - MYSQL_TYPE_VARCHAR
  - MYSQL_TYPE_VAR_STRING
  - MYSQL_TYPE_STRING
- 1 byte
  - MYSQL_TYPE_TINY_BLOB
  - MYSQL_TYPE_MEDIUM_BLOB
  - MYSQL_TYPE_LONG_BLOB
  - MYSQL_TYPE_BLOB
  - MYSQL_TYPE_TIMESTAMP2
  - MYSQL_TYPE_DATETIME2
  - MYSQL_TYPE_TIME2

- MYSQL_TYPE_FLOAT
- MYSQL_TYPE_DOUBLE

The types that aren't listed here do not store data in the metadata block.

Simple Types

Type	Details
MYSQL_TYPE_NULL	Bit set in null bitmap, no value in row data.
MYSQL_TYPE_TINY	1 byte integer.
MYSQL_TYPE_YEAR	1 byte integer (year = value + 1900).
MYSQL_TYPE_SHORT	2 byte integer.
MYSQL_TYPE_INT24	3 byte integer.
MYSQL_TYPE_LONG	4 byte integer.
MYSQL_TYPE_LONGLONG	8 byte integer.
MYSQL_TYPE_FLOAT	4 byte floating-point value (stored as a C float type).
MYSQL_TYPE_DOUBLE	8 byte floating-point value (stored as a C double type).

`MYSQL_TYPE_BLOB` and other blob types

Stored as a length-encoded string where the string is preceded by a variable-sized integer that stores the length of the blob. The size of the preceding integer in bytes is stored as a one byte integer in the table metadata that is a part of the table map event.

For example, if the value 4 is stored in the table metadata, the length is stored as a 4 byte integer (for instance, `uint32_t`) followed by the data.

The exact `column_type` can be determined by the metadata length:

Length	Type
1	MYSQL_TYPE_TINY_BLOB
2	MYSQL_TYPE_BLOB
3	MYSQL_TYPE_MEDIUM_BLOB
4	MYSQL_TYPE_LONG_BLOB

`MYSQL_TYPE_STRING`, `MYSQL_TYPE_SET` and `MYSQL_TYPE_ENUM`

Stored as a fixed-length string with the length of the string stored in the second byte of the table metadata. All three of these types are stored as `MYSQL_TYPE_STRING` in the binlog and the real type of the field is stored in the first byte of the metadata.

`MYSQL_TYPE_VARCHAR` and other variable length string types

Stored as a length-encoded string where the string is preceded by a variable-sized integer that stores the length of the string. The field length is stored as a two byte integer in the table metadata.

If the field length is larger than 255, the string length is stored as a two byte integer. If the value is equal to or less than 255, the string length is stored as a one byte integer.

`MYSQL_TYPE_DATETIME`

This field type is only used in MariaDB if the global variable `mysql56_temporal_format` is set to `OFF`.
Stored as an 8 byte value with the values stored as multiples of 100. This means that the stored value is in the

format `YYYYMMDDHHMMSS` , and can be extracted by repeatedly calculating the remainder of dividing the value by 100 and dividing the value by 100. The following pseudo-code demonstrates extracting the value.

```
value = read_8_byte_value(row_data)
date_val= value / 1000000
time_val= value % 1000000

year = (date_val / 100) / 100
month = (date_val / 100) % 100
day = date_val % 100
hour= (time_val / 100) / 100
minute = (time_val / 100) % 100
second = time_val % 100
```

`MYSQL_TYPE_TIME`

This field type is only used in MariaDB if the global variable `mysql56_temporal_format` is set to `OFF`.
Stored as a 3 byte value with the values stored as multiples of 100. This means that the stored value is in the format `HHMMSS` and can be extracted in the same way a `MYSQL_TYPE_DATETIME` is extracted. The following pseudo-code demonstrates extracting the value.

```
time_val = read_3_byte_value(row_data); /* myisam pack format */
hour= (time_val / 100) / 100;
minute = (time_val / 100) % 100;
second = time_val % 100;
```

`MYSQL_TYPE_DATETIME2`

Stored as 4-byte value The number of decimals for the fractional part is stored in the table metadata as a one byte value. The number of bytes that follow the 5 byte datetime value can be calculated with the following formula: `(decimals + 1) / 2` .

```
val = read_5_byte_value(row_data) - 0x8000000000
d_val= val >> 17;
t_val = val % (1 << 17);

day= d_val % (1 << 5);
month= (d_val >> 5) % 13;
year= (d_val >> 5) / 13;
second= t_val % (1 << 6);
minute= (t_val >> 6) % (1 << 6);
hour= (t_val)(time_part >> 12);
```

`MYSQL_TYPE_TIME2`

Stored as 3-byte value. The number of decimals for the fractional part is stored in the table metadata as a one byte value. The number of bytes that follow the 3 byte time value can be calculated with the following formula: `(decimals + 1) / 2` .

```
t_val = read_3_byte_value(row_data) - 0x800000
if (t_val < 0)
{
  signed= 1;
  t_val= - tval;
}
hour= (t_val >> 12) % (1 << 10);
minute= (t_val >> 6) % (1 << 6);
second= t_val % (1 << 6);
```

`MYSQL_TYPE_TIMESTAMP2`

Stored as a 4 byte UNIX timestamp (number of seconds since 00:00, Jan 1 1970 UTC) followed by the fractional second parts. The number of decimals for the fractional part is stored in the table metadata as a one byte value. The number of bytes that follow the 4 byte timestamp can be calculated with the following formula: `(decimals + 1) / 2`

Microseconds for `MYSQL_TYPE_DATETIME2`, `MYSQL_TYPE_TIME2`, and `MYSQL_TYPE_TIMESTAMP`.

```
len = (decimals + 1) / 2
  val= read_len_byte_value(row_data)
  llen= 0: microseconds= 0
  len = 1 or 2: microseconds = val * 10000
  len = 3 or 4: microseconds = 2-bytes val in myisam pack format
  len = 5 or 6: microseconds = 3-bytes val in myisam pack format
```

`MYSQL_TYPE_DATE`

Stored as a 3 byte value where bits 1 to 5 store the day, bits 6 to 9 store the month and the remaining bits store the year.

`MYSQL_TYPE_TIMESTAMP`

Stored as a 4 byte UNIX timestamp (number of seconds since 00:00, Jan 1 1970 UTC).

Example From mysqlbinlog Utility, CRC32

```
# at 1680
#180611  9:50:51 server id 1  end_log_pos 1754 CRC32 0x5415a8fb     Write_rows: table id 23 flags:

```

This page is licensed: CC BY-SA / Gnu FDL

START_ENCRYPTION_EVENT

The `START_ENCRYPTION` event is written to every binary log file if encrypt_binlog is set to `ON`.

This event is written just once, after the Format Description event (which is the first event of a binlog file at pos 4).

The event has the 19 bytes event header with EventType set to value `164` (`0xa4`) + 17 bytes data.

Header

- Event type is `164` (`0xa4`).

Fields

- uint<1> The Encryption scheme, always set to 1 for system files.
- uint<4> The Encryption key version.
- byte<12> Nonce (12 random bytes) of current binlog file.

Decryption of Following Events

All data of following events in the binlog file are encrypted, except for the `event_length` field.

The 16 byte encryption IV is generated from the 12 byte nonce (uint<12>) in the binlog plus the current position of the event being encrypted (uint<4>). This means the last four bytes of the IV change for every event and the first 12 bytes change for every binlog file.

Since the `event_length` is always unencrypted, the encrypted data block has to be modified before it can be decrypted:

- Store event_length.
- Copy the first four bytes (encrypted timestamp) to event_length position (offset=9).
- Decrypt starting from offset 4 and store result at offset 4 of decrypted buffer.

The unencrypted block now also needs to be modified:

- Move unencrypted timestamp value from offset 9 to the beginning (offset=0).
- Store event_length at position 9.

Complete example with CRC32 from a binary log.

```
b8 5f 5a 59 a4 5d 00 00  00 28 00 00 00 21 01 00 ._ZY.]...(...!..
00 00 00 01 01 00 00 00  65 57 50 26 63 59 37 46 ........eWP&cY7F
2f 3b 33 23 06 bb da 62                          /;3#...b
```

Header, 19 Bytes

- timestamp [4] = b8 5f 5a 59 => 59 5a 5f b8 => 1499094968 [2017-07-03 17:16:08].
- type [1} = a4 => 164.
- server_id [4} = 5d 00 00 00 => 00 00 00 5d => 93.
- event_size [4] = 28 00 00 00 => 00 00 00 28 => 40 [header + content + crc32(header + content)].
- next_pos [4] = 21 01 00 00 => 00 00 01 21 => 289.
- flags [2] = 00 00 => 0.

Content, 17 Bytes

- Enc scheme [1] = 01 => 1.
- Enc key ver [4] = 01 00 00 00 => 00 00 00 01 => 1.
- Nonce [12] = eWP&cY7F/;3#.

CRC32, 4 bytes, of the Whole Event (Header[19] + Content[17])

- 06 bb da 62 => 62 da bb 06 => 1658501894.

This page is licensed: CC BY-SA / Gnu FDL

STOP_EVENT

The master server writes the event to the binary log when it shuts down, or when resuming after a mariadbd process crash.

A new binary log file is always created, but there is no `ROTATE_EVENT`.

`STOP_EVENT` is the last written event after a clean shutdown, or when resuming after a crash.

> **Warning:**
>
> This event is never sent to replica servers.

Header

- Event header with EventType set to `STOP_EVENT` (`0x03`).
- Event header NextPos set to `EOF`.
- No special flags added.

Fields

- The event has no data.

Example With CRC32 (Last 4 Bytes)

Event size = header[19] + 0 bytes data + 4 CRC32 = 23.

```
3a b8 15 5a 03 01 00 00  00 17 00 00 00 09 0c 00  ..Z............
00 00 00 4e 99 ee 2c                              ...N..,
```

This page is licensed: CC BY-SA / Gnu FDL

TABLE_MAP_EVENT

Used for row-based binary logging beginning (binlog_format=`ROW` or `MIXED`).

This event precedes each row operation event and maps a table definition to a number, where the table definition consists of database and table names.

Header

- Event Type is `19` (`0x13`).

Fields

Fixed Data Part

- uint<6> The table ID.
- uint<2> Reserved for future use.

Variable Data Part

- uint<1> Database name length.
- string<NUL> The database name (null-terminated).
- uint<1> Table name length.
- string<NUL> The table name (null-terminated).
- int<lenenc> The number of columns in the table.
- byte<n> An array of ‘n’ column types, one byte per column.
- int<lenenc> The length of the metadata block.
- byte<n> The metadata block;
- byte<n> Bit-field indicating whether each column can be `NULL`, one bit per column.

- If (more_data_available):
  - byte<n> Optional metadata block.

Metadata Block

The metadata block contains type specific metadata information for each column.

Type	Length	Description
MYSQL_TYPE_BLOB	1	Number of bytes for length: e.g. 4 bytes means length is stored in a 4 byte integer).
MYSQL_TYPE_DATETIME2	1	Length of microseconds.
MYSQL_TYPE_DECIMAL	2	Not in use anymore.
MYSQL_TYPE_DOUBLE ,MYSQL_TYPE_FLOAT	1	length (4 or 8 bytes).
MYSQL_TYPE_STRING	2	The first byte contains type (`MYSQL_TYPE_STRING` , `MYSQL_TYPE_ENUM` , or `MYSQL_TYPE_SET`). The second byte contains the length.
MYSQL_TYPE_NEWDECIMAL	2	Precision, Scale.
MYSQL_TYPE_TIME2	1	Length in microseconds.
MYSQL_TYPE_TIMESTAMP2	1	Length in microseconds.
MYSQL_TYPE_VARCHAR, MYSQL_TYPE_VAR_STRING	2	Defined varchar length. If the value is > 255, the length is stored in 2 bytes, otherwise in 1 byte.

Optional Metadata Block

Optional metadata are available if the global server variable `BINLOG_ROW_METADATA` is set to `MIN` or `FULL` .

The metadata block consists of one or more of the following blocks:

- byte<1> Optional metadata type.
- int<lenenc> Length.
- byte<len> Data.

Optional metadata types:

Name	Value	Mode	Description
SIGNEDNESS	1	MIN	Data contains a bitmap indicating which integer columns are signed.
DEFAULT_CHARSET	2	MIN	Character set of string columns, used if most columns have the same result. Columns with other character sets will follow as pair (column_index, collation number).
COLUMN_CHARSET	3	MIN	Character set of columns, used if columns have different character sets. Returned as a sequence of collation numbers.
COLUMN_NAME	4	FULL	List of Column names, the first byte specifies the length of the column name.
SET_STR_VALUE	5	FULL	List of set values: First byte is the number of different values, followed by length/value pairs.
ENUM_STR_VALUE	6	FULL	Same as SET_STR_VALUE. Since ENUM values might have up to 0xFFFF members, the number of values is a length encoded integer.
GEOMETRY_TYPE	7	FULL	A sequence of bytes representing the type of `GEOMETRY` columns: 0 = `GEOMETRY` , 1 = `POINT` , 2 = `LINESTRING` , 3 = `POLYGON` , 4= `MULTIPOINT` , 5 = `MULTILINESTRING` , 6 = `MULTIPOLYGON` , 7 = `GEOMETRYCOLLECTION` .

Name	Value	Mode	Description
SIMPLE_PRIMARY_KEY	8	FULL	A sequence of length encoded column indexes.
PRIMARY_KEY_WITH_PREFIX	9	FULL	A sequence of length encoded column indexes and prefix lengths.
ENUM_AND_SET_DEFAULT_CHARSET	10	FULL	The default character set number used for `ENUM` and `SET` columns.
ENUM_AND_SET_COLUMN_CHARSET	11	FULL	Character set of `ENUM` and `SET` columns, used if these columns have different character sets. Returned as a sequence of collation numbers.

Example From mysqlbinlog

```
# at 847
#171206 13:43:00 server id 10124  end_log_pos 892 CRC32 0xbe3c6b05  Table_map: `test`.`t4` mapped to
number 33
# at 892
```

Complete Event

```
d4 e5 27 5a 13 8c 27 00  00 2d 00 00 00 7c 03 00  ..'Z..'..-...|..
00 00 00 21 00 00 00 00  00 01 00 04 74 65 73 74  ...!........test
00 02 74 34 00 01 03 01  01 05 6b 3c be           ..t4......k<.
```

This page is licensed: CC BY-SA / Gnu FDL

USER_VAR_EVENT

A `USER_VAR_EVENT` is written every time a statement uses a user defined variable.

Header

- Event Type is `14` (`0x0e`).

Fields

- uint<4> The length of the user variable name.
- string<len> The name of the user variable.
- uint<1> `NULL` indicator.
- If (not null indicator):
  - uint<1> variable type.
  - uint<4> collation number.
  - uint<4> The length of value.
  - string<len> value.
  - uint<1> flags.

Variable type

Value	Type	Example
0x00	STRING_RESULT	set @a:=“foo”
0x01	REAL_RESULT	set @a:= @@timestamp
0x02	INT_RESULT	set @a:= 4

Value	Type	Example
0x03	ROW_RESULT	(not in use)
0x04	DECIMAL_RESULT	set @a:=1.2345

Flag

0x01	unsigned

Example for `SET @foo:="bar"` From mysqlbinlog Utility, CRC32

```
# at 511
#180610 10:26:43 server id 1  end_log_pos 554 CRC32 0x7dd93d6b  User_var
SET @`foo`:=_utf8 X'626172' COLLATE `utf8_general_ci`/*!*/;
```

Example Event as Written to the Binlog File

```
c3 e0 1c 5b 0e 01 00 00 00 2b 00       ...[.....+.
00 00 2a 02 00 00 00 00 03 00 00 00 66 6f 6f 00  ..*.........foo.
00 21 00 00 00 03 00 00 00 62 61 72 6b 3d d9 7d  .!.......bark=.}
....
```

This page is licensed: CC BY-SA / Gnu FDL

XA_PREPARE_LOG_EVENT

An `XA_PREPARE_LOG_EVENT` records the prepare phase of a distributed transaction using the XA log. It is used to ensure atomicity and consistency of transactions.

Header

- Event Type is `XA_PREPARE_LOG_EVENT` (`0x26`).

Fields

- uint<1> One Phase Commit.
- uint<4> Format ID.
- uint<4> Length of gtrid.
- uint<1> Length of bqual.

Payload:

- byte<n> xid, where n is sum of gtrid and bqual lengths.

This page is licensed: CC BY-SA / Gnu FDL

XID_EVENT

An XID event is generated for a `COMMIT` of a transaction that modifies one or more tables of an XA-capable storage engine.

Header

- Event Type is `XID_EVENT` (`0x10`).

Fields

uint<8> The XID transaction number.

Complete Example With CRC32

```
ee b7 15 5a 10 01 00 00  00 1f 00 00 00 f2 0b 00  ...Z............
00 00 00 66 00 00 00 00  00 00 00 09 30 45 a8     ...f........0E.
```

Header, 19 Bytes

Event size is: header[19] + XID[8] + CRC32[4] of (header + xid).

- Event Time ee b7 15 5a => 5a 15 b7 ee => 1511372782 [2017-11-22 18:46:22].
- Event Type = 10.
- Server_id 01 00 00 00 => 1.
- Event Size 1f 00 00 00 => 31.
- Next Pos f2 0b 00 00 => 00 00 0b f2 => 3058.
- Flags 00 00 = 0.

Content, 8 Bytes

- XID 66 00 00 00 00 00 00 00 => 102.

CRC32, 4 Bytes

- 09 30 45 a8 => a8 45 30 09 => 2823106569.

Product Development

> **Note:**
>
> This section contains background information, mostly aimed at engineers developing MariaDB features.

See MariaDB Quality Development Rules.

Outlines strict quality standards for new features, including requirements for design specifications, testability, and mandatory Worklog quality checklists.

See Uploading Package to PPA.

Provides instructions for developers to upload MariaDB source packages to a Personal Package Archive (PPA) using tools like dput for Ubuntu-based distributions.

See Debugging & Troubleshooting.

Offers deep-dive technical guides for diagnosing server issues, including trace file generation, debugger usage, and analyzing core dumps or memory usage.

See Plugin Development.

Details the APIs and processes for extending MariaDB functionality through custom plugins, such as authentication, logging, or specialized server enhancements.

See Server Development.

Covers foundational engineering topics, including the server roadmap, GitHub collaboration workflows, and quality assurance protocols for core contributions.

See MariaDB Internals.

Explores the low-level architecture of MariaDB, documenting source code internals, merging procedures, and how to use internal APIs in external programs.

This page is licensed: CC BY-SA / Gnu FDL

MariaDB Quality Development Rules

Those are quality-improving rules that everyone with a write access to the MariaDB repository is expected to follow:

- Respect previews
  - A feature can be pushed into an RC release X.Y.1 only after it was in an earlier preview. Normally, in X.Y.0, but generally any earlier preview will do.
- Tester sign-off for all new features
  - A feature being in the preview is a necessary, but not a sufficient condition. It needs to be tested (by a dedicated tester, not a developer) and the tester has to say it's good enough
  - Testing might discover bugs, that's normal, they have to be fixed before the feature is pushed (or — at the tester's discretion — they could be fixed after the push, if they're minor)
  - For tester's sake, develop in a dedicated branch with the version and the issue number in the branch name, for example, `bb-13.1-MDEV-11111`, and let the release master know when it's ready, so that they could cherry-pick it into a preview.
- Features must not be pushed directly into the GA release bypassing the above
  - Keep an eye on the release schedule (jira.mariadb.org) to know when the next release is due
  - Or simply remember that preview happen in mid-March/mid-June/mid-September/mid-December, innovation releases — in early February, early May, early August, early November, see mariadb-release-model.
- Get your commit reviewed.
  - If you don't know who would be the best reviewer for your PR, assign whoever github suggests — this person can reassign, if github was wrong
- Don't push into the red (in buildbot) branch
  - Fix failures first (or make sure they're fixed)
  - Eventually buildbot will evolve to simply not let you to
- Blocker issues block a release
  - we don't release if there's a Blocker bug open, that's why they're called blockers
  - so fix them asap, as your first priority, you don't want all the users to wait specifically for you
- There's no penalty for breaking these rules, we hope that everyone wants quality bug-free releases anyway
  - but if there will be serial violators, some kind of a penalty can be introduced later

This page is licensed: CC BY-SA / Gnu FDL

Uploading Package to PPA

After creating a Launchpad account:

Docker build, cloning the MariaDB repository and mapping it to the docker container

1. mkdir mariadb-source
2. cd mariadb-source
3. vi Dockerfile
4. Copy the following contents to Dockerfile:

```
# MariaDB 10.3 Ubuntu 17.10 build environment
# Published as mariadb-10-3-ubuntu-17.10-build-env
FROM ubuntu:17.10
RUN DEBIAN_FRONTEND=noninteractive apt-get update && \
apt-get install -y --no-install-recommends \
systemd \
devscripts \
build-essential \
lsb-release \
equivs \
git \
curl \
git-buildpackage \
nano \
vim \
pristine-tar

RUN curl -skO https://raw.githubusercontent.com/ottok/mariadb-10.1/ubuntu-17.10/debian/control

ENV GIT_SSL_NO_VERIFY true

RUN mk-build-deps -t 'apt-get -y -o Debug::pkgProblemResolver=yes --no-install-recommends' -i control

ENV container docker
ENV DEBIAN_FRONTEND noninteractive
ENV LANG C.UTF-8
ENV LC_ALL C.UTF-8
```

5. Run `docker build . -t ubuntu-17.10-packaging`
6. Do git clone of the latest repository:

`cd && mkdir debian-packaging && cd debian-packaging && git clone https://salsa.debian.org/mariadb-team/mariadb-10.1.git`

Generate, publish and upload PGP key

7. Generate OpenPGP key with the following command:

`$ gpg --gen-key`

- select (1) RSA and RSA
- Keysize: accept 2048
- Valid for: accept 0
- Type name, email and comment (comment is optional)
- Type 0
- Type passphrase (twice)
- Follow instructions to help generate a random key
- Keep the Key ID and fingerprint text, they are needed in the next step

Set generated key as default in `~/.bashrc`

`$ nano ~/.bashrc`

[.. add this ..]

`export GPGKEY=<key_id>`

Restart GPG-agent and source '/.bashrc', or restart session

8. Publish the key to the key server:

`gpg --keyserver keyserver.ubuntu.com --send-keys 12345678` and substitute `12345678` with your key's id

- If this gives timeout error, keep re-trying after a while

9. Upload the key's fingerprint here:
   Upload ImportingYourPGPKey fingerprint here +editpgpkeys
10. `gpg --export [your-key-id] > ~/debian-packaging/pub.key`
11. `gpg --export-secret-key [your-key-id] > ~/debian-packaging/secret.key`

`gpg -k`

^Should show the key

12. How to upload:How-to-upload-to-Launchpad-PPA-repository-(.deb-packages)
13. Open `/etc/devscripts.conf`

And look for this line:

`DEBSIGN_MAINT`

Uncomment it and add your name there

`export DEBEMAIL=[your-email-id]`

From inside the container

14. `docker run -v ~/debian-packaging/:/repo -it ubuntu-17.10-packaging bash`
15. `apt-get install devscripts`
16. `gpg --import pub.key`
17. `gpg --import secret.key`
18. `gpg -k`
19. `cd /repo/mariadb-10.1 && git fetch && git checkout pristine-tar && git checkout ubuntu-17.10`
20. `git clean -dffx && git reset --hard HEAD`
21. `export DEB_BUILD_OPTIONS="parallel=10 nocheck"` or `export DEB_BUILD_OPTIONS="parallel=5 nocheck"`
22. Go to `/repo` folder (Inside docker) and delete all the files except mariadb-10.1 folder:

`rm *`

23.

`gbp buildpackage`

For re-running the set up container

24. To generate an ID, run: `docker commit <container-id>` This will generate an ID.

For restarting the same container again use this ID: `docker run -v ~/debian-packaging/:/repo -it <ID> bash`

25. Last command for uploading package to PPA:

`backportpackage -u <your-ppa-address> -d <ubuntu-version-to-backport-to> -S ~<a-version-suffix-name-for-this-package> <the-most-recent-dsc-file>`

Example:

`backportpackage -u ppa:cvicentiu/mariadb-10.0-dev2 -d bionic -S ~testtry mariadb-10.1_10.1.30-0ubuntu0.17.10.1.dsc`

Run this command in the `/repo` folder, where the `.dsc` file is located
It should ask for the gpg key password again

- Docker tutorial available here:edit#slide=id.p4

Troubleshooting Overview

> **Note:**
>
> This page is focused on system-level development: It is geared toward developers or DBAs trying to diagnose why a specific instance is failing or crashing in a production or testing environment (e.g., interpreting error messages, handling crashes).

There are a number of ways MariaDB can result in a fault for you as the user. Getting a good clear understanding of the problem is the perfect way to get a good bug report to developers to allow them to fix your problem.

Like the MariaDB Community Bug Reporting says, start by searching for an existing bug. If its not found, or it not 100% clear that it applies to you, gain some additional information an include those in a new or perhaps and existing bug report.

This page is licensed: CC BY-SA / Gnu FDL

MariaDB Crashes

> **Note:**
>
> This page is focused on system-level development: It is geared toward developers or DBAs trying to diagnose why a specific instance is failing or crashing in a production or testing environment (e.g., interpreting error messages, handling crashes).

There are a number of causes of MariaDB crashes. Most of these are MariaDB encountering a situation where it cannot safely proceed. Crashes on Linux/Unix systems are fatal signals. On Windows these are similar looking exceptions.

InnoDB Semaphore wait

These are indicated by the following text in the error log:

```
[ERROR] [FATAL] InnoDB: Semaphore wait has lasted > 600 seconds. We intentionally crash the server
because it appears to be hung.
```

For this its essential that a full backtrace of [how-to-produce-a-full-stack-trace-for-mysqld/#getting-full-backtraces-for-all-threads-from-a-running-mariadbd-process|all the running threads].

Assertions

These look like `[ERROR] mariadbd got signal 6`. There might be associated text in the error log like:

```
InnoDB: Assertion failure in file ./storage/innobase/os/os0file.cc line 3540
InnoDB: Failing assertion: cb->m_err == DB_SUCCESS
```

On OSX it might show up as `Exception Type: EXC_CRASH (SIGABRT)`.

There maybe a stack trace, and perhaps a user SQL query (depending on the location). These are usually program errors that MariaDB got into a state where the developers did not expect to happen. Occasionally like the above, there are operating system factors that the developers haven't written handling routines for. In all cases this should be reported as a bug.

SEGV / Segment Violation

A SEGV, or Segment Violation, is an operating system concept in this case MariaDB accessing a location in memory it doesn't own. It will occur in the logs like:

`[ERROR] mysqld got signal 11 ;`

A full stack trace from the [how-to-produce-a-full-stack-trace-for-mysqld/#analyzing-a-core-file-with-gdb-on-linux|core file generated] is needed to resolve this form of error.

If there is a SQL query in the log file, include this in the bug report, along with `EXPLAIN query` and `SHOW CREATE TABLE tblname` for tables involved to enable a test case for this crash.

SIGBUS

This occurs when the alignment of memory doesn't correspond to the code accessing it.

`[ERROR] mysqld got signal 7`

Threat like SEGV.

SIGILL / Illegal Instruction

This indicates the MariaDB you have has been compiled for a CPU hardware feature that isn't available.

One cause is distributions occasionally target a minimum CPU version and if you are running on an earlier version it will crash in this way.

MariaDB does use optimizations in a number of critical paths under feature detection. Its possible that these aren't comprehensive for you your hardware. Very precise reporting of the hardware CPU model is required when reporting these bugs.

SIGKILL

This is an indicator that a user or OS killed of MariaDB. User invoked `SIGKILL` termination can be indirect using `podman kill {container}`.

The OS will kill MariaDB in an out of memory scenario in an attempt to regain memory. As MariaDB is a big memory user its usually fairly high on the list of processes killed by the OS.

If MariaDB is shutting down, it might be possible under some service manager that if it takes too long, it will get a SIGKILL. The default MariaDB systemd service has `SendSIGKILL=No`.

Galera SST scripts also have a `kill -9` in them.

Generally the SIGKILL won't be a bug, however the slow time that resulted in a service manager taking this drastic step might be.

Hardware faults

This can be disk corruption where MariaDB reads data and that data wasn't what was written. This will result in MariaDB doing unexpected things, including potentially accessing unallocated memory.

RAM corruptions can also result in undefined behaviour that is unfixable with software.

MariaDB Error Messages

> **Note:**
>
> This page is focused on system-level development: It is geared toward developers or DBAs trying to diagnose why a specific instance is failing or crashing in a production or testing environment (e.g., interpreting error messages, handling crashes).

MariaDB has a number of error messages. If the meaning is not clear, use the following table to guide you to the desired actions.

Can't lock aria control file, error 11

`[ERROR] mysqld: Can't lock aria control file '/var/lib/mysql/aria_log_control' for exclusive use, error: 11. Will retry for 30 seconds`

The `perror 11` is 'Resource temporarily unavailable'. This is an indication that an operating system lock couldn't be obtained on the ariia_log_control file. This is a strong indication that an existing MariaDB server is already running on the datadir.

Look at the operating system process list. Identify if the existing mysqld/mariadbd process is shutting down (look at the logs, and if its listening to new connections). MariaDB will stop accepting new SQL connections immediately once the shutdown starts.

If its shutting down, its best to let it continue. Force killing off the process will cause a crash recovery on the next restart. If you are about to upgrade there is a possibility your next upgraded version will not complete the crash recovery and you will need the current version to complete the log recovery.

If it completing the shutdown, take two [how-to-produce-a-full-stack-trace-for-mysqld/#getting-full-backtraces-for-all-threads-from-a-running-mariadbd-process|backtraces] with 30 seconds to a minute between them.

Can't create/write/read to file …. .. Errcode X

`[ERROR] mariadbd: Can't create/write to file '/var/run/mariadb/mariadb.pid' (Errcode: 2 "No such file or directory")`.

The errcode can be look up with `[perror](https://mariadb.com/docs/server/clients-and-utilities/perror) X` to return a text description of the code if not already there. In may cases there are directly the same as operating system errors. Common ones are:

- Error 2 - No such file or directory. MariaDB is expecting to read/write/create a file somewhere and it doesn't exist. If creating, the directory doesn't exist.
- Error 13 - EPERM, permission denied. Either file permissions or an access control mechanism like selinux or apparmor or systemd is preventing access to this location. Alternately you are running MariaDB as the incorrect user for the data it is trying to access.
- Error 28 - ENOSPC - no space left on device. The filesystem where writing is occurring is full and cannot fit any more data.

[ERROR] InnoDB: Invalid flags 0x4800 in ./ibdata1

This indicates that MariaDB is starting on a MySQL-8.0 data directory. Other flags are possible if a different page size or different features (see MDEV-27882).

MariaDB cannot startup on MySQL-8.0 data directory. MySQL should be run on the MySQL data directory and if the objective is to migrate, take logical dumps from MySQL before recreating a MariaDB database, perhaps in a different location, or after the MySQL data directory has been moved.

Debugging Memory Usage

> **Note:**
>
> This page is focused on system-level development: It is geared toward developers or DBAs trying to diagnose why a specific instance is failing or crashing in a production or testing environment (e.g., interpreting error messages, handling crashes).

Troubleshooting Memory Usage

This page describes how to debug MariaDB's memory usage. It uses CentOS 7 but can be applied to other systems as well.

Use Google PerfTools for debugging memory usage: heapprofile.html

On CentOS, install PerfTools like this:

```
sudo yum install gperftools
service mariadb stop
systemctl edit mariadb
```

In the editor that opens, add and save this content:

```
[Service]
Environment="HEAPPROFILE=/tmp/heap-prof-1"
Environment="HEAP_PROFILE_ALLOCATION_INTERVAL=10737418240"
Environment="HEAP_PROFILE_INUSE_INTERVAL=1073741824"
Environment="LD_PRELOAD=/usr/lib64/libtcmalloc.so.4"
```

Then run this command:

```
service mariadb start
```

Now, run the workload. When memory consumption becomes large enough, run this command:

```
ls -la /tmp/heap-prof-*
```

This should show several files. Copy the last file from the list:

```
cp /tmp/heap-prof-1.0007.heap .
```

Then, run this command:

```
pprof --dot /usr/sbin/mysqld heap-prof-1.0007.heap  > 7.dot
```

> **Note:**
>
> This produces a lot of lines, like `/bin/addr2line: Dwarf Error: ...`.

Then, please send us the `7.dot` file.

Memory Leak Overview

Operating system memory can be assigned, giving MariaDB a virtual address space, and allocated (paged in), once MariaDB starts to use this memory.

When looking at something that might be a memory leak, pay particular attention between the virtual size and the resident size.

When MariaDB has the same virtual size, but the resident size increases over time, this is a good indication that the memory buffers allocated to MariaDB are slowly being used. In this case its unlikely to be a memory leak.

Because memory leaks are hard to track down, documenting a known good version and a version that is leaking memory can make it easier to examine code changes in those versions against some other criteria like those obtained from the sections below to identify the cause.

Performance Schema

The memory instrumentation of the performance schema can be enable with the following:

```
performance_schema=on
performance-schema-instrument='memory/%=ON'
```

This is available since MariaDB 10.5.2. With this enabled, performance_schema.memory_summary_global_by_event_name can start to show where the memory leak is occurring.

Memleak

`memleak` is a BPF program for Linux that is frequently packaged like bcc-tools or similar (bpfcc-tools on Debian).

The upstream documentation provides this example.

The important aspect on measurement is to let MariaDB startup, and commence an normal workload before measurement. Starting too early or before the caches are populated is likely to result in false recording of memory allocations that will be eventually released.

Increasing the time interval of `memleak` is important to run longer than the usual query. If your memory is leaking over hours, then a high interval of 10 minutes so will reduce memory temporary allocated for a query. Recording for a longer time or multiple times should provide enough information to narrow down the location of the leak.

> **Note:**
>
> Very old Linux kernels like Centos/RHEL 7 might not have sufficient hooks to measure this correctly.

Compiling MariaDB for Debugging

> **Note:**
>
> This page is focused on lower-level development: It contains technical “how-to” documentation for engineers who are actually modifying the MariaDB source code (e.g., compiling for debug, using GDB, and memory leak detection in the code).

Compiling MariaDB for Debugging Using the `CMAKE_BUILD_TYPE` Option

This option enables multiple debug instrumentation aspects within the MariaDB server that provided more detailed information around complex parts of the server and can be used to implement and run tests where the concurrent execution of multiple threads must be controlled to achieve a specific state. If you are not doing this, the following option is sufficient.

Compiling MariaDB with full debug information includes all code symbols and also new code to do internal testing of structures and allow one to trace MariaDB execution. A full debug binary will be notably slower than a normal binary (30%). Most of this overhead can be removed by disabling `-DWITH_DBUG_TRACE=OFF`

You can configure build a debug build by executing `cmake` and by setting the `CMAKE_BUILD_TYPE` option to `Debug`. For example:

```
cmake -DCMAKE_BUILD_TYPE=Debug source_directory
```

To compile:

```
cmake --build .
```

You can find a list of the needed packages/libraries for building on Linux here.

Building Optimized Build With Debug Symbols

To build MariaDB with debug symbols, to get better stack traces and to be able to debug the binary with `gdb`, you need to supply the -Og and -g3 options to the `gcc` compiler for an debuggable, with limited optimization tradeoffs..

Pass these are options to cmake like:

```
cmake -DCMAKE_CXX_COMPILE_FLAGS='-Og -g3' -DCMAKE_C_COMPILE_FLAGS='-Og -g3' source_directory
```

To compile:

```
cmake --build .
```

Doing a Debug Build on Debian/Ubuntu

To build a “mariadbd” binary with debugging enabled that uses the same parameters as the ones used in Debian/Ubuntu binary packages, you must do as follows (you must have a deb-src line of one of the MariaDB repositories on your /etc/apt/sources.list in order to do that):

```
apt install build-essential devscripts fakeroot dpkg-dev
apt-get build-dep mariadb-server
apt-get source mariadb-server
cd mariadb-*
 DEB_CFLAGS_APPEND='-Og -g3' DEB_CXXFLAGS_APPEND='-Og -g3' debuild -us -uc
```

The packages created will have these flags set.

Temporarily Installing your Debug Build

The commands shown below replace the release `mariadbd` binary with the debug `mariadbd` binary that you compiled. Most importantly, they replace the binary in a way which makes it trivial to revert back to the original release `mariadbd` binary.

First, stop MariaDB.

Then, use the `mv` utility to rename the release `mariadbd` binary:

```
sudo mv /usr/sbin/mariadbd /usr/sbin/mariadbd-orig
```

Note: Do not use the `cp` utility because that will change the file modification timestamp.

Then, install the debug `mariadbd` binary from your source tree:

```
sudo install ~/mariadb-*/sql/mariadbd /usr/sbin/mariadbd
```

Then, start MariaDB.

Be sure to replace `/usr/sbin/mariadbd` with the path to your `mariadbdd` binary and to also replace `~/mariadb-*/sql/mariadbd` with the path to your debug #mariadbd `binary.`

Reinstalling your Release Build

If you want to restore your original `mariadbd` binary, you can do it with the following process::

First, stop MariaDB.

Then, execute the following command to delete the symbolic link:

```
sudo mv /usr/sbin/mariadbd /usr/sbin/mariadbd-debug
```

Then, execute the following command to move the original `mariadbd` release binary back into place:

```
sudo mv /usr/sbin/mariadbd-orig /usr/sbin/mariadbd
```

Then, start MariaDB.

Be sure to replace `/usr/sbin/mariadbd` with the path to your `mariadbd` binary

The debug `mariadb-debug` binary is still present if it is needed again in the future.

Different Compilation Options

Changing DBUG_ASSERT to Print to Error Log

A debug binary has lots of code checks and asserts, that are not checked in production. This is done to get more performance when running in production.
In some cases, when one is trying to find a hard-to-repeat bug, it could be beneficial to have these checks in production builds too.

Compiling with `-DDBUG_ASSERT_AS_PRINTF` will change DBUG_ASSERT() to print any failed check to the error log.

```
cmake . -DDBUG_ASSERT_AS_PRINTF
```

Enabling the above option should not have any notable impact on performance (probably < 1% slowdown).
This is achieved by grouping asserts in MariaDB server code into two groups:

- Fast checks, using `DBUG_ASSERT()`: These are converted to printing to error log.
- Slow checks, using `DBUG_SLOW_ASSERT()`. These will always be removed in production builds.

Creating a Trace File

> **Note:**
>
> This page is focused on lower-level development: It contains technical “how-to” documentation for engineers who are actually modifying the MariaDB source code (e.g., compiling for debug, using GDB, and memory leak detection in the code).

If `mysqld` is crashing, creating a trace file is a good way to find the issue.

A `mysqld` binary that has been compiled with debugging support can create trace files using the DBUG package created by Fred Fish. To find out if your `mysqld` binary has debugging support, run `mysqld -V` on the command line. If the version number ends in `-debug` then your `mysqld` binary was compiled with debugging support.

See Compiling MariaDB for debugging for instructions on how to create your own `mysqld` binary with debugging enabled.

To create the trace log, start `mysqld` like so:

```
mysqld --debug
```

Without options for –debug, the trace file will be named `/tmp/mysqld.trace` in MySQL and older versions of MariaDB before 10.5 and `/tmp/mariadbd.trace` starting from MariaDB 10.5.

On Windows, the debug `mysqld` is called `mysqld-debug` and you should also use the `--standalone` option. So the command on Windows will look like:

```
mysqld-debug --debug --standalone
```

Once the server is started, use the regular `mysql` command-line client (or another client) to connect and work with the server.

After you are finished debugging, stop the server with:

```
mysqladmin shutdown
```

DBUG Options

Trace files can grow to a significant size. You can reduce their size by telling the server to only log certain items.

The `--debug` flag can take extra options in the form of a colon (:) delimited string of options. Individual options can have comma-separated sub-options.

For example:

```
mysqld --debug=d,info,error,query:o,/tmp/mariadbd.trace
```

The '`d`' option limits the output to the named DBUG_ macros. In the above example, the `/tmp/mariadbd.trace` tracefile will contain output from the info, error, and query DBUG macros. A '`d`' by itself (with no sub-options) will select all DBUG_ macros.

The '`o`' option redirects the output to a file (`/tmp/mariadbd.trace` in the example above) and overwrites the file if it exists.

Debugging a Running Server (on Linux)

> **Note:**
>
> This page is focused on lower-level development: It contains technical "how-to" documentation for engineers who are actually modifying the MariaDB source code (e.g., compiling for debug, using GDB, and memory leak detection in the code).

Even if you don't have a server that is compiled for debugging, there are still ways to get more information out of it if things go wrong.

When things go wrong, it's always better to have a version of the mysqld daemon that is not stripped.

```
shell> file /usr/sbin/mysqld
```

If this doesn't say 'stripped', then you are fine. If not, you should either download a binary with debugging information or compile it, without stripping the binary.

Debugging Memory Consumption With tcmalloc

Read the Profiling Memory Usage page for more information on how to debug high memory consumption.

If you have a problem with a mysqld process that keeps on growing, you can use tcmalloc to find out what is allocating memory:

Depending on the system, you have to install the `tcmalloc` (openSUSE) or the `google-perftools-lib` (RedHat, CentOS) package.

The following set of commands starts mysqld with memory profiling, and if you kill it with SIGABRT, you will get a core dump that you can examine:

```
HEAPPROFILE=/tmp/mysqld.prof /usr/sbin/mysqld_safe --malloc-lib=tcmalloc --core-file-size=unlimited --
core-file
```

or if you prefer to invoke mysqld directly:

```
ulimit -c unlimited
LD_PRELOAD=/usr/lib64/libtcmalloc.so.4 HEAPPROFILE=/tmp/mysqld.prof /usr/sbin/mysqld --core-file
```

You can, of course, add other mysqld options to the end of the above line.

Now start your client/application that uses MariaDB. You can find where memory is allocated in the `/tmp/mysqld.prof` file. If you find any memory issues, please report them in the MariaDB bug tracker!

ptrace Protection and Attaching GDB to a mysqld Instance

New Ubuntu releases do not allow one process to examine the memory of an arbitrary user's process. As a result, when trying to attach GDB to a running
MariaDB (or any other process) instance, one gets the following error in GDB:

```
ptrace: Operation not permitted
```

More details are available in the Ubuntu Wiki.

To allow GDB to attach, one needs to edit the value of the `/proc/sys/kernel/yama/ptrace_scope` sysctl value.

- To change it temporarily, open a root shell and issue:

```
echo 0 > /proc/sys/kernel/yama/ptrace_scope
```

- To change it permanently, edit as root:

```
/etc/sysctl.d/10-ptrace.conf
```

and set the value to `0`.

Debugging a Server That Hangs

If your mysqld server hangs, you may want to debug it to know what happened.

Preferably, the server should be compiled for debugging, but it's not strictly necessary:

```
cmake -DCMAKE_BUILD_TYPE=Debug -DWITH_VALGRIND=ON .
make -j4
```

To know what the server is doing:

- Find out the process number of mysqld

```
ps -edalf | grep mysqld
```

- Attach to the process and get a back trace:

```
gdb -p 'pid of mysqld' path-to-mysqld
set height 0
set logging file /tmp/mysqld.log
set logging on
thread apply all backtrace full
```

After the above, you have a full backtrace, including all local variables, in the `mysqld.log` file. Note that you will only get all variables if the server is not stripped.

This page is licensed: CC BY-SA / Gnu FDL

Debugging MariaDB With a Debugger

> **Note:**
>
> This page is focused on lower-level development: It contains technical "how-to" documentation for engineers who are actually modifying the MariaDB source code (e.g., compiling for debug, using GDB, and memory leak detection in the code).

If you have MariaDB compiled for debugging you can both use it in a debugger, like ddd or gdb, and get comprehensive trace files of the execution of MariaDB. The trace files allow you to both see the flow of the code and to see the differences in execution by comparing two trace files.

Core dumps are also much easier to investigate if they come from a debug binary.

Note that a binary compiled for debugging and tracing is about 10-20% slower than a normal binary. If you just compile a binary for debugging (option `-g` with gcc) the speed difference compared to a normal binary is negligible.

Checking That MariaDB is Compiled For Debugging

Execute:

```
mariadbd --debug --help
```

If you are using MariaDB before 10.5, then you should use `mysqld` instead of `mariadbd`!

If you get an error `unknown option '--debug`, then MariaDB is not compiled for debugging and tracing.

Building MariaDB for Debugging Starting from 5.5

On Unix you need to pass `-DCMAKE_BUILD_TYPE=Debug` to cmake to compile with debug information.

Building MariaDB 5.3 and Older

Here is how you compile with debug on older versions:

Use the scripts in the BUILD directory that will compile MariaDB with most common debug options and plugins, for example:

```
./BUILD/compile-pentium64-debug-max
```

For the most common configurations there exists a fine-tuned script in the BUILD directory.

If you want to use valgrind, a very good memory instrumentation tool and memory overrun checker, you should use

```
./BUILD/compile-pentium64-valgrind-max
```

Some recommended debugging scripts for Intel/AMD are:

```
BUILD/compile-pentium64-debug-max
BUILD/compile-pentium64-valgrind-max
```

This is an example of how to compile MariaDB for debugging in your home directory with MariaDB 5.2.9 as an example:

```
cd ~
mkdir mariadb
cd mariadb
tar xvf mariadb-5.2.9.tar.gz
ln -s mariadb-5.2.9 current
cd current
./BUILD/compile-pentium64-debug-max
```

The last command will produce a debug version of `sql/mysqld`.

Debugging MariaDB From the Source Directory

Creating the MariaDB Database Directory

The following example creates the MariaDB databases in `/data`.

```
./scripts/mariadb-install-db --srcdir=. --datadir=/data
```

Running MariaDB in a Debugger

The following example is using `ddd`, an excellent graphical debugger in Linux. If you don't have `ddd` installed, you can use `gdb` instead.

```
cd sql
ddd ./mariadbd &
```

In `ddd` or `gdb`

```
run --datadir=/data --language=./share/english --gdb
```

You can set the options in your /.my.cnf file so as not to have to repeat them on the `run` line.

If you run `mysqld` with `--debug`, you will get a trace file in /tmp/mysqld.trace that shows what is happening.

Note that you can have different options in the configuration file for each MariaDB version (like having a specific language directory).

Debugging MariaDB Server with mariadb-test-run

If you get a crash while running `mariadb-test-run` you can debug this in a debugger by using one of the following options:

```
mariadb-test-run --gdb failing-test-name
```

or if you prefer the `ddd` debugger:

```
mariadb-test-run --ddd failing-test-name
```

Sample .my.cnf file to Make Debugging Easier

```
[client-server]
socket=/tmp/mysql-dbug.sock
port=3307

[mariadb]
datadir=/my/data
loose-innodb_file_per_table
server_id= 1
log-basename=master
loose-debug-mutex-deadlock-detector
max-connections=20
lc-messages=en_us

[mariadb-10.0]
lc-messages-dir=/my/maria-10.0/sql/share

[mariadb-10.1]
lc-messages-dir=/my/maria-10.1/sql/share

[mariadb-10.2]
lc-messages-dir=/my/maria-10.2/sql/share

[mariadb-10.3]
lc-messages-dir=/my/maria-10.3/sql/share
```

The above `.my.cnf` file:

- Uses an explicit socket for both client and server.
- Assumes the server source is in /my/maria-xxx. You should change this to point to where your sources are located.
- Has a unique patch for each MariaDB version so that one doesn't have to specify –lc-messages-dir or –language even if one switches between debugging different MariaDB versions.

Enabling Core Dumps

> **Note:**
>
> This page is focused on lower-level development: It contains technical "how-to" documentation for engineers who are actually modifying the MariaDB source code (e.g., compiling for debug, using GDB, and memory leak detection in the code).

Enabling in an Option File

Core dumps are enabled by default on **Windows**, so **this step can be skipped on Windows** in those versions. See MDEV-18439 for more information.

In order to enable core dumps, you need to set the core_file system variable either on the command-line or in a relevant server option group in an option file. For example:

```
[mariadb]
...
core_file
```

You can check your current value by executing:

```
my_print_defaults --mariadbd
```

core_file is a system variable. Its value can be checked at runtime by executing the following:

```
SHOW GLOBAL VARIABLES LIKE 'core_file';
```

Core Files on Linux

There are some additional details related to using core files on Linux.

Disabling Core File Size Restrictions on Linux

On some systems there is a limit on the sizes of core files that can be dumped. You can check the system's current system-wide limit by executing the following:

```
ulimit -c
```

You can check the current limit of the `mariadbd` process specifically by executing the following:

```
sudo cat /proc/$(pidof mariadbd)/limits | grep "core file"
```

If you need to change the core size limit, the method you use depends on how you start `mariadbd`. See the sections below for more details.

The resource limits for the `mariadbd` process are printed to the error log when the `mariadbd` process crashes. That way, users can confirm whether the process may have been allowed to dump a core file. See MDEV-15051 for more information.

Running mariadbd Using mysqld_safe

If you are starting MariaDB by running mysqld_safe, then configuring the following in the `[mysqld_safe]` option group in an option file should allow for unlimited sized core files:

```
[mysqld_safe]
...
core_file_size=unlimited
```

You can check your current values by executing:

```
my_print_defaults mysqld_safe
```

See mysqld_safe: Configuring the Core File Size for more details.

Note: If you are using mysqld_safe and running `mariadbd` as the `root` user, then no core file is created on some systems. The solution is to run `mariadbd` as another user.

Running mariadbd Manually

If you are starting mariadbd manually or in a custom script, then you can allow for unlimited sized core files by executing the following in the same shell or script in which mariadbd is executed:

```
ulimit -c unlimited
```

Running mariadbd Using systemd

If you are starting `mariadbd` using systemd, then you may need to customize the MariaDB service to allow for unlimited size core files. For example, you could execute the following:

Using `sudo systemctl edit mariadb.service` add the contents:

```
[Service]

LimitCORE=infinity
```

See systemd: Configuring the Core File Size for more details.

Running MariaDB Containers

To get a core dump in a `mariadb` container requires setting the path on Linux to not include a `sysctl kernel.core_pattern` beginning with a pipe to an executable that doesn't exist in the container. Setting to a straight `core` is recommended.

Also see Container with Debug Symbols.

Changing the System-Wide Limit

If you want to change the system-wide limit to allow for unlimited size core files for the `mysql` user account, then you can do so by adding the following lines to a file in /etc/security/limits.d/. For example:

```
sudo tee /etc/security/limits.d/mariadb_core.conf <<EOF
mysql soft core unlimited
mysql hard core unlimited
EOF
```

The system would have to be restarted for this change to take effect.

See Configuring Linux for MariaDB: Configuring the Core File Size for more details.

Setting the Path on Linux

If you are using Linux, then it can be helpful to change a few settings to alter where the core files is written and what file name is used. This is done by setting the `kernel.core_pattern` and `kernel.core_uses_pid` attributes. You can check the current values by executing the following:

```
sysctl kernel.core_pattern
sysctl kernel.core_uses_pid
```

If you are using `mysql-test-run` and want to have the core as part of the test result, the optimal setting is probably the following (store cores in the current directory as `core.number-of-process-id`):

```
sudo sysctl kernel.core_pattern=core.%p kernel.core_uses_pid=0
```

If you are using a production system, you probably want to have the core files in a specific directory, not in the data directory. They place to store cores can be temporarily altered using the sysctl utility, but it is often more common to alter them via the /proc file system. See the following example:

```
sudo mkdir /tmp/corefiles
sudo chmod 777 /tmp/corefiles
sudo sysctl kernel.core_pattern=/tmp/corefiles/core
sudo sysctl kernel.core_uses_pid=1
```

The above commands will tell the system to put core files in `/tmp/corefiles`, and it also tells the system to put the process ID in the file name.

If you want to make these changes permanent, then you can add the following to a file in /etc/sysctl.conf.d/. For example:

```
sudo tee /etc/sysctl.d/mariadb_core.conf <<EOF
kernel.core_pattern=/tmp/corefiles/core
kernel.core_uses_pid=1
EOF
```

Note: if you are using containers, the pid is always going to be 1, so this may not be a useful setting. Appending an identifier like %t to the kernel.core_pattern will generate more unique files.

The value of `kernel.core_pattern` is printed to the error log when the `mariadbd` process crashes. That way, users can determine where the process may have dumped a core file. See MDEV-15051 for more information.

Note: Ensure that you have enough free disk space in the path pointed to by `kernel.core_pattern`.

Extracting Linux core dumps with systemd-coredump

Core dump management can be automated using systemd, which then centrally manages all core dump files and provides information about detected core dumps and access to collected core files using the coredumpctl utility.

This is enabled per default on Red Hat Enterprise Linux 8 and CentOS 8, and maybe other contemporary Linux distribution releases by now, too. It can be easily checked for by looking at the `kernel.core_pattern setting`. If it looks like this systemd-coredump is enabled:

```
# sysctl kernel.core_pattern
kernel.core_pattern = |/usr/lib/systemd/systemd-coredump %P %u %g %s %t %c %h %e
```

On other distributions like Ubuntu (at least up to 21.10) it is not enabled by default, but can be set up manually.

To see all recent core dumps on the system you can then simply run

```
# coredumpctl list
```

Or you can check for MariaDB Server core dumps specifically with:

```
# coredumpctl list /usr/sbin/mariadbd
```

If an actual core file got stored you'll see `present` in the COREFILE column of the output, you can then extract the core file with:

```
# coredumpctl dump -o mariadbd.core ...PID...
```

using the process id number from the PID column, or when you just want to retrieve the latest MariaDB Server related entry:

```
# coredumpctl dump -o mariadb.core /usr/sbin/mariadbd
```

Starting with `systemd` 248 it is also possible to invoke the `gdb` debugger directly using the new `--debugger-arguments=...` option, e.g. making the extraction of all thread backtraces from the most recent MariaDB server crash a one liner without even having to extract the core dump file first (requires `gdb` to be installed):

```
# coredumpctl debug --debugger-arguments="-batch -ex 'thread apply all bt full'" /usr/sbin/mariadbd
```

So far none of the long term support Linux distribution releases have a new enough `systemd` version for this, the (as of this writing) still upcoming Ubuntu 22.04 "Jammy Jellyfish" will probably the first to support this.

Core Dumps and setuid on Linux

Since `mariadbd` executes setuid, you may have to set `fs.suid_dumpable=2` to allow core dumps on Linux. You can check the current `fs.suid_dumpable` value by using the sysctl utility. For example:

```
sysctl fs.suid_dumpable
```

You can temporarily set it to `2` by using the sysctl utility. For example:

```
sudo sysctl -w fs.suid_dumpable=2
```

Or you can temporarily set it to `2` by writing to the /proc file system. For example:

```
sudo echo 2 > /proc/sys/fs/suid_dumpable
```

If you want to permanently set it to `2` then you can add the following to a file in /etc/sysctl.conf.d/:

```
sudo tee /etc/sysctl.d/mariadb_fs_suid_dumpable.conf <<EOF
fs.suid_dumpable=2
EOF
```

Note: If you don't want to change `fs.suid_dumpable`, then another solution is to start `mariadbd` directly as the `mysql` user, so that the setuid call is not needed.

Forcing a Core File on Linux

You can get a core dump from a running server with:

```
sudo gcore -o filename $(pidof mariadbd)
```

This will store a core dump in `filename.pid` where pid is the process ID of `mariadbd`. `mariadbd` will continue to be running and will not be affected by `gcore`.

Another method is to force a core file for `mariadbd` by sending the process the `sigabrt` signal, which has the signal code `6`. This is very useful to get the state of the unresponsive `mariadbd` process. However, this will cause `mariadbd` to crash, and crash recovery will be run on restart.

You can send the signal with the kill command. For example:

```
sudo kill -6 $(pidof mariadbd)
```

As an alternative to `$(pidof mariadbd)`, you can find the process ID either by using the ps utility or by checking the file defined by the pid_file system variable.

Core Files on Windows

Core dumps are enabled by default on Windows. See MDEV-18439 for more information.

There are some additional details related to using core files on Windows.

Minidump Files on Windows

On Windows, the core file is created as a minidump file.

For details on how to configure and read the minidump file, see How to read the small memory dump file that is created by Windows if a crash occurs.

Core Files on Kubernetes

See the IBM Core Dump Handler project.

Core Files and Address Sanitizer (ASAN)

If your `mariadbd` binary is built with Address Sanitizer (ASAN) then it will disable core dumps by default. A core dump can be created if `mariadbd` is started with the environment variable `ASAN_OPTIONS` set with `disable_coredump=0`.

What's Included in Core Files

Core files usually contain a dump of all memory in the process's full address space. This means that if a server has some large buffers configured (such as a large InnoDB buffer pool), then the server's core files can get very large.

Some large buffers have been excluded from core files on some systems as a way to reduce the size.

The following buffers are excluded:

- InnoDB buffer pool
- InnoDB log buffer
- InnoDB Redo log buffer (fixed 2M)
- Query cache

The buffers are only excluded on Linux when using kernel version 3.4 and above and when using a non-debug build of `mariadbd`. Some Linux kernel versions have a bug which would cause the following warning to be printed to the log:

```
Sep 25 10:41:19 srv1 mysqld: 2018-09-25 10:41:19 0 [Warning] InnoDB: Failed to set memory to DODUMP:
Invalid argument ptr 0x2aaac3400000 size 33554432
```

In those cases, the core dump may exclude some additional data. If that is not a concern, then the warning can be ignored. The problem can be fixed by upgrading to a Linux kernel version in which the bug is fixed.

Producing a Full Stack Trace for mariadbd

> **Note:**
>
> This page is focused on lower-level development: It contains technical "how-to" documentation for engineers who are actually modifying the MariaDB source code (e.g., compiling for debug, using GDB, and memory leak detection in the code).

Partial Stack Traces in the Error Log

When `mariadbd` crashes, it will write a stack trace in the error log by default. This is because the stack_trace option defaults to `ON`. With a normal release build, this stack trace in the error log may look something like this:

```
2019-03-28 23:31:08 0x7ff4dc62d700  InnoDB: Assertion failure in file
/home/buildbot/buildbot/build/mariadb-10.2.23/storage/innobase/rem/rem0rec.cc line 574
InnoDB: We intentionally generate a memory trap.
InnoDB: Submit a detailed bug report to https://jira.mariadb.org/
InnoDB: If you get repeated assertion failures or crashes, even
InnoDB: immediately after the mysqld startup, there may be
InnoDB: corruption in the InnoDB tablespace. Please refer to
InnoDB: https://mariadb.com/kb/en/library/innodb-recovery-modes/
InnoDB: about forcing recovery.
190328 23:31:08 [ERROR] mysqld got signal 6 ;
This could be because you hit a bug. It is also possible that this binary
or one of the libraries it was linked against is corrupt, improperly built,
or misconfigured. This error can also be caused by malfunctioning hardware.

To report this bug, see https://mariadb.com/kb/en/reporting-bugs

We will try our best to scrape up some info that will hopefully help
diagnose the problem, but since we have already crashed,
something is definitely wrong and this may fail.

Server version: 10.2.23-MariaDB-10.2.23+maria~stretch
key_buffer_size=134217728
read_buffer_size=131072
max_used_connections=234
max_threads=752
thread_count=273
It is possible that mysqld could use up to
key_buffer_size + (read_buffer_size + sort_buffer_size)*max_threads = 1783435 K  bytes of memory
Hope that's ok; if not, decrease some variables in the equation.

Thread pointer: 0x7ff4d8001f28
Attempting backtrace. You can use the following information to find out
where mysqld died. If you see no messages after this, something went
terribly wrong...

If you plan to report a bug about the problem, then this information can be very useful for MariaDB's developers to track down the root cause. However, notice that some of the function names in the call stack are missing. In some cases, this partial stack trace may not be enough to find out exactly where the problem is.

A full stack trace can only be produced if you have debugging symbols for your `mariadbd` binary.

Obtaining Debugging Symbols for Your mariadbd executable

Debug information is used by debugging tools to produce a meaningful stack trace. Importantly these packages do not replace any executables or any existing production executables or in any way interfere with the way the production server ran before these packages where installed.

If you are obtaining a backtrace for a coredump, you can move the core dump to a difference server that has the identical mariadb-server and debug info packages, and perform the backtrace there with no loss of information.

Installing Debug Info Packages on Linux

On some Linux distributions, you may be able to install `debuginfo` packages that contain debugging symbols.

Currently, `debuginfo` packages may not allow the server to print a nice stack trace in the error log. They also allow users to extract full stack traces from core dumps. See MDEV-20738 for more information.

Installing Debug Info Packages with yum/dnf

The MariaDB `yum` repository contains debuginfo packages.

On RHEL, CentOS, Fedora, and other similar Linux distributions, it is highly recommended to install the relevant RPM package from MariaDB's repository using yum or dnf. Starting with RHEL 8 and Fedora 22, `yum` has been replaced by `dnf`, which is the next major version of `yum`. However, `yum` commands still work on many systems that use `dnf`. For example:

```
sudo yum install MariaDB-server-debuginfo
```

See Installing MariaDB with yum/dnf: Installing Debug Info Packages with YUM for more information.

Installing Debug Info Packages with zypper

The MariaDB `zypper` repository contains debuginfo packages.

On SLES, OpenSUSE, and other similar Linux distributions, it is highly recommended to install the relevant RPM package from MariaDB's repository using zypper. For example:

```
sudo zypper install MariaDB-server-debuginfo
```

See Installing MariaDB with zypper: Installing Debug Info Packages with ZYpp for more information.

Installing Debug Info Packages from MariaDB's Debian or Ubuntu repository

These are for when you already installed MariaDB from a MariaDB mirror.

For Ubuntu an additional repository step is needed:

```
sudo add-apt-repository 'deb [arch=amd64,arm64,ppc64el,s390x]
https://ftp.osuosl.org/pub/mariadb/repo/10.5/ubuntu focal main/debug'
```

Adjust `10.5` to the major version you are debugging and `focal` to the required distribution.

```
apt-get update && apt-get install -y mariadb-server-core-10.5-dbgsym
```

From MariaDB 10.9 the version isn't included in the package name and `mariadb-server-core-dbgsym` can be used as the package name.

Installing Debug Info Packages packaged by Ubuntu or Debian

If you used the MariaDB versions provided by Debian or Ubuntu see the following links.

For Debian see AutomaticDebugPackages

For Ubuntu see Debug%20Symbol%20Packages

Installing Debugging Symbols on Windows

Debugging symbols are available to install on Windows.

Installing Debugging Symbols with the MSI Installer on Windows

Debugging symbols can be installed with the MSI installer. Debugging symbols are not installed by default. You must perform a custom installation and explicitly choose to install debugging symbols.

The MSI installer can be downloaded from the MariaDB downloads page.

Installing Debugging Symbols with the ZIP Package on Windows

MariaDB also provides a ZIP package that contains debugging symbols on Windows.

The ZIP package that contains debugging symbol can be downloaded from the MariaDB downloads page.

Containers with Debug Symbols

Prebuilt Debug Containers

These are currently only per major release version and are generated out of CI. They are always the latest version in the main branch on GitHub.

There are available on at mariadb-debug?tab=tags.

Use the container name `quay.io/mariadb-foundation/mariadb-debug:VERSION`.

Where `VERSION` corresponds to the major version you wish to test with.

Creating a Container with Debugging Symbols

Build using a Containerfile/Dockerfile:

```
ARG VERSION=10.11
FROM mariadb:$VERSION

RUN apt-get update \
        && apt-get install -y gdb mariadb-server-core-dbgsym=$(dpkg -s mariadb-server-core |  awk
'/Version/{print $NF}') ; \
        rm -rf /var/lib/apt/lists/*
```

Build with:

```
buildah bud --tag mariadb_debug --build-arg VERSION=10.11.6 -f Containerfile .
```

Then you will have a `mariadb_debug` container.

Example use:

```
podman run --entrypoint gdb --user mysql --volume mariadb_data:/var/lib/mysql mariadb_debug -ex r --args
/usr/sbin/mariadbd
```

Enabling Core Dumps

To enable core dumps, see Enabling Core Dumps for details.

Where is the Core File on Linux?

At the bottom of the error log there will be some text about the core location including:

```
Writing a core file...
Working directory at /var/lib/mariadb
Resource Limits:
Limit                     Soft Limit           Hard Limit           Units
...
Max core file size        unlimited            unlimited            bytes
...
Core pattern: |/usr/lib/systemd/systemd-coredump %P %u %g %s %t %c %h

Kernel version: Linux version 6.0.0-0.rc2.19.fc38.x86_64 (mockbuild@bkernel01.iad2.fedoraproject.org)
(gcc (GCC) 12.2.1 20220819 (Red Hat 12.2.1-1), GNU ld version 2.39-2.fc38) #1 SMP PREEMPT_DYNAMIC Mon Aug
22 12:52:40 UTC 2022
```

If the was a core limit in the resource limits there may be limited or no core file information.

If the core pattern begins with a **|**, then the following is the executable that handled the core file during the crash. The following show a few techniques to access the core depending on the pattern. If another program is used, look at its manual page to see how to get access to the core file.

If a plain core filename is in the “Core pattern” there’s a good chance it will be in the Working directory location. It might have a `.{process number}` suffix on the filename.

Extracting a core file from a container

If you are running MariaDB in a container, the locations where the core dump can be generated are limited. Looking at the container log, this will likely be where the error log information is. The “Core pattern” of a Linux system is currently a global fixed value. The consequence is if this core pattern refers to a program, that program isn’t likely to be in the container and won’t be executed on the crash.

The system wide crash handler can be changed with `sysctl kernel.core_pattern=core` to set this back to a file based crash. With this, the crash should occur in the working directory, normally the `/var/lib/mysql` data directory of the container volume.

Extracting a core file from systemd-coredump

For `systemd-coredump`, there is a program `coredumpctl` to manage access.

```
coredumpctl list
TIME                            PID   UID   GID SIG     COREFILE EXE
>
Fri 2022-09-09 14:16:37 AEST 213571  1000  1000 SIGSEGV present  /usr/sbin/mariadbd
```

To access the program using `gdb`, `coredumpctl debug` (defaults to last crash), will load the core dump in gdb. The instructions in the next section for extracting information.

See also: extracting core dumps with systemd-coredump.

Extract a core file from abrt

A core pattern of `|/usr/libexec/abrt-hook-ccpp` indicates `abrt` system is used.

abrt-cli is a command line user interface for access the core file.

Extract a core file from apport

A core pattern of `[|/usr/share/apport/apport` indicates `apport`.

For more information see Apport Project Wiki.

apport-retrace allows you to “Examine Locally” and run a `gdb` session. One you have gdb started instructions in the next section can be used for extracting information.

Analyzing a Core File with `gdb` on Linux

To analyze the core file on Linux, you can use gdb.

For example, to open a core file with gdb, you could execute the following:

```
sudo gdb /usr/sbin/mariadbd  /var/lib/mysql/core.932
```

Be sure to replace `/usr/sbin/mariadbd` with the path to your `mariadbd` binary (might be `mysqld` on MariaDB 10.4 and earlier) and to also replace `/var/lib/mysql/core.932` with the path to your core file.

Once gdb has opened the core file, if you want to log all output to a file, then you could execute the following commands:

```
set logging file /tmp/gdb_output.log
set logging on
```

If you do not execute `set logging file`, then the `set logging on` command creates a `gdb.txt` in your current working directory. Redirecting the output to a file is useful, because it can make it easier to analyze. It also makes it easier to send the information to a MariaDB developer, if that becomes necessary.

Do any commands that you would like to do. For example, you could get the backtraces.

Once you are done, you can exit gdb by executing the quit command.

Getting Backtraces with `gdb` on Linux

On Linux, once you have debugging symbols for your `mariadbd` binary, you can use the gdb utility to get backtraces, which are what `gdb` calls stack traces. Backtraces can be obtained from a core file or from a running `mariadbd` process.

Full backtraces are preferred and will contain function arguments, which can contain useful information such as query strings, so it can make the information easier to analyze.

To get a **full** backtrace of the main thread, then you could execute the following:

```
bt -frame-arguments all full
```

If you want to get a **full** backtrace of **all** threads, then you could execute the following:

```
thread apply all bt -frame-arguments all full
```

If you want to get a full backtrace to a file to report a bug, the recommended way is to use gdb:

```
set logging on
set pagination off
set print frame-arguments all
thread apply all bt full
set logging off
```

This will write the full backtrace into the file `gdb.txt`.

Getting Full Backtraces For All Threads From a Core File

Sometimes it can be helpful to get **full** backtraces for all threads. The full backtraces will contain function arguments, which can contain useful information such as query strings, so it can make the information easier to analyze.

To get **full** backtraces for all threads from a `mariadbd` core file, execute a command like the following:

```
sudo gdb --batch --eval-command="set print frame-arguments all" --eval-command="thread apply all bt full"
/usr/sbin/mariadbd /var/lib/mysql/core.932  > mariadbd_full_bt_all_threads.txt
```

Be sure to replace `/usr/sbin/mariadbd` with the path to your `mariadbd` binary and to also replace `/var/lib/mysql/core.932` with the path to your core dump.

The backtraces will be output to the file `mariadbd_full_bt_all_threads.txt`.

Getting Full Backtraces For All Threads From a Running `mariadbd` Process

Sometimes it can be helpful to get **full** backtraces for all threads. The full backtraces will contain function arguments, which can contain useful information such as query strings, so it can make the information easier to analyze.

To get **full** backtraces for all threads from a running `mariadbd` process, execute a command like the following:

```
sudo gdb --batch --eval-command="set print frame-arguments all"  --eval-command="thread apply all bt
full" /usr/sbin/mariadbd $(pgrep -xn mariadbd)  > mariadbd_full_bt_all_threads.txt
```

Be sure to replace `/usr/sbin/mariadbd` with the path to your `mariadbd` binary.

The backtraces will be output to the file `mariadbd_full_bt_all_threads.txt`.

Sometimes very busy systems are too busy to batch obtain the backtrace. If this is the case, `gcore $(pidof mariadbd)` can save the core and then obtain the backtrace out of the dumped core.

Getting a Full Backtrace out of a Container

If the crash or assertion is repeatable it could be easiest to run `mariadbd` under #gdb `.`

The container image name here can be a prebuilt one from `quay.io/mariadb-foundation/mariadb-debug` or an explicit version built yourself as above.

```
docker run -v datavolume:/var/lib/mysql/ --rm --user mysql  quay.io/mariadb-foundation/mariadb-
debug:10.11 gdb -ex r  -ex 'thread apply all bt -frame-arguments all full'  --args mariadbd
```

In docker-compose.yml form this looks like:

```
services:
  mariadb:
    image: quay.io/mariadb-foundation/mariadb-debug:10.11
    volumes:
      - mariadbdata:/var/lib/mysql
    environment:
      - MARIADB_ROOT_PASSWORD=bob
    command: gdb -ex r  -ex 'thread apply all bt -frame-arguments all full'  --args mariadbd
    user: mysql
volumes:
  mariadbdata: {}
```

Note, the initialization of data is assumed. Omit `command` and `user` if it isn't.

If you wish to attach to and existing process in a container, the container needs to be started with the SYS_PTRACE capability. The sysctl `kernel.yama.ptrace_scope` that allows this should also be set to 0.

```
$ podman run -v data:/var/lib/mysql/ --cap-add SYS_PTRACE --name mtest -d quay.io/mariadb-
foundation/mariadb-debug:11.2
$ podman exec --user mysql mtest gdb -p 1 -ex  'thread apply all bt -frame-arguments all full'
```

Note: `podman` has the same arguments and behaviour as `docker` if you'd rather use that.

or in compose:

```
cap_add:
    - SYS_PTRACE
```

The container process is always pid one, and here we use `c` then `thread apply all bt -frame-arguments all full` as the pre-loaded `gdb` commands. When a particular signal like assert or SEGV is triggered, the backtrace will be displayed.

Letting a Container coredump

First, the `sysctl kernel.core_pattern` needs to be `core`. If it starts with a pipe character it try to execute this within the container. This is a kernel wide setting and cannot be applied to a specific container. The bottom of a crash will show you want it is set to.

With this set, just running a container with debug info is sufficient. The core should be dumped on the datadir volume. With the `core` dump here, analysis can occur like:

```
podman run --rm --user mysql --volume data:/var/lib/mysql -i mariadb_debug gdb --batch --eval-
command="set print frame-arguments all" --eval-command="thread apply all bt full" /usr/sbin/mariadbd
/var/lib/mysql/core | tee mariadbd_full_bt_all_threads.txt
```

Running a Copy of the Database Directory

If you are concerned with debuggers running on your production database you can also copy the database to another location.

This is useful when you know which statement crashed the server.

Just start mariadbd with the options `--datadir=/copy-of-original-data-directory --core-file --stack-trace --socket=/tmp/mariadbd-alone.sock --skip-networking`

Disabling Stack Traces in the Error Log

In order to disable stack traces in the error log, you can configure the skip_stack_trace option either on the command-line or in a relevant server option group in an option file. For example:

```
[mariadb]
...
skip_stack_trace
```

Reporting the Problem

If you encounter some problem in MariaDB, then MariaDB's developers would appreciate if you would report a bug at the MariaDB JIRA bug tracker. Please include the following information:

- Your full stack trace.
- Your error log.
- Your option files.

- How to reproduce the problem.
- SHOW ENGINE INNODB STATUS
- SHOW CREATE TABLE {table (for each table in query) and EXPLAIN {query} if a query related crash.

A MariaDB FTP server is available for large and/or sensitive information. Please upload in `.tar.gz` or `.zip` archive.

For very difficult or critical errors, you should consider uploading the following information to the MariaDB FTP server the following:

- Your build of `mariadbd` (if you compiled it), otherwise version information on the mariadb-server package.
- Your core file.
- Your contact information.
- The associated JIRA issue identifier for the bug, if you reported a bug.

This information will allow MariaDB developers to analyze it and try to create a fix.

Using procmon to Trace mysqld.exe Filesystem Access

> **Note:**
>
> This page is focused on lower-level development: It contains technical “how-to” documentation for engineers who are actually modifying the MariaDB source code (e.g., compiling for debug, using GDB, and memory leak detection in the code).

This article provides a walkthrough on using the Process Monitor on Windows, tracing file system access by mysqld.exe during the “install plugin” call.

Download

Process Monitor is an advanced monitoring tool for Windows that shows real-time file system, registry and process/thread activity. It is a part of sysinternals suite developed by Mark Russinovich and Bryce Cogswell. Process Monitor can be directly downloaded from ProcessMonitor.zip . More description can be found at https://learn.microsoft.com/en-us/sysinternals/downloads/procmon

Installation

There is no installation necessary; the single executable can be used after unpacking. I suggest putting procmon into some directory in the PATH environment variable.

Example of taking a mysqld.exe trace

The purpose of the following exercise is to learn how to use procmon to trace mysqld.exe calls to the filesystem.

We assume that mysqld.exe is already started.

1. Start procmon.exe . Dialog will pop up that offers to set filter. Use this dialog to set filter to “Process name” “is” “mysqld.exe”, as shown in the screenshot below.

Click on “Add” button to mysqld.exe to include it in the filter, “Apply” and “OK”.

2. Capture events (Menu File=>Capture Events (Ctrl+E)
3. Start mysql command line client and connect to the server.
   Execute

```
mysql> install plugin blackhole soname 'ha_blackhole.dll';
Query OK, 0 rows affected (0.03 sec)
```

4. Saving the trace

Back to Process Monitor Windows, you should see the filesystem events initiated by the “INSTALL PLUGIN” operation

To save it, choose File/Save.

(Advanced) Seeing stack traces corresponding to events

It is also possible to see stacktraces corresponding to the events. For this to work, symbols support needs to be configured. This needs to be only done once.

1. Install Debugging Tools for Windows (google on how to do that).
2. Switch to Process Monitor’s menu Options => Configure symbols.
3. Add dbghelp.dll from your installation of Debugging Tools into “dbghelp.dll path” input field . On my system it is C:\Program Files\Debugging Tools for Windows (x64)\dbghelp.dll
4. In “symbol path” input field, add `srv*C:\symbols*https://msdl.microsoft.com/download/symbols;<path\to\your\installation\bin>` (substitute last path element with real path to your installation)

This is how it looks on my machine:

Once symbols are configured, you’ll get a stack trace corresponding to a filesystem event by simply doubleclicking on the line corresponding to the event. This is what I see after clicking on the first event of my tracing session (corresponds to opening my.ini file)

It is also possible to save the whole trace with callstacks as text (File/Save, choose XML, include callstack + resolve callstack).

Limitations/Differences with a MariaDB Server Compiled for Debugging

> **Note:**
>
> This page is focused on lower-level development: It contains technical “how-to” documentation for engineers who are actually modifying the MariaDB source code (e.g., compiling for debug, using GDB, and memory leak detection in the code).

A MariaDB server configured with `--with-debug=full` has the following differences from a normal MariaDB server:

- You can have maximum of 1000 tables locked at the same time in one statement. (Define `MAX_LOCKS` in mysys/thrlock.c). This is to detect loops in the used lists.
- You can have maximum of 1000 threads locking the same table. (Define `MAX_THREADS` in mysys/thrlock.c). This is to detect loops in the used lists.
- Deadlock detection of mutex will be done at runtime. If wrong mutex handling is found an error will be printed to the error log. (Define `SAFE_MUTEX`)
- Memory overrun/underrun and not freed memory will be reported to the error log (Define `SAFEMALLOC`)
- You can get a trace of what `mysqld` (and most other binaries) is doing by starting it with the `--debug` option. The trace is usually put in `/tmp` or `C:\`

Writing Plugins for MariaDB

> **Note:**
>
> This page contains background information for MariaDB developers.

About

Generally speaking, writing plugins for MariaDB is very similar to writing plugins for MySQL.

Authentication Plugins

See Pluggable Authentication.

Storage Engine Plugins

Storage engines can extend `CREATE TABLE` syntax with optional index, field, and table attribute clauses. See Extending CREATE TABLE for more information. See also Storage Engine Development.

Information Schema Plugins

Information Schema plugins can have their own FLUSH and SHOW statements. See FLUSH and SHOW for Information Schema plugins.

Encryption Plugins

Encryption plugins in MariaDB are used for the data at rest encryption feature. They are responsible for both key management and for the actual encryption and decryption of data.

Function Plugins

Function plugins add new SQL functions to MariaDB. Unlike the old UDF API, function plugins can do almost anything that a built-function can.

Plugin Declaration Structure

The MariaDB plugin declaration differs from the MySQL plugin declaration in the following ways:

1. it has no useless 'reserved' field (the very last field in the MySQL plugin declaration)
2. it has a 'maturity' declaration
3. it has a field for a text representation of the version field

MariaDB can load plugins that only have the MySQL plugin declaration but both `PLUGIN_MATURITY` and `PLUGIN_AUTH_VERSION` will show up as 'Unknown' in the INFORMATION_SCHEMA.PLUGINS table.

For compiled-in (not dynamically loaded) plugins, the presence of the MariaDB plugin declaration is mandatory.

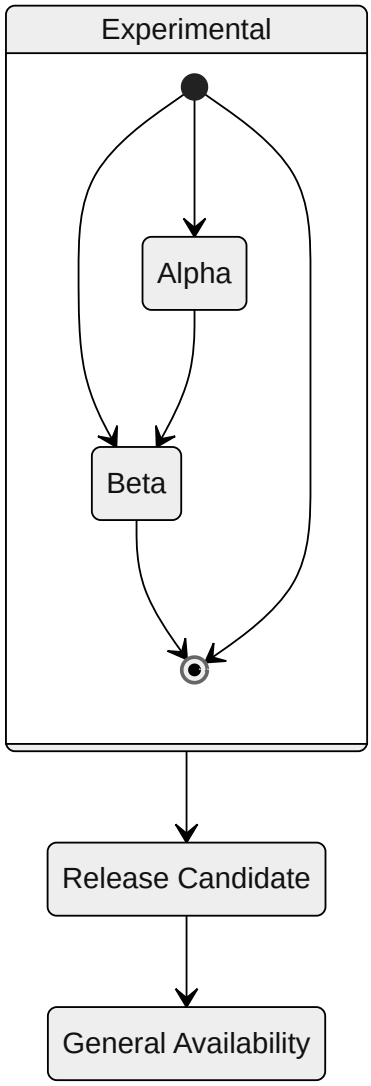
Example Plugin Declaration

The MariaDB plugin declaration looks like this:

```
/* MariaDB plugin declaration */
maria_declare_plugin(example)
{
   MYSQL_STORAGE_ENGINE_PLUGIN, /* the plugin type (see include/mysql/plugin.h) */
   &example_storage_engine_info, /* pointer to type-specific plugin descriptor   */
   "EXAMPLEDB", /* plugin name */
   "John Smith",  /* plugin author */
   "Example of plugin interface", /* the plugin description */
   PLUGIN_LICENSE_GPL, /* the plugin license (see include/mysql/plugin.h) */
   example_init_func,   /* Pointer to plugin initialization function */
   example_deinit_func,  /* Pointer to plugin deinitialization function */
   0x0001 /* Numeric version 0xAABB means AA.BB version */,
   example_status_variables,  /* Status variables */
   example_system_variables,  /* System variables */
   "0.1 example",  /* String version representation */
   MariaDB_PLUGIN_MATURITY_EXPERIMENTAL /* Maturity (see include/mysql/plugin.h)*/
}
maria_declare_plugin_end;
```

Maturity Guidelines For Plugins

Plugin Maturity At a Glance



Plugin Maturity Guidelines

> **Note:**
>
> New features or sufficiently big code changes to a plugin should lead to:
>
> - an increase of the plugin version
> - knocking the maturity level down.

- First a plugin is Alpha
- After at least 1.5 months (or more, in 3 month increments, until the quality is deemed acceptable) it becomes Gamma. Meanwhile it can transition through Beta as the maintainer wants (e,g. it can start directly from beta)
- After at least 3 more months (or more, in 3 month increments — depending on the bug inflow) it becomes Stable

If a plugin must be statically compiled into the server, it is a subject to an additional limitation — its maturity cannot be lower than the server's.

Beta Plugins In GA Releases

If a plugin contribution is added directly at beta maturity to a GA release series, it will not be removed from that release series. However, we reserve the right to exclude a plugin from future release series if it is unmaintained (for example, if it stops receiving bug fixes).

This page is licensed: CC BY-SA / Gnu FDL

Encryption Plugin Development

> **Note:**
>
> This page contains background information for MariaDB developers.

MariaDB's data-at-rest encryption requires the use of a key management and encryption plugin. These plugins are responsible both for the management of encryption keys and for the actual encryption and decryption of data.

MariaDB supports the use of multiple encryption keys. Each encryption key uses a 32-bit integer as a key identifier. If the specific plugin supports key rotation, encryption keys can also be rotated, which creates a new version of the encryption key.

See Data at Rest Encryption and Encryption Key Management for more information.

Encryption Plugin API

The Encryption plugin API was created to allow a plugin to:

- implement key management, provide encryption keys to the server on request and change them according to internal policies.
- implement actual data encryption and decryption with the algorithm defined by the plugin.

This is how the API reflects that:

```
/* Returned from get_latest_key_version() */
#define ENCRYPTION_KEY_VERSION_INVALID (~(unsigned int)0)
#define ENCRYPTION_KEY_NOT_ENCRYPTED (0)

#define ENCRYPTION_KEY_SYSTEM_DATA 1
#define ENCRYPTION_KEY_TEMPORARY_DATA 2

/* Returned from get_key()  */
#define ENCRYPTION_KEY_BUFFER_TOO_SMALL (100)

#define ENCRYPTION_FLAG_DECRYPT 0
#define ENCRYPTION_FLAG_ENCRYPT 1
#define ENCRYPTION_FLAG_NOPAD 2

struct st_mariadb_encryption {
  int interface_version; /**< version plugin uses */

  /******************** KEY MANAGEMENT ***********************************/

  /**
    Function returning latest key version for a given key id.

    @return A version or ENCRYPTION_KEY_VERSION_INVALID to indicate an error.
  */
  unsigned int (*get_latest_key_version)(unsigned int key_id);

  /**
    Function returning a key for a key version

    @param key_id       The requested key id
    @param version      The requested key version
    @param key          The key will be stored there. Can be NULL -
                        in which case no key will be returned
    @param key_length   in: key buffer size
                        out: the actual length of the key

    This method can be used to query the key length - the required
    buffer size - by passing key==NULL.

    If the buffer size is less than the key length the content of the
    key buffer is undefined (the plugin is free to partially fill it with
    the key data or leave it untouched).

    @return 0 on success, or
            ENCRYPTION_KEY_VERSION_INVALID, ENCRYPTION_KEY_BUFFER_TOO_SMALL
            or any other non-zero number for errors
  */
  unsigned int (*get_key)(unsigned int key_id, unsigned int version,
                          unsigned char *key, unsigned int *key_length);

  /******************** ENCRYPTION ***********************************/
  /*
    The caller uses encryption as follows:
      1. Create the encryption context object of the crypt_ctx_size() bytes.
      2. Initialize it with crypt_ctx_init().
      3. Repeat crypt_ctx_update() until there are no more data to encrypt.
      4. Write the remaining output bytes and destroy the context object
         with crypt_ctx_finish().
  */

  /**
    Returns the size of the encryption context object in bytes
  */
  unsigned int (*crypt_ctx_size)(unsigned int key_id, unsigned int key_version);
  /**
    Initializes the encryption context object.
  */
  int (*crypt_ctx_init)(void *ctx, const unsigned char *key, unsigned int klen,
```

```
                        const unsigned char *iv, unsigned int ivlen, int flags,
                        unsigned int key_id, unsigned int key_version);
  /**
    Processes (encrypts or decrypts) a chunk of data

    Writes the output to th dst buffer. note that it might write
    more bytes that were in the input. or less. or none at all.
  */
  int (*crypt_ctx_update)(void *ctx, const unsigned char *src,
                          unsigned int slen, unsigned char *dst,
                          unsigned int *dlen);
  /**
    Writes the remaining output bytes and destroys the encryption context

    crypt_ctx_update might've cached part of the output in the context,
    this method will flush these data out.
  */
  int (*crypt_ctx_finish)(void *ctx, unsigned char *dst, unsigned int *dlen);
  /**
    Returns the length of the encrypted data

    It returns the exact length, given only the source length.
    Which means, this API only supports encryption algorithms where
    the length of the encrypted data only depends on the length of the
    input (a.k.a. compression is not supported).
  */
  unsigned int (*encrypted_length)(unsigned int slen, unsigned int key_id,
                                   unsigned int key_version);
};
```

The first method is used for key rotation. A plugin that doesn't support key rotation — for example, **file_key_management** — can return a fixed version for any valid key id. Note that it still has to return an error for an invalid key id. The version `ENCRYPTION_KEY_NOT_ENCRYPTED` means that the data should not be encrypted.

The second method is used for key management, the server uses it to retrieve the key corresponding to a specific key identifier and a specific key version.

The last five methods deal with encryption. Note that they take the key to use and key identifier and version. This is needed because the server can derive a session-specific, user-specific, or a tablespace-specific key from the original encryption key as returned by `get_key()`, so the `key` argument doesn't have to match the encryption key as the plugin knows it. On the other hand, the encryption algorithm may depend on the key identifier and version (and in the **example_key_management** plugin it does) so the plugin needs to know them to be able to encrypt the data.

Encryption methods are optional — if unset (as in the **debug_key_management** plugin), the server will fall back to AES_CBC.

Current Encryption Plugins

The MariaDB source tree has four encryption plugins. All these plugins are fairly simple and can serve as good examples of the Encryption plugin API.

file_key_management

It reads encryption keys from a plain-text file. It supports two different encryption algorithms. It supports multiple encryption keys. It does not support key rotation.
See File Key Management Plugin for details.

aws_key_management

The AWS Key Management plugin uses the Amazon Web Services (AWS) Key Management Service (KMS) to generate and store AES keys on disk, in encrypted form, using the Customer Master Key (CMK) kept in AWS KMS.

When MariaDB Server starts, the plugin will decrypt the encrypted keys, using the AWS KMS “Decrypt” API function. MariaDB data will then be encrypted and decrypted using the AES key. It supports multiple encryption keys. It supports key rotation.

See AWS Key Management Plugin for details.

example_key_management

Uses random time-based generated keys, ignores key identifiers, supports key versions and key rotation. Uses AES_ECB and AES_CBC as encryption algorithms and changes them automatically together with key versions.

debug_key_management

Key is generated from the version, user manually controls key rotation. Only supports key identifier 1, uses only AES_CBC.

Encryption Service

Encryption is generally needed on the very low level **inside the storage engine**. That is, the storage engine needs to support encryption and have access to the encryption and key management functionality. The usual way for a plugin to access some functionality in the server is via a *service*. In this case the server provides the Encryption Service for storage engines (and other interested plugins) to use. These service functions are directly hooked into encryption plugin methods (described above).

Service functions are declared as follows:

```
unsigned int encryption_key_get_latest_version(unsigned int key_id);
unsigned int encryption_key_get(unsigned int key_id, unsigned int key_version,
                                unsigned char *buffer, unsigned int *length);
unsigned int encryption_ctx_size(unsigned int key_id, unsigned int key_version);
int encryption_ctx_init(void *ctx, const unsigned char *key, unsigned int klen,
                        const unsigned char *iv, unsigned int ivlen, int flags,
                        unsigned int key_id, unsigned int key_version);
int encryption_ctx_update(void *ctx, const unsigned char *src,
                          unsigned int slen, unsigned char *dst,
                          unsigned int *dlen);
int encryption_ctx_finish(void *ctx, unsigned char *dst, unsigned int *dlen);
unsigned int encryption_encrypted_length(unsigned int slen, unsigned int key_id,
                                         unsigned int key_version);
```

There are also convenience helpers to check for a key or key version existence and to encrypt or decrypt a block of data with one function call.

```
unsigned int encryption_key_id_exists(unsigned int id);
unsigned int encryption_key_version_exists(unsigned int id,
                                           unsigned int version);
int encryption_crypt(const unsigned char *src, unsigned int slen,
                     unsigned char *dst, unsigned int *dlen,
                     const unsigned char *key, unsigned int klen,
                     const unsigned char *iv, unsigned int ivlen, int flags,
                     unsigned int key_id, unsigned int key_version);
```

Audit Plugin Development

> **Note:**
>
> This page contains background information for MariaDB developers.

This page is licensed: CC BY-SA / Gnu FDL

Authentication Plugin Development

> **Note:**
>
> This page contains background information for MariaDB developers.

Authentication Plugin API

The authentication plugin API is extensively documented in the source code in the following files:

- `mysql/plugin_auth.h` (server part)
- `mysql/client_plugin.h` (client part)
- `mysql/plugin_auth_common.h` (common parts)

The MariaDB source code also contains some authentication plugins that are intended explicitly to be examples for developers. They are located in `plugin/auth_examples`.

The definitions of two example authentication plugins called `two_questions` and `three_attempts` can be seen in `plugin/auth_examples/dialog_examples.c`. These authentication plugins demonstrate how to communicate with the user using the dialog client authentication plugin.

The `two_questions` authentication plugin asks the user for a password and a confirmation ("Are you sure?").

The `three_attempts` authentication plugin gives the user three attempts to enter a correct password.

The password for both of these plugins should be specified in the plain text in the `USING` clause:

```
CREATE USER insecure IDENTIFIED VIA two_questions USING 'notverysecret';
```

Dialog Client Authentication Plugin - Client Library Extension

The dialog client authentication plugin, strictly speaking, is not part of the client-server or authentication plugin API. But it can be loaded into any client application that uses the `libmysqlclient` or MariaDB Connector/C libraries. This authentication plugin provides a way for the application to customize the UI of the dialog function.

In order to use the dialog client authentication plugin to communicate with the user in a customized way, the application will need to implement a function with the following signature:

```
extern "C" char *mysql_authentication_dialog_ask(
  MYSQL *mysql, int type, const char *prompt, char *buf, int buf_len)
```

The function takes the following arguments:

- The connection handle.
- A question "type", which has one of the following values:
  - `1` - Normal question
  - `2` - Password (no echo)
- A prompt.
- A buffer.
- The length of the buffer.

The function returns a pointer to a string of characters, as entered by the user. It may be stored in `buf` or allocated with `malloc()`.

By using this function, a GUI application can open a dialog window, and a network application can send the question over the network, as required. If no `mysql_authentication_dialog_ask` function is provided by the application, the dialog client authentication plugin falls back to fputs() and fgets().

Providing this callback is particularly important on Windows, because Windows GUI applications have no associated console and the default dialog function will not be able to reach the user. An example of Windows GUI client that does it correctly is HeidiSQL.

Information Schema Plugins: SHOW and FLUSH Statements

> **Note:**
>
> This page contains background information for MariaDB developers.

Information Schema plugins support SHOW and FLUSH statements.

SHOW

`SHOW` statement support is enabled by default. A plugin only has to specify column names for the `SHOW` statement in the `old_name` member of the field declaration structure. Columns with the `old_name` set to `0` are hidden from the `SHOW` statement. If all columns are hidden, the `SHOW` statement doesn't work for this plugin.

Note that `SHOW`` *statement*` is a user-friendly shortcut – it's easier to type and view. If the Information Schema table contains many columns, the `SHOW` statement is supposed to display only the most important columns, so that the output fits nicely on the 80x25 terminal screen.

Consider an example, the LOCALES plugin:

```
static ST_FIELD_INFO locale_info_locale_fields_info[]=
{
  {"ID", 4, MYSQL_TYPE_LONGLONG, 0, 0, "Id", 0},
  {"NAME", 255, MYSQL_TYPE_STRING, 0, 0, "Name", 0},
  {"DESCRIPTION", 255,  MYSQL_TYPE_STRING, 0, 0, "Description", 0},
  {"MAX_MONTH_NAME_LENGTH", 4, MYSQL_TYPE_LONGLONG, 0, 0, 0, 0},
  {"MAX_DAY_NAME_LENGTH", 4, MYSQL_TYPE_LONGLONG, 0, 0, 0, 0},
  {"DECIMAL_POINT", 2, MYSQL_TYPE_STRING, 0, 0, 0, 0},
  {"THOUSAND_SEP", 2, MYSQL_TYPE_STRING, 0, 0, 0, 0},
  {"ERROR_MESSAGE_LANGUAGE", 64, MYSQL_TYPE_STRING, 0, 0, "Error_Message_Language", 0},
  {0, 0, MYSQL_TYPE_STRING, 0, 0, 0, 0}
};
```

While the INFORMATION_SCHEMA.LOCALES table has 8 columns, the SHOW LOCALES statement only displays 4 of them:

```
MariaDB [test]> SHOW LOCALES;
+-----+-------+-------------------------------------+-------------------------+
| Id  | Name  | Description                         | Error_Message_Language |
+-----+-------+-------------------------------------+-------------------------+
|   0 | en_US | English - United States             | english                |
|   1 | en_GB | English - United Kingdom            | english                |
|   2 | ja_JP | Japanese - Japan                    | japanese               |
|   3 | sv_SE | Swedish - Sweden                    | swedish                |
...
```

FLUSH

To support the `FLUSH` statement, a plugin must declare the `reset_table` callback. For example, in the QUERY_RESPONSE_TIME plugin:

```
static int query_response_time_info_init(void *p)
{
  ST_SCHEMA_TABLE *i_s_query_response_time= (ST_SCHEMA_TABLE *) p;
  i_s_query_response_time->fields_info= query_response_time_fields_info;
  i_s_query_response_time->fill_table= query_response_time_fill;
  i_s_query_response_time->reset_table= query_response_time_flush;
  query_response_time_init();
  return 0;
}
```

Password Validation Plugin Development

> **Note:**
>
> This page contains background information for MariaDB developers.

Plugin API

Password validation plugin API is very simple. A plugin must implement only one method — `validate_password()`. This method takes two arguments — user name and the plain-text password. It returns `0` when the password has passed the validation; otherwise, `1`.

See also `mysql/plugin_password_validation.h` and password validation plugins in `plugin/simple_password_check/` and `plugins/cracklib_password_check/`.

Engine-defined New Table/Field/Index Attributes

> **Note:**
>
> This page contains background information for MariaDB developers.

In MariaDB, a storage engine can allow the user to specify additional attributes per index, field, or table. The engine needs to declare what attributes it introduces.

API

There are three new members in the `handlerton` structure, they can be set in the engine's initialization function as follows:

```
example_hton->table_options= example_table_option_array;
example_hton->field_options= example_field_option_array;
example_hton->index_options= example_index_option_array;
```

The arrays are declared statically, as in the following example:

```
static MYSQL_THDVAR_ULONG(varopt_default, PLUGIN_VAR_RQCMDARG,
  "default value of the VAROPT table option", NULL, NULL, 5, 0, 100, 0);

struct ha_table_option_struct
{
  char *strparam;
  ulonglong ullparam;
  uint enumparam;
  bool boolparam;
  ulonglong varparam;
};

ha_create_table_option example_table_option_list[]=
{
  HA_TOPTION_NUMBER("NUMBER", ullparam, UINT_MAX32, 0, UINT_MAX32, 10),
  HA_TOPTION_STRING("STR", strparam),
  HA_TOPTION_ENUM("ONE_OR_TWO", enumparam, "one,two", 0),
  HA_TOPTION_BOOL("YESNO", boolparam, 1),
  HA_TOPTION_SYSVAR("VAROPT", varopt, varparam),
  HA_TOPTION_END
};
```

The engine declares a structure `ha_table_option_struct` that will hold values of these new attributes.

And it describes these attributes to MySQL by creating an array of `HA_TOPTION_*` macros. Note a detail: these macros expect a structure called `ha_table_option_struct`, if the structure is called differently, a `#define` are needed.

There are five supported kinds of attributes:

macro name	attribute value type	corresponding C type	additional parameters of a macro
macro name	attribute value type	corresponding C type	additional parameters of a macro
HA_TOPTION_NUMBER	an integer number	unsigned long long	a default value, minimal allowed value, maximal allowed value, a factor, that any allowed should be a multiple of.
HA_TOPTION_STRING	a string	char *	none. The default value is a null pointer.
HA_TOPTION_ENUM	one value from a list of allowed values	unsigned int	a string with a comma-separated list of allowed values, and a default value as a number, starting from 0.
HA_TOPTION_BOOL	a boolean	bool	a default value
HA_TOPTION_SYSVAR	defined by the system variable	defined by the system variable	system variable name

Do not use `enum` for your `HA_TOPTION_ENUM` C structure members, the size of the `enum` depends on the compiler, and even on the compilation options, and the plugin API uses only types with known storage sizes.

In all macros the first two parameters are name of the attribute as should be used in SQL in the `CREATE TABLE` statement, and the name of the corresponding member of the `ha_table_option_struct` structure.

The `HA_TOPTION_SYSVAR` stands aside a bit. It does not specify the attribute type or the default value, instead it binds the attribute to a system variable. The attribute type and the range of allowed values are the same as of the corresponding system variable. The attribute **default value** are the **current value** of its system variable. And unlike other attribute types that are only stored in the `.frm` file if explicitly set in the `CREATE TABLE` statement, the `HA_TOPTION_SYSVAR` attributes are always stored. If the system variable value is changed, it will not affect existing tables. Note that for this very reason, if a table was created in the old version of a storage engine, and a new version has introduced a `HA_TOPTION_SYSVAR` attribute, the attribute value in the old tables are the **default** value of the system variable, not its **current** value.

The array ends with a `HA_TOPTION_END` macro.

Field and index (key) attributes are declared similarly using `HA_FOPTION_*` and `HA_IOPTION_*` macros.

> **CURRENT**
>
> When in a `CREATE TABLE` statement, the `::create()` handler method is called, the table attributes are available in the `option_struct` member of the handler, field attributes - in the `option_struct` member of the individual fields (objects of the `Field` class), index attributes - in the `option_struct` member of the individual keys (objects of the `KEY` class).
>
> **< 12.3**
>
> When in a `CREATE TABLE` statement, the `::create()` handler method is called, the table attributes are available in the `table_arg->s->option_struct`, field attributes - in the `option_struct` member of the individual fields (objects of the `Field` class), index attributes - in the `option_struct` member of the individual keys (objects of the `KEY` class).

Additionally, they are available in most other handler methods: the attributes are stored in the `.frm` file and on every open MySQL makes them available to the engine by filling the corresponding `option_struct` members of the table, fields, and keys.

The `ALTER TABLE` needs a special support from the engine. MySQL compares old and new table definitions to decide whether it needs to rebuild the table or not. As the semantics of the engine declared attributes is unknown, MySQL cannot make this decision by analyzing attribute values - this is delegated to the engine. The `HA_CREATE_INFO` structure has three new members:

```
ha_table_option_struct *option_struct;          ///< structure with parsed table options
ha_field_option_struct **fields_option_struct;  ///< array of field option structures
ha_index_option_struct **indexes_option_struct; ///< array of index option structures
```

The engine (in the `::check_if_incompatible_data()` method) is responsible for comparing new values of the attributes from the `HA_CREATE_INFO` structure with the old values from the table and returning `COMPATIBLE_DATA_NO` if they were changed in such a way that requires the table to be rebuild.

The example of declaring the attributes and comparing the values for the `ALTER TABLE` can be found in the EXAMPLE engine.

SQL

The engine declared attributes can be specified per field, index, or table in the `CREATE TABLE` or `ALTER TABLE`. The syntax is the conventional:

```
CREATE TABLE ... (
  field ... [attribute=value [attribute=value ...]],
  ...
  index ... [attribute=value [attribute=value ...]],
  ...
) ...  [attribute=value [attribute=value ...]]
```

All values must be specified as literals, not expressions. The value of a boolean option may be specified as one of YES, NO, ON, OFF, TRUE, FALSE, 1, or 0. A string value may be specified either quoted or not, as an identifier (if it is a valid identifier, of course — for example `ON` is a reserved keyword and must always be quoted, when used as a value). Additionally, when an enum option expects values of YES or NO, all other boolean aliases will automatically be recognized as well.

When an attribute is set, it is stored with the table definition and shown in the `SHOW CREATE TABLE;`. To remove an attribute from a table definition use `ALTER TABLE` to set its value to a `DEFAULT`.

The values of unknown attributes or attributes with the illegal values cause an error by default. But with ALTER TABLE one can change the storage engine and some previously valid attributes may become unknown — to the new engine. They are not removed automatically, though, because the table might be altered back to the first engine, and these attributes are valid again. Still SHOW CREATE TABLE will comment these unknown attributes out in the output, otherwise they would make a generated CREATE TABLE statement invalid.

With the `IGNORE_BAD_TABLE_OPTIONS` sql mode this behavior changes. Unknown attributes do not cause an error, they only result in a warning. And SHOW CREATE TABLE will not comment them out. This mode is implicitly enabled in the replication slave thread.

Table Discovery

> **Note:**
>
> This page contains background information for MariaDB developers.

In MariaDB, it is not always necessary to run an explicit `CREATE TABLE` statement for a table to appear. Sometimes a table may already exist in the storage engine, but the server does not know about it, because there is no `.frm` file for this table. This can happen for various reasons; for example, for a cluster engine the table might have been created in the cluster by another MariaDB server node. Or for the engine that supports table shipping a table file might have been simply copied into the MariaDB data directory. But no matter what the reason is, there is a mechanism for an engine to tell the server that the table exists. This mechanism is called **table discovery** and if an engine wants the server to discover its tables, the engine should support the table discovery API.

There are two different kinds of table discovery — a fully automatic discovery and a user-assisted one. In the former, the engine can automatically discover the table whenever an SQL statement needs it. In MariaDB, the Archive and Sequence engines support this kind of discovery. For example, one can copy a `t1.ARZ` file into the database directory and immediately start using it — the corresponding `.frm` file are created automatically. Or one can select from say, the `seq_1_to_10` table without any explicit `CREATE TABLE` statement.

In the latter, user-assisted, discovery the engine does not have enough information to discover the table all on its own. But it can discover the table structure if the user provides certain additional information. In this case, an explicit

`CREATE TABLE` statement is still necessary, but it should contain no table structure — only the table name and the table attributes. In MariaDB, the FederatedX storage engine supports this. When creating a table, one only needs to specify the `CONNECTION` attribute and the table structure — fields and indexes — are provided automatically by the engine.

Automatic Discovery

As far as automatic table discovery is concerned, the tables, from the server point of view, may appear, disappear, or change structure anytime. Thus the server needs to be able to ask whether a given table exists and what its structure is. It needs to be notified when a table structure changes outside of the server. And it needs to be able to get a list of all (unknown to the server) tables, for statements like `SHOW TABLES`. The server does all that by invoking specific methods of the `handlerton`:

```
const char **tablefile_extensions;
int (*discover_table_names)(handlerton *hton, LEX_STRING *db, MY_DIR *dir,
                            discovered_list *result);
int (*discover_table_existence)(handlerton *hton, const char *db,
                                const char *table_name);
int (*discover_table)(handlerton *hton, THD* thd, TABLE_SHARE *share);
```

handlerton::tablefile_extensions

Engines that store tables in separate files (one table might occupy many files with different extensions, but having the same base file name) should store the list of possible extensions in the **tablefile_extensions** member of the `handlerton` (earlier this list was returned by the `handler::bas_ext()` method). This will significantly simplify the discovery implementation for these engines, as you will see below.

handlerton::discover_table_names()

When a user asks for a list of tables in a specific database — for example, by using `SHOW TABLES` or by selecting from `INFORMATION_SCHEMA.TABLES` — the server invokes **discover_table_names()** method of the `handlerton`. For convenience this method, besides the database name in question, gets the list of all files in this database directory, so that the engine can look for table files without doing any filesystem i/o. All discovered tables should be added to the `result` collector object. It is defined as

```
class discovered_list
{
  public:
  bool add_table(const char *tname, size_t tlen);
  bool add_file(const char *fname);
};
```

and the engine should call `result->add_table()` or `result->add_file()` for every discovered table (use `add_file()` if the name to add is in the MariaDB file name encoding, and `add_table()` if it's a true table name, as shown in `SHOW TABLES`).

If the engine is file-based, that is, it has non-empty list in the `tablefile_extensions`, this method is optional. For any file-based engine that does not implement `discover_table_names()`, MariaDB will automatically discover the list of all tables of this engine, by looking for files with the extension `tablefile_extensions[0]`.

handlerton::discover_table_existence()

In some rare cases MariaDB needs to know whether a given table exists, but does not particularly care about this table structure (for example, when executing a `DROP TABLE` statement). In these cases, the server uses the **discover_table_existence()** method to find out whether a table with the given name exists in the engine.

This method is optional. For the engine that does not implement it, MariaDB will look for files with the `tablefile_extensions[0]`, if possible. But if the engine is not file-based, MariaDB will use the `discover_table()` method to perform a full table discovery. While this will allow determining correctly whether a table exists, a full discovery is usually slower than the simple existence check. In other words, engines that are not file-based might want to support `discover_table_existence()` method as a useful optimization.

handlerton::discover_table()

This is the main method of table discovery, the heart of it. The server invokes it when it wants to use the table. The **discover_table()** method gets the `TABLE_SHARE` structure, which is not completely initialized — only the table and the database name (and a path to the table file) are filled in. It should initialize this `TABLE_SHARE` with the desired table structure.

MariaDB provides convenient and easy to use helpers that allow the engine to initialize the `TABLE_SHARE` with minimal efforts. They are the `TABLE_SHARE` methods `init_from_binary_frm_image()` and `init_from_sql_statement_string()`.

TABLE_SHARE::init_from_binary_frm_image()

This method is used by engines that use “frm shipping” — such as Archive or NDB Cluster in MySQL. An frm shipping engine reads the frm file for a given table, exactly as it was generated by the server, and stores it internally. Later it can discover the table structure by using this very frm image. In this sense, a separate frm file in the database directory becomes redundant, because a copy of it is stored in the engine.

TABLE_SHARE::init_from_sql_statement_string()

This method allows initializing the `TABLE_SHARE` using a conventional SQL `CREATE TABLE` syntax.

TABLE_SHARE::read_frm_image()

Engines that use frm shipping need to get the frm image corresponding to a particular table (typically in the `handler::create()` method). They do it via the **read_frm_image()** method. It returns an allocated buffer with the binary frm image, that the engine can use the way it needs.

TABLE_SHARE::free_frm_image()

The frm image that was returned by `read_frm_image()` must be freed with the **free_frm_image()**.

HA_ERR_TABLE_DEF_CHANGED

One of the consequences of automatic discovery is that the table definition might change when the server doesn’t expect it to. Between two `SELECT` queries, for example. If this happens, if the engine detects that the server is using an outdated version of the table definition, it should return a **HA_ERR_TABLE_DEF_CHANGED** handler error. Depending on when in the query processing this error has happened, MariaDB will either re-discover the table and execute the query with the correct table structure, or abort the query and return an error message to the user.

TABLE_SHARE::tabledef_version

The previous paragraph doesn’t cover one important question — how can the engine know that the server uses an outdated table definition? The answer is — by checking the **tabledef_version**, the table definition version. Every table gets a unique `tabledef_version` value. Normally it is generated automatically when a table is created. When a table is discovered the engine can force it to have a specific `tabledef_version` value (simply by setting it in the `TABLE_SHARE` before calling the `init_from_binary_frm_image()` or `init_from_sql_statement_string()` methods).

Now the engine can compare the table definition version that the server is using (from any handler method it can be accessed as `this->table->s->tabledef_version`) with the version of the actual table definition. If they differ — it is `HA_ERR_TABLE_DEF_CHANGED`.

Assisted discovery

Assisted discovery is a lot simpler from the server point of view, a lot more controlled. The table cannot appear or disappear at will, one still needs explicit DDL statements to manipulate it. There is only one new handlerton method that the server uses to discover the table structure when a user has issued an explicit `CREATE TABLE` statement without declaring any columns or indexes.

```
int (*discover_table_structure)(handlerton *hton, THD* thd,
                                TABLE_SHARE *share, HA_CREATE_INFO *info);
```

The assisted discovery API is pretty much independent from the automatic discovery API. An engine can implement either of them or both (or none); there is no requirement to support automatic discovery if only assisted discovery is needed.

handlerton::discover_table_structure()

Much like the `discover_table()` method, the **discover_table_structure()** handlerton method gets a partially initialized `TABLE_SHARE` with the table name, database name, and a path to table files filled in, but without a table structure. Unlike `discover_table()`, here the `TABLE_SHARE` has all the engine-defined table attributes in the `TABLE_SHARE::option_struct` structure. Based on the values of these attributes the `discover_table_structure()` method should initialize the `TABLE_SHARE` with the desired set of fields and keys. It can use `TABLE_SHARE` helper methods `init_from_binary_frm_image()` and `init_from_sql_statement_string()` for that.

The role of `.frm` files

Before table discovery was introduced, MariaDB used `.frm` files to store the table definition. But now the engine can store the table definition (if the engine supports automatic discovery, of course), and `.frm` files become redundant. Still, the server *can* use `.frm` files for such an engine — but they are no longer the only source of the table definition. Now `.frm` files are merely a *cache* of the table definition, while the original authoritative table definition is stored in the engine. Like any cache, its purpose is to reduce discovery attempts for a table. The engine decides whether it makes sense to cache table definition in the `.frm` file or not (see the second argument for the `TABLE_SHARE::init_from_binary_frm_image()`). For example, the Archive engine uses `.frm` cache, while the Sequence engine does not. In other words, MariaDB creates `.frm` files for Archive tables, but not for Sequence tables.

The cache is completely transparent for a user; MariaDB makes sure that it always stores the actual table definition and invalidates the `.frm` file automatically when it becomes out of date. This can happen, for example, if a user copies a new Archive table into the datadir and forgets to delete the `.frm` file of the old table with the same name.

MariaDB Server Roadmap

> **Note:**
>
> This page contains background information for MariaDB developers.

This page talks in general about the MariaDB Server roadmap, and how it is formed.The roadmap it describes is located in our JIRA issue tracker: **jira.mariadb.org**

MariaDB was designed as a drop-in replacement of MySQL with more features, new storage engines, fewer bugs, and better performance. We aim to make upgrading from MySQL to MariaDB extremely easy.

The roadmap for MariaDB Server is formed by its engineers and product managers, with input from the community.

MariaDB Server developers work with several storage engine vendors and developers to get the best storage engines into MariaDB Server.

The collected information is then turned into specific tasks which are then prioritized and added to the roadmap in the JIRA issue tracker at **jira.mariadb.org**

Goals and Quality Standards

The primary goal of MariaDB Server is for it to be a practical database developed in the direction users and developers want it to be developed. Each feature should ideally be developed by or for users who want to test and put the feature into production ASAP — this helps ensure we don't implement features no one wants or needs.

We are also putting a lot of effort into speeding up MariaDB Server, and to keep it stable and easy to use!

The MariaDB Server source tree is maintained by MariaDB the company and its developers. They are the primary contributors to the MariaDB Server project and the ones who are ultimately responsible for the quality of the code.

MariaDB Server 5.1, MariaDB Server 5.2, and MariaDB Server 5.3 were built off of MySQL 5.1.

MariaDB Server 5.5 was a combination of MariaDB Server 5.3 and MySQL 5.5.

MariaDB Server 10.0, and later build off of the previous MariaDB Server releases with backported features from MySQL and entirely new features not found anywhere else.

Short descriptions of the various MariaDB Server releases and their main new features can be found on the MariaDB Server Releases page.

Plans

MariaDB 12.3 is an upcoming major development release.

JIRA

We manage our development plans in JIRA, so the definitive list will be there. This search shows what we **currently** plan for 12.3. It shows all tasks with the **Fix-Version** being 12.3. Not all these tasks will really end up in the release but tasks with the “red” priorities have a much higher chance of being done in time. Practically, you can think of these tasks as “features that **will** be in 12.3”. Tasks with the “green” priorities probably won’t be in. Think of them as “bonus features that would be **nice to have** in 12.3”.

Contributing

If you want to be part of developing any of these features, see Contributing to the MariaDB Project. You can also add new features to this list or to JIRA.

Working with GitHub

> **Note:**
>
> This page contains background information for MariaDB developers.

Benefits of a Pull Request

A pull request created on GitHub provides visibility to the entire userbase on the changes that are occurring in MariaDB Server.

The pull request created automatically triggers the required Buildbot builds associated with it.

The created pull request is associated with a MariaDB Server branch where it is to be merged. There have been cases where a passing protected branch build has been incorrectly pushed to a former branch by mistake.

A pull request on GitHub can be reviewed, and those reviewing it might have valuable insight. By putting all the reviews in one location, reviewers can learn off each other and not repeat works already review. The reviews are there for future reference if additional though is requires as to why a particular change was made.

A pull request has a clear indicator of the reviews conducted, by who, and who you are expecting further reviews from.

When a developer with commit access, either the author or a reviewer has completed and passed a review, they can mark the pull request as auto-merge, enabling the pull request to be merge once the [[branch-protection-using-buildbot|protected branch builds] have passed.

Mechanism of Creating a Pull Request

A pull request can be created on the MariaDB GitHub web page, server, or any fork created using GitHub.

Alternately GitHub has an open source [|command line client] that has RPM and Deb packages, and a static compiled executable. This is actively maintained.

Creating a Branch

So to make a GitHub pull request you already have some code/changes that you have committed locally. Ideally, this will be on its own branch, rebased onto the MariaDB server branch where it is intended to merge.

A pull request starts from a public branch. You can either create a pull request from a public fork of the MariaDB Server, or if you have access, a branch on the MariaDB Server. Both will achieve the same outcome.

If you are creating on the MariaDB server, a branch name of the MDEV associated with the issue is recommended. If there are targeted branch names that need specific fixes, then prepending the target branch name to the newly created branch is recommended.

Previous documentation suggested a bb-*prefix. This will trigger duplicate runs through Buildbot so your assistance in saving it some work would be appreciated.

This gives other server developers a reasonable visibility of to why the branch is there, a way to check if it can be deleted, and who to ask about in a single branch name.

Creating a Pull Request

If you push with a command line client over a ssh transport remote, the output from GitHub will provide a link to create the pull request. This can be opened in your browser to complete the process.

To use the *gh cli*, use [[gh_pr_create|`gh pr create`] to interactively create it, or use a variety of the command line options to increase the automation.

Common options you may wish to use:

- --base BRANCH - the branch to commit to
- --assignee GITHUB_HANDLE - the primary person you wish to review this
- --review GITHUB_HANDLE - multiple people you wish to review this
- --fill - to create the PR content base on your commit(s) in your branch
- --draft - if you have a partial concept or unfinished work for a review. This gives a clear indication to not merge as is.
- --label MariaDB Corporation - a label to make it easy to distinguish your affiliation to make the MariaDB Foundations job easier to identify external contributions.

Wait for Review

While waiting for a review it might be possible that someone introduces changes in the code what conflict with your code. It might also be the case that you have some improvements to make. If this is the case, rebase or adjust your commits locally, and then *git push –force-with-lease* to the same branch as before. This will automaticity update the pull request and retrigger buildbot.

Examining Buildbot Results.

From the pull request number created, substitute that into the ID of the URL below will access all the builds based on that PR.

grid?branch=refs%2Fpull%2FID%2Fmerge

Code Coverage

> **Note:**
>
> This page contains background information for MariaDB developers.

Code Coverage

We are working on getting more of the MariaDB source covered by our mysql-test-run (MTR) test suite. This is an ongoing task.

Goals for new code

For new code in MariaDB, we aim much higher:

The goals are:

1. All new lines of code should ideally be tested by MTR.
2. Code which cannot reasonably be tested by MTR needs to be tested by another tool and those code lines marked with `/* purecov: tested */`.

    - In this case the tool used for testing should be documented in the worklog entry for the code or in the commit message.

3. Code that can't reasonably be tested (such as error conditions) should be marked with `/* purecov: inspected */` so that a reviewer of the code can easily spot this code.
4. Code that is suspected to be deadcode should have a `DBUG_ASSERT(0)` or be marked with `/* purecov: deadcode */` so that we have a chance to notice if the code is ever executed.

The reason we are using 'purecov' to mark lines is an attribution to the purecov tool we originally used for code coverage in the early years of MySQL.

Markers

The recommended markers are:

`/* purecov: tested */`

- For code lines that are tested by something *other* than mysql-test-run:

`/* purecov: inspected */`

- For code lines that are hard to test but for which one has read the line multiple times to ensure it is correct. A code reviewer should also inspect these lines with care as they have not been properly tested.

`/* purecov: deadcode */`

- For code lines that one suspects will never be called. Having this marker allows us to generate a warning during mysql-test-run code coverage if this line is executed.

The comment must be placed on the line/lines that are affected.

For code blocks larger than 1 line one can use the block syntax:

```
/* purecov: begin tested */
....
/* purecov: end */
```

Running mysql-test-run With gcov

Prerequisites

1. First make sure that gcov 4.9 is installed.Older versions of the gocv library (lgcov) can't handle running several instances of a program in parallel. This causes the generated .gov files to not contain all executed lines when running `mysql-test-run` with the `--parallel` option or running test that starts several mysqld servers, like replication or spider tests.
2. Compile MariaDB with `BUILD/compile-pentium64-gcov` (if your machine does not have a pentium CPU, hack this script, or just live with the pentium-specific stuff).

Running mysql-test-run

To be able to see the level of coverage within the current test suite, do the following:

1. In the mysql-test directory, run this command: `./mysql-test-run -gcov`
2. To see which lines are not yet covered, look at `source_file_name.gcov` in the source tree. In MariaDB 10.1 or below it's in the CMakeFiles directory where the object files are stored. In MariaDB 10.2 it's stored together with the source files.
3. Think hard about a test case which will cover those lines that are not tested, and write one.

Tools

- You can use the code-coverage-with-dgcov/dgcov tool to check the coverage for the new code. This is especially written and maintained for MariaDB.
- For code coverage you also use the lcov tool.

Code coverage in buildbot

buildbot, the MariaDB build system, is doing automatic coverage testing for each push.

This page is licensed: CC BY-SA / Gnu FDL

Code Coverage With dgcov

> **Note:**
>
> This page contains background information for MariaDB developers.

The `dgcov` tool helps you check the coverage for new code. The `dgcov.pl` script is part of the mariadb-test framework (and any packages that include mariadb-test).

Overview

The `dgcov` program runs `gcov` for code coverage analysis aggregates the coverage data, and optionally reports coverage only for those lines that are changed by commits. Commits are specified in the `git diff` format.

If no commits are specified, the default is to work on all uncommitted changes, if any, otherwise on the last commit (in other words, on `git diff HEAD` or `git diff HEAD^`).

It's recommended that a developer runs dgcov on their new code before pushing it into a MariaDB repository.

Usage

```
./dgcov.pl --help
./dgcov.pl [options] [<commit> [<commit>]]
```

Options and Variables

Short Option	Long Option	Description
`-h`	`--help`	Print help and exit
`-v`	`--verbose`	Show commands run.
`-p`	`--purge`	Delete all test coverage information, to prepare for a new coverage test.
`-o`	`--only-gcov`	Stop after running gcov, don't run git
`-s`	`--skip-gcov`	Do not run `gcov`, assume `.gcov` files are already in place
`-g`	`--generate`	Create `.dgcov` files for all source files

How to Prepare Code for dgcov

Prior to running this tool, MariaDB should be built like this:

```
cmake -DENABLE_GCOV=ON
```

In addition, the test suite should be run. `dgcov` reports the coverage for all lines modified in the specified commits.

Output

Output `.dgcov` files have a conventional `gcov` format: Lines not covered are prefixed with `#####`, lines without generated code are prefixed with `-`, and other lines are prefixed with the number of times they were executed. See `info gcov` for more information.

The patch-like coverage for commits uses `gcov` format (as above) for lines, changed in these commits, and no prefix at all for lines that were not changed.

Examples

Checking the coverage for all unpushed commits:

```
dgcov.pl @{u} HEAD
```

Checking the coverage for all uncommitted changes:

```
dgcov.pl HEAD
```

Checking the coverage for a specific commit *1234567*:

```
dgcov.pl 1234567^ 1234567
```

mariadb-test-run can invoke `dgcov` automatically:

```
./mtr --gcov
```

In the latter case, the coverage for uncommitted changes (or for the last commit) is not printed to `stdout`, but to the `var/last_changes.dgcov` file.

Caveats

> **Note:**
>
> To be able to run `gcov` with the mariadb-test framework, you must have `gcc` version 4.8 or newer.

References

- `dgcov` was created by Kristian Nielsen and announced here.
- `dgcov` was reimplemented to aggregate the data, and to work for `git` and `cmake`, by Sergei Golubchik.

QA Tests

> **Note:**
>
> This page contains background information for MariaDB developers.

Optimizer and the Random Query Generator

The RQG[47] is used to test various Optimizer features. See Optimizer Quality for more information.

Aria Engine Recovery

The QA - Aria Recovery page contains a plan on how to test it.

Upgrade and Installer Testing

- Upgrades using `.deb` and RPM packages are tested using very simple tests in BuildBot by the various `bld_kvm*` builders.

TODO

- More complex tests around `.deb`, RPM and tarballs.
- Decide on specific upgrade/downgrade paths (e.g. MySQL 5.5 to MariaDB 2.2?) and methods (`mysqldump`, `mysql_upgrade`) that we support and test each individually.
- Test the Windows installer and service NSIS allows for scripted unattended installs by providing an `/SD` argument to functions such as `MessageBox`.
- Test the contents of the Windows package, e.g. if `HELP`, `.test`, and other files are properly placed and runnable.

Linking Testing

The purpose of those tests is to check that various applications that use `libmysql` can be compiled, linked and run with MariaDB. They are run by the `compile-connectors` builder in BuildBot.

- Perl `DBD::mysql`
  - We configure and compile the Perl DBI MySQL driver. Then we run the test suite provided with it.
- PHP
  - We configure and compile both the `mysql` and `mysqli` PHP drivers without `mysql-nd`. For each, we run those tests from the PHP test suite that are known to be good (other tests fail for both MySQL and MariaDB).
- TODO: Perl and PHP with the embedded library.

Connectors Testing

The purpose of those tests is to check that the libraries that implement the MySQL protocol can work with MariaDB.

- The `libmysql` library/connector is tested both by the MTR test suite (since `mysqltest` links with it).

TODO

- PHP with the `mysql-nd` driver
- Connector C++
- JDBC

Replication Testing

Individual applications:

- group commit:

```
perl runall.pl \
  --engine=InnoDB \
  --grammar=conf/replication/rpl_transactions.yy \
  --gendata=conf/replication/rpl_transactions.zz \
  --mysqld=--sync_binlog=1 \
  --mysqld=--innodb-flush_log_at_trx_commit=1 \
  --mysqld=--binlog-dbug_fsync_sleep=100000 \
  --mysqld=--default-storage-engine=InnoDB \
  --threads=15 \
  --queries=1M \
  --duration=600 \
  --validator=None
```

This page is licensed: CC BY-SA / Gnu FDL

QA Metrics

> **Note:**
>
> This page contains background information for MariaDB developers.

Code Coverage

The `gcov` or `lcov` reports are run by BuildBot. The tests that are run to obtain the coverage percentage are listed under the `f_gcov` Factory in the BuildBot configuration file.

Bugs

The list of MariaDB bugs is available on JIRA.

This page is licensed: CC BY-SA / Gnu FDL

Optimizer Quality

> **Note:**
>
> This page contains background information for MariaDB developers.

Generating the Queries

There are 5 primary SQL grammars available for testing the Optimizer:

- `optimizer_nosubquery.yy` generates random queries with no subselects, with up to 3-way join and with various SQL clauses such as aggregates, `GROUP BY`, `HAVING`, and `LIMIT`.
- `optimizer_subquery.yy` generates queries with subselects with up to 2 levels of nesting. Subqueries are placed in various locations, such as in the `SELECT` list, in the `ON` clause, etc. Aggregates, `LIMIT`, `HAVING`, etc. are used if allowed by the server.
- `optimizer_subquery.yy` generates outer joins of various depths.

- `range_optimizer.yy` tests the range optimizer by joining several tables and generating various conditions on which range optimization is likely to be applied.
- `range_optimizer2.yy` tests the range optimizer by generating single-table queries that contain a lot of range-optimizable clauses. Avoiding joins allows the single table to be arbitrarily large, this allowing for more interesting range overlaps.

Validating the Results

The RQG[48] has two primary modes for validating the results:

- Using a reference implementation. This can be a PostgreSQL, JavaDB or another version or flavor of MySQL/Maria/Drizzle. Testing this way requires trusting external software that is not under our control. Also, it is sometimes difficult to determine which implementation has returned the correct result. Technically, 3 implementations can "vote" as to which is the correct result, but this is not reliable if the implementations all derive from one another.
- Executing the generated query using a different execution plan. This is usually achieved by disabling particular optimizations and thus "downgrading" the plan to a more basic, presumed stable one. It is assumed that a nested-loop-join that takes no advantage of indexes would always provide the correct result. The advantage of this approach is that there is no need for a reference implementation and the source of the wrong result can be obtained by diffing the original and the downgraded execution plan.

In addition to result set validation, there is a module which executes each generated `SELECT` in various contexts, such as part of a union, stored procedure, trigger, etc. and makes sure that the query returns a correct result. This is most often used for testing subselects.

Running a Complete Test Cycle

A test cycle is described in a configuration file called the CC file. The CC file contains a list of mysqld options to use, the list of grammars to use and other settings (e.g. storage engines, table sizes, etc.). The testing framework will then take a random permutation from the settings described in the file and run them as a RQG test for a predefined time, such as 10 minutes. This is repeated up to 100 times, each with a different random permutation. The PRNG seed for each run will also be different, so different queries will be generated for each run, in addition to using different mysqld options, engine, etc.

By default, all cycles include MyISAM, Aria and InnoDB, and some percentage are run under Valgrind. Cycles run with both `NULL` and `NOT NULL` fields and with and without simple views.

Configuration for Join Cache Testing

`outer_join_with_cache` is always `ON`. `--join_cache_level` varies from `0` to `8`. `--join_buffer_size` varies between 1, 100, 1K, 10K and 100K. The `optimizer_no_subquery.yy`, `outer_join.yy` and `range_access.yy` grammars are used. Once semijoin is stable, `join_cache` + `semijoin` are tested with `optimizer_subquery.yy`.

Configuration for MRR/ICP/DS-MRR-CPK Testing

`--optimizer_use_mrr` is ON, `mrr_sort_keys` is both `ON` and `OFF`, `index_condition_pushdown` is both ON and OFF, `join_cache_level` is between 0 and 8, `join_buffer_size` and `mrr_buffer_size` are 1, 100, 1K, 10K and 100K. `optimizer_no_subquery.yy`, `outer_join.yy`, `range_access.yy` and `range_access2.yy` grammars are used.

Configuration for Subquery Testing

The `optimizer_no_subquery.yy` grammar is used. Each individual `optimizer_switch` related to subquery optimization may be disabled so that the "second best" plan is generated.

QA - Aria Recovery

> **Note:**
>
> This page contains background information for MariaDB developers.

General Principles

Recovery is tested via the RQG, which provides a random workload against the server, and then uses kill -9 to kill the process. After that, recovery is attempted both by using `maria_read_log` and by restarting the `mysqld` process. Once the server has started up, the tables are verified in various ways, including `ALTER|OPTIMIZE|ANALYZE|REPAIR TABLE` as well `SELECT` queries that read the table back and forth using various access methods.

A combinations `.cc` file named `lp:randgen/conf/engines/maria/maria_recovery.cc` is used to define various `mysql` options and RQG parameters that are relevant to recovery. Then, RQG's `combinations.pl` script is used to run hundreds of individual test runs. Each run uses a random permutation from the settings in the `.cc` file in order to generate a unique workload that is then validated via the `Recovery` RQG Reporter.

Individual tests

The following are the individual tests or test runs that must be completed or created in order to ensure that Aria recovery is solid.

Standard kill -9 Testing

Done 2011-02-28 The standard `conf/engines/maria/maria_recovery.cc` passes with no failures when run with hundreds of trials.

Testing With Small Block Sizes

On hold pending 2 bug fixes related to –maria-block-size=1K and –maria-block-size=2K

Testing With Small Page Cache Size

Done 2011-03-04 Completed 400 rounds with

```
'--mysqld=--maria-block-size=4K --mysqld=--maria-pagecache-buffer-size=128K',
'--mysqld=--maria-block-size=16K --mysqld=--maria-pagecache-buffer-size=256K',
'--mysqld=--maria-block-size=32K --mysqld=--maria-pagecache-buffer-size=512K'
```

Two pre-recovery crashes were filed, no recovery issues.

Killing and Restarting the Recovery Process

In Progress

The AriaDoubleRecovery reporter currently attempts double recovery via `maria_read_log`. The first invocation of `maria_read_log` is killed halfway through the process, and the second invocation is left to complete the recovery.

Future testing involves doing the same with the `mysqld` server in place of `maria_read_log`.

Another Realistic Workload

The usefulness of the SMF workload, derived from the SimpleMachines forum application means that another such workload is required in order to make sure no residual recovery bugs remain. Hopefully something can be cooked up using Wikipedia so that longer fields and blobs are exercised.

Transactional consistency

A transactional grammar that simulates transactions using `LOCK TABLE` statements is required. The `RecoveryConsistency Reporter` can then be used to validate that no partial transactions appear in the database after recovery.

Worklog Quality Checklist Template

> **Note:**
>
> This page contains background information for MariaDB developers.

The purpose of this template is to produce individual checklists for testing individual Worklogs. Using a checklist ensures that all WLs[49] are treated equally and that all important points are addressed and tested, or at least considered when clearing the WL[50] for merging into a stable release.

Inputs

This page lists all sources of information which can be used as inputs to the testing process. The goal is to gather comprehensive information before creating a testing plan.

Usage Scenario

TODO: Summarize here the intended use for the feature.

Design, Architecture, Specification

- **WorkLog number and title:**
  - *If there is no Worklog, create one or ask one to be created*
- **Are HLS and LLS present?**
  - *If the HLS or LLS sections are missing, add them or ask that they are created*

- **Reviewer name:**
  - *Testing suggestions and concerns should be obtained by the reviewer*
- **Customer requirements:**
  - *Make yourself familiar with any requirements or documents supplied by the customer*
- **Other implementations:**
  - *Make yourself familiar with other implementations of the feature in other database products or flavors of MySQL*

Testability and Observability

- **Does the feature have an on/off switch?**
  - *An on/off switch is required in at least the following situations:*
    - *A RQG comparison test will be performed in order to validate the feature;*
    - *The feature may cause a performance degradation for certain queries or usage scenarios;*
    - *The feature is experimental or of interest to a small number of users;*
- **Is the operation of the feature observable?**
  - *Does the feature leave any traces in* `SHOW STATUS` *or* `EXPLAIN`*, or in the logs?*

The Patch

- **List of modified files:**
  - *Obtain a list of all modified files from the version control system, to serve as a starting point for identifying areas of risk within the server or potential interactions with other features. A larger number of modified files may indicate larger risk of unforeseen interactions*
- **Review comments:**
  - *Paste a link to the review and read it for any concerns that the reviewer may have raised*
- **MTR tests:**
  - *Does the patch include enough MTR tests?*
- **DGCov output:**
  - *Generate a report or obtain it from a developer and make sure it is acceptable for all parties*

Feedback From Interested Parties

- **Feedback from developer:**
  - *Paste here any useful information provided by the developer in informal discussions, emails or chat*
  - *Make sure any concerns raised by the developer are recorded in this document*
- **Feedback from reviewer:**
  - *Paste here any discussions with the reviewer related to concerns, risks or testing, if not included in the formal review comments for the patch itself*
- **Feedback from customer:**
  - *Summarize here any relevant discussions with the customer*

Query Patterns

If the feature relates to the optimization of a particular set of queries, provide here examples that were extracted from the sources of information listed above, in particular the Worklog and any MTR test cases provided with the patch.

Risks

This section lists any risks inherent to the Worklog, as identified by reviewing the inputs mentioned

Refactoring

- **Areas that have been refactored:**
  - *List areas that have been refactored in order to accommodate the new functionality*

Interactions

- **Areas of potential interaction:**
  - *List areas in the server that may have an interaction with the feature*
- **Does the feature contain engine-specific code, hooks or hacks?**
  - *List any engine-specific considerations there may be*
- **Does the feature define a new API?**
- **Does the feature relate to transactions or transactional integrity?**
  - *If yes, is testing required on all storage engines, or using cross-engine transactions or binlog involvement?*
- **Does the feature relate to any of the core server features?**
  - *Do we need to test with views, triggers, stored procedures, functions, events, partitions, foreign keys, time zones*

Upgrade or Downgrade

- **Does the feature change any on-disk formats?**
  - *If yes, testing would be required that upgrading to the new format works properly*
- **Does the feature change the format of the system tables in the `mysql` database?**
  - *If yes, testing would be required to make sure that any upgrade/downgrade scripts are able to handle the change gracefully*
- **Does the feature change or retire or deprecate any mysqld configuration options?**
  - *List options here*
- **Is downgrade to be supported?**
  - *If using the new feature makes the database non-downgradable, this must be a conscious design decision*

User-Visible Changes

- **Does the feature change the mysql protocol?**
  - *If yes, full connectors testing is required to make sure the change is compatible*
- **Does the feature change any result formatting or data types?**
  - *If yes, testing via the `mysql` client is required to verify that the new format or data type properly arrives at the client*
- **Does the feature change the syntax or the output of a `SHOW` command?**
  - *If yes, clients, connectors and tools that issue that `SHOW` command and process its output should be tested*
- **Does the feature change anything with respect to `INFORMATION_SCHEMA` and `PERFORMANCE_SCHEMA` ?**

Performance and Optimizer

- **Does the feature have any performance implications?**
  - *Is the feature expected to deliver any performance improvement?*
  - *Is the feature feared to have a performance impact?*

- **Does the feature interact with the Optimizer or indexes?**
  - *Does the feature change anything related to indexes or data stored in them?*
  - *Does the feature change anything with respect to any optimizations?*

Replication

Does the feature generate or transmit data that may be sent or processed by the slave or tools such as `mysqlbinlog`*?*

- **Which binary log formats should be tested?**
  - *Certain optimizations or scenarios may only trigger for a particular binary log mode*
- **Are existing replication RQG grammars sufficient to trigger the new code?**
- **Do we need to test DDL in replication, log rotation and such?**
- **Does the change affect the master as well, or just the slave? Is a transactional integrity test indicated?**
- **Do we need to simulate replication failures, server restarts and such?**
- **Do we need to test cloning new slaves from scratch, binary log replay and other replication maintenance activities?**
- **Do we need to cover exotic data types, overly large records, statements that are only safe in a particular binlog mode, etc?**

Extreme Conditions and Corner Cases

- **Does the feature deal with extreme conditions and corner cases?**
  - *e.g. huge values, huge tables, huge row lengths, blobs, high concurrencies*
- **Is any form of stress testing indicated for the feature?**
  - *Does the feature have any thread interactions, locking or concurrency mechanisms?*

Testing Plan

This section identifies the testing that will be performed based on the risks identified above

Additional MTR Tests

Describe any MTR tests that will be implemented in addition to the ones already present in the patch

RQG Tests

- **Are new Random Query Generator grammars required?**
  - *If existing grammars do not cover the new feature*
- **Are new Validators or Reporters required?**
  - *If the existing RQG validation code can not verify the proper operation of the feature*
- **RQG tests lines to run:**
  - *provide actual RQG command lines, along with a description of the desired effect*

Manual Testing

Describe any manual testing that will be performed involving connectors, clients or installers

Benchmarks and Stress Tests

Describe any benchmarks and stress tests that will be performed. Include the exact parameters and command lines that will be used

Hand-Off

This section identifies final checks to be performed on the test content when it is delivered.

Requirements for MTR Tests

- Are all new mysqld options, `SHOW STATUS` variables, `I_S`[51] tables and such covered with an MTR test?
- Are all new error messages covered with a test?
- Is code coverage acceptable to all parties involved?

Requirements for Random Query Generator Tests

- Has the proper set of RQG grammars been chosen or created?
- Do we have a .CC file listing all interesting mysqld options and RQG variants, in order to run a combinations test? Was the CC file pushed into RQG's LP repository?
- Has an at least 24-hour combination test been run?
- Was code coverage run on the RQG test?
- Were all new grammars and Perl modules pushed into the RQG LP repository?
- Were the RQG tests prepared to be buildbot-ready, as opposed to manually-monitored?
- Does the test include any safeguards against false negatives?
  - *e.g. all queries generated are bad, which causes no actual replication, which is still reported as test success*
- Are the tests running stably and green in the feature tree's BuildBot?
- Are any bug reports missing reproducible test cases, core files, RQG command lines and the like?

Requirements for Code Coverage

This makes it much faster to review code as one knows what it tested and what one needs to review more carefully

- Ideally all code should be tested by MTR;
- If code can only be reproduced by an RQG test or other external test, sufficient information must be provided in the Worklog for the test to be reproducible;
- All code should either be tested or reviewed and marked with `/* purecov inspected */`
- Code that is suspected to be unreachable should have an DBUG_ASSERT(0) and be marked with /* purecov: deadcode */.
- Was an MTR code coverage report for the feature tree generated by i7.stoev.org/lcov?
- Has the dgcov coverage tool been run?
- Are there any notable regressions in the code coverage?
- Was code coverage run on the RQG tests alone, along with an effort to increase it?
- Is the code covered by comments?

Requirements for Code Trees

- Was the stable tree merged **into** the feature tree recently?
- Were all RQG tests pushed into lp:randgen and documented on the RQG manual pages?
- Were all RQG or other automatable tests installed in BuildBot?
- Is the feature tree BuildBot green?

Requirements for Closing the Worklog as Complete

- Was the Worklog updated with information on the testing performed?
- Was the QA check box in the Worklog ticked?

- Were all related bugs on Launchpad closed? This includes A) bugs that were tagged to belong to the feature tree, B) bugs assigned to the developer regardless of tree, C) bugs assigned to the tester and D) and orphan bugs just hanging around the same theme or time frame;
- Did the WL complete the entire review procedure, including any back-and-forth emails?
- Has the new feature been documented?

Random Query Generator Tests

> **Note:**
>
> This page contains background information for MariaDB developers.

PQuery is currently in development to perform random query generation.

The documentation for the Random Query Generator is available here.

The latest RQG used by MariaDB can be found at:

- https://github.com/elenst/rqg/tree/master
- https://github.com/MariaDB/randgen/tree/master

The list of automatic tests is located in the `buildbot.conf` file in the `mariadb.org-tools` repository.

RQG Extensions for MariaDB

> **Note:**
>
> This page contains background information for MariaDB developers.

All recent reasonably stable changes can be found in our Github repository. The link points to the master branch; there are other branches created for more specific cases.

While all described changes were made in order to test MariaDB code, many of them are applicable to other MySQL flavors as well.

Galera Mode

A set of changes to support running RQG tests with multi-master Galera replication, implemented to test MariaDB Galera Cluster.

The top-level script `runall-new.pl` got a new option `--galera`, which takes a string value. The string can be a combination of `'m'` or `'s'`, where each symbol represents a Galera node. `'m'` stands for `'master'`, and `'s'` stands for `'slave'`.

The new module `GaleraMySQLd.pm` implements cluster initialization and startup. It is only interested in the number of nodes.

Internals are adapted to the multi-master or mixed mode:

- Instead of executing data generation on each started server, it is only executed on the first master.
- Test flow is executed on each master (but not on slaves).
- No result comparison is performed after each query, the flow runs independently, but, in the end, if no other errors were encountered, `runall-new.pl` performs dump comparison in the usual manner.

Also, a sample grammar and data template are provided in `conf/galera`, they are slightly modified versions of `conf/engines/engine_stress.yy` and `engine_stress.zz`, adapted for Galera taking into account its limitations (e.g. no `LOCK`).

Note: `GaleraMySQLd.pm` has defaults for everything mandatory but `wsrep_provider`. If you run the test with more than 1 node, you need to provide the value on the command line in the usual manner (`--mysqld=--wsrep-provider=...`), otherwise the test fails with the corresponding error message.

So, if you provide the following option:

```
--galera=mms --mysqld=--wsrep-provider=<path to Galera library>
```

3 nodes will be started, and Galera replication will be set up between them; the data will be generated on the first node; the test flow will be executed on the first and second nodes; at the end of the test, data dump from each node will be taken and compared; node vardirs will be placed under `<vardir>/node0`, `<vardir>/node1`, `<vardir>/node2`.

CheckFieldValue Validator

A grammar can set requirements on results of a query through a specifically formatted comment. If the validator finds a comment which matches the template, it performs the requested check. The validation is defined in the comment itself: it says which field in which row in the result set should be checked, and provides the condition (currently simple numeric comparisons: `=`, `<`, `>`, `<=`, `>=`).

It allows to do simple verification without implementing a special validator.

Example:

A query in the grammar file

```
  SELECT COUNT(*), MAX(`pk`) FROM _table /* Validate 2 > 10 for row all*/;
```

The comment means “Check that the value in field 2 is greater than 10 for all rows” (for this query “all rows” is overkill, it could just as well be “row 1”).

Assuming that there is a table with not more than 10 rows, the validator will produce the error:

```
ERROR: For query 'SELECT COUNT(*), MAX(`pk`) FROM `BB` /* Validate 2 > 10 for row 1*/' on row 1 result 10
does not meet the condition > 10
Full row: [1] : 1; [2] : 10;
```

The exit code for this failure is `STATUS_REQUIREMENT_UNMET`.

Usage example: investigation of the sporadic failure MDEV-4578.

MariadbGtidCrashSafety Reporter

The reporter was created to test slave crash-safety with MariaDB implementation of GTID. It is similar to SlaveCrashRecovery reporter, but is adjusted to check GTID-specific aspects:

- It restarts the slave with `--skip-slave-start`, and executes these statements:

```
CHANGE MASTER .. MASTER_USE_GTID=current_pos;
STOP SLAVE;
```

So, regardless how the replication was set up initially, after the first crash or restart, it starts using GTID for sure, while the slave is running, and also before a crash and after restart the reporter checks `gtid*` variables and the contents of the system table `mysql.gtid_slave_pos` and verifies basic consistency of the data, e.g. watches that GTID `seq_no` constantly grows.

SlaveCrashRecovery Reporter

The reporter can be used to test crash safety of replication.

It is a periodic reporter, every 30 seconds it kills the slave server using `SIGKILL`, and immediately restarts it on the old data directory, with the same parameters as before. On server restart, the reporter checks that the server and the replication started all right.

The reporter itself does not check consistency of the data, but it can be used together with `ReplicationConsistency` reporter.

It is supposed to be used with `runall-new.pl`, so that the server is started without MTR involvement.

Usage example: testing of GTID in MariaDB.

BinlogConsistency Reporter

The reporter checks that the contents of the binary log correctly reflects the contents of the server.

After the main test flow is finished, the reporter creates a data dump of the server, stores its binary logs, shuts down the server, starts a new one with the same parameters, but on a clean data directory, replays the binary logs into it, creates a dump of the new server, and compares two dumps.

It is to be used with `runall-new.pl`.

Usage example: testing of binlog changes in MariaDB 10.0 (e.g. MDEV-181, MDEV-232)

CrashRecovery Reporter

The idea is very much the same as in the old Recovery reporter: crash the server at the end of the test, restart it and make sure it started all right, and the data is not corrupted. The main difference is that the old reporter restarts the server in a hardcoded pre-defined manner, which limits its use. Instead, CrashRecovery reporter starts the server with the same set of options as the initial one, which imitates a more realistic scenario, and also allows to use it on non-default InnoDB configurations.

It is to be used with `runall-new.pl` .

LimitRowsExamined Transformer

The transformer was developed for testing the LIMIT ROWS EXAMINED functionality added in MariaDB 5.5. It can be used in the usual way, by providing its name in the `--transformers` list.

The transformer checks whether the original query already contains a `ROWS EXAMINED` clause. If it does not, it adds the clause either after the `LIMIT` clause, or at the end of the query. In any case (even if `ROWS EXAMINED` was already there), the transformer returns the following sequence of statements:

- `FLUSH STATUS`
- <the query with `ROWS EXAMINED`>
- <a query which sums up status variables related to examined rows>

The result of the main query is checked to be a subset of the original query's result set. The sum of status variables is checked to be not greater than the limit provided in the `ROWS EXAMINED` clause, plus a margin. The margin is configured in the transformer.

If the result of the transformed query appears not to be a subset of the original result set, `STATUS_LENGTH_MISMATCH` is returned.

If the sum of status variables is greater than the maximum allowed value, `STATUS_REQUIREMENT_UNMET` is returned.

Note: Status values `STATUS_REQUIREMENT_UNMET` and `STATUS_REQUIREMENT_UNMET_SELECT` were added to `Constants.pm`.

ShowExplain Validator

The validator was developed for testing SHOW EXPLAIN.

The validator checks that the output of `SHOW EXPLAIN` correlates with the output of traditional `EXPLAIN` executed for the same query. It also tries to filter out known expected mismatches between the produced plans.

Comparison of VIEW Algorithms

RQG already provided `--views[=<view type>]` option, which means that in addition to the normal data generation, views of the requested types will be added and used in the test flow. However, you could only create views of the same type on servers that you were comparing. Now there are `--views1` and `--views2` options, which work the same way as `--basedir1` / `--basedir2`, `--mysqld1` / `--mysqld2`, etc. The backward compatibility is preserved, so you can still use `--views` which will be applied to both servers unless there is `--views1` or `--views2` to override it.

The change was made in `gentest.pl` and both `runall.pl` and `runall-new.pl`.

Usage example: testing of MERGE view extension in MariaDB 10.0 (MDEV-3862)

Multiple Redefining Grammars

RQG allows to provide `--redefine=<grammar file>` option to override or add rules to the main grammar. Sometimes you have a redefining grammar for a feature, and another redefining grammar for an engine, and yet another redefining grammar for a specific version, and combining them makes the number of grammars to grow uncontrollably. The simple change has been made to allow providing several redefining grammars at once, for instance:

```
runall.pl ... --redefine=memory_engine_redefine.yy --redefine=binlog_format_stmt_redefine.yy --
redefine=legacy_version_redefine.yy
```

> **Warning:**
>
> It is better not to allow them to override each other, since the result can be unexpected (that is, they should define different sets of rules).

The change was made in `gentest.pl` and both `runall.pl` and `runall-new.pl`.

Keywords _basetable and _view

The RQG keyword `_table` means any table or view from the test dataset. Often it's good enough, but sometimes it badly increases the number of erroneous statements. Now tables and views can be differentiated in a grammar depending on what the goal is: `_table` can still be used for both tables and views, while _basetable will only pick tables, and _view will only pick views.

Example: If you create the following rule in your grammar:

```
alter:
        ALTER TABLE _table ENGINE=MyISAM;
```

When you are running the test with views, you get lots of `ER_WRONG_OBJECT` errors ("is not BASE TABLE"). This is hardly the goal, so you can improve the grammar by changing it to this:

```
alter:
        ALTER TABLE _basetable ENGINE=MyISAM;
```

That way, the rule only picks "real" tables. Of course, if you still want to pick views sometimes, as a sanity check that there is no crash or anything, you can make the rule a bit more complicated, but much better tuned than it was:

```
alter:
        ALTER TABLE alter_object ENGINE=MyISAM;

alter_object:
        _basetable | _basetable | _basetable | _basetable | _basetable | _view ;
```

Benchmark Builds

Benchmarking Aria

We have not yet had time to benchmark Aria properly. Here follows some things that have been discussed on the maria-discuss email list.

Aria used for internal temporary tables

By default Aria (instead of MyISAM) is used for the internal temporary tables when MEMORY tables overflows to disk or MEMORY tables can't be used (for example when you are using temporary results with BLOB's).
In most cases Aria should give you better performance than using MyISAM, but this is not always the case.

```
CREATE TABLE `t1` (`id` INT(11) DEFAULT NULL, `tea` TEXT)
  ENGINE=MyISAM DEFAULT CHARSET=latin1;
INSERT t1 SELECT rand()*2e8, repeat(rand(), rand()*64) FROM t1;
```

Repeat the last row until you get 2097152 rows.

The queries tested

```
Q1: SELECT id, tea from t1 group by left(id,1) order by null;
Q2: SELECT id, count(*), tea from t1 group by left(id,1) order by null;
Q3: SELECT id, tea from t1 group by left(id,2) order by null;
Q4: SELECT id, count(*), tea from t1 group by left(id,2) order by null;
Q5: SELECT id, tea from t1 group by id % 100 order by null;
Q6: SELECT id, count(*), tea from t1 group by id % 100 order by null;
```

Results (times in seconds, lower is better):

Test	Aria 8K page size	Aria 2K page size	MyISAM
Q1	3.08	2.41	2.17
Q2	6.24	5.21	12.89
Q3	4.87	4.05	4.04
Q4	8.20	7.04	15.14
Q5	7.10	6.37	6.28
Q6	10.38	9.09	17.00

The good news is that for common group by queries that is using summary functions there is a close to 50 % speedup of using Aria for internal temporary tables.

Note that queries Q1,Q3 and Q5 are not typical queries as there is no sum functions involved. In this case rows are just written to the tmp tables and there is no updates. As soon as there are summary functions and updates the new row format in Aria gives a close to 50 % speedup.

The above table also shows how the page size (determined by the aria_block_size system variable) affects the performance.
The reason for the difference is that there is more data to move back/from the page cache for inserting of keys. (When reading data we are normally not copying pages). The bigger page size however allows longer keys and fewer index levels so for bigger data sets the different should be smaller. It's possible to in the future optimize Aria to not copy pages from the page cache also for index writes and then this difference should disappear.

The default page size for Aria is 8K.

If you want to run MariaDB with MyISAM for temporary tables, don't use the configure option '–with-aria-tmp-tables' when building MariaDB.

DBT3 Automation Scripts

DBT-3 (OSDL Database Test 3) is a workload tool for the Linux kernel that OSDL
(Open Source Development Labs, inc) developed based on TPC-H which is provided by the Transaction Performance Processing Council (TPC).

DBT-3, like TPC-H, simulates an actual decision-making support system and models complex business analysis applications that perform data processing jobs for making better business decisions. By running the workload that DBT-3 simulates, it is possible to verify and measure the performances of the Linux kernel in an actual decision-making support system.

DBT-3 uses the “scale factor (SF)” as a stress indicator of the system. By varying the SF, it becomes possible to make the size of a database the SF times its size.

The tests performed by DBT-3 comprise the three tests listed below. DBT-3 obtains the execution times of these three tests as well as the system status information and database statistics information.

1. Load test

- Enters the data to be used for the Power and Throughput tests into the database. Makes a bulk insert of the huge CSV data corresponding to the scale factor into the database.

1. Power test

- Performs 22 complex queries.

1. Throughput test

- Performs the same 22 queries as in the Power test simultaneously in more than one process.

For the purpose of this task, only the Power test is performed over preliminary
prepared database with various Scale factors. The time for each query execution
will be measured and stored into a database. Later the results of one whole
test with all 22 queries will be rendered into a histogram graphics comparing
it to different configurations.

Benchmark environment preparation

sudo rights

The user that will run the benchmark must have sudo rights on the machine.

For clearing the system caches between query runs, the automation script uses the following command:

```
sudo /sbin/sysctl vm.drop_caches=3
```

This command must be run with superuser rights. Even if a user supplies a password to sudo, this password expires after some timeout. In order for this command to be run without requiring password, the following line should be added to the sudoers file (edit it with the `"sudo visudo"` command):

```
'your_username' ALL=NOPASSWD:/sbin/sysctl
```

…where `'your_username'` is the user that will run the benchmark.

Required software

The automated DBT3 benchmark requires the following software:

- Perl
  - Project home:
- mariadb-tools
  - Project home: mariadb-tools
  - The project folder is called "`dbt3_benchmark`" and is under `mariadb-tools`.
- dbt3-1.9
  - Download location:
- Gnuplot 4.4 — graphics output program.
  - Project home:
- Config::Auto — a Perl module that reads configuration files. To install it use the following command:

```
sudo cpan Config::Auto
```

- DBD::mysql — a Perl module to connect to MariaDB/MySQL and PostgreSQL. To install it use the following command:

```
sudo cpan DBD::mysql
```

NOTE: You may receive an error saying that CPAN could not find `mysql_config`. In this case you have to install the mysql client development library. In OpenSuse the command is:

```
sudo zypper install libmysqlclient-devel
```

Alternatively this module can be installed manually by following these steps:

1. Download DBD-mysql-4.020.tar.gz from mysql.pm and unpack it
2. Run the perl script PerlMake.pl under the unzipped dir:

```
perl Makefile.PL --mysql_config=/path/to/some/mysql_binary_distribution/bin/mysql_config
```

1. Run `make` to compile `DBD::mysql`:

```
make
```

1. Add the necessary paths in order to run `DBD::mysql`:

```
export PERL5LIB="/path/to/unzipped_DBD_mysql/DBD-mysql-4.020/lib"
export LD_LIBRARY_PATH="/path/to/unzipped_DBD_mysql/DBD-mysql-
4.020/blib/arch/auto/DBD/mysql/:/path/to/some/mysql_binary_distribution/lib/"
```

Tested DBMS

- MySQL 5.5.x
  - Download location: #downloads →
    Generally Available (GA) Releases → Linux - Generic 2.6 (x86, 64-bit),
    Compressed TAR Archive - downloads mysql-5.5.x-linux2.6-x86_64.tar.gz - gzipped tar file for Linux x86
- MySQL 5.6.x
  - Download location: #downloads →
    Development Releases → Linux - Generic 2.6 (x86, 64-bit), Compressed TAR
    Archive - downloads mysql-5.6.x-m5-linux2.6-x86_64.tar.gz - gzipped tar file for Linux x86
- MariaDB 5.3.x

    - Download location: 5.3 , downloaded with Bazaar:

```
bzr branch lp:maria/5.3
```

- MariaDB 5.5.x
    - Download location: 5.5 , downloaded with Bazaar:

```
bzr branch lp:maria/5.5
```

- PostgreSQL
    - Download location:

NOTE: The DBT3 benchmark requires a lot of disk space (for example MySQL 5.5.x + MyISAM database with scale factor 30 takes about 50 GB). Also some queries require the utilization of temp tables under the directory set by the `--tmpdir` startup parameter passed to `mysqld`. In the prepared configuration files the temp directory is pointed to the `mysql` system directory of the binary distribution, but one should reassure that there is enough free space available for the temp directory.

Installation instructions

NOTE: The directory where all the files will be downloaded or installed will be referred as `$PROJECT_HOME`. This could be for example `~/benchmark/dbt3`.

Download **mariadb-tools**

1. Go to your project folder

```
cd $PROJECT_HOME
```

1. Get the latest branch from LaunchPad with Bazaar:

```
bzr branch lp:mariadb-tools
```

Now the project for the dbt3 benchmark test will be in the following dir:

```
$PROJECT_HOME/mariadb-tools/dbt3_benchmark/
```

The project `dbt3_benchmark` has the following directories and files:

- config — a folder where the configuration files for MariaDB, MySQL and PostgreSQL are stored. They are divided into subfolders named ‘`sXX`’, where `XX` is the scale factor.
- dbt3_mysql — a folder with all the necessary files for preparing DBT3 databases and queries for the tests with MySQL and
  MariaDB
- tests — a folder where the different test configurations are stored. It contains the following directories:
    - db_conf — here are stored the database configuration files
    - queries_conf — here are stored the different queries configuration files
    - results_db_conf — here is stored the configuration of the results database
    - test_conf — here are the test configurations
    - launcher.pl — a perl script that automates the test. Details about calling and functionality of this file are listed later on this page.

Prepare benchmark workload and queries

For the purpose of the benchmark from DBT3-1.9 we will only need **DBGEN** and **QGEN**. DBGEN is a tool that generates a workload for the test and QGEN is a tool that generates the queries used for the test.

1. Go to
2. Download the archive for DBT3 1.9 into your project folder $PROJECT_HOME
3. Unzip the archive into your project folder

```
cd $PROJECT_HOME
tar -zxf dbt3-1.9.tar.gz
```

1. Copy the file tpcd.h into the dbt3 folder. This step includes the necessary labels for MySQL/MariaDB when building queries.

```
cp $PROJECT_HOME/mariadb-tools/dbt3_benchmark/dbt3_mysql/tpcd.h $PROJECT_HOME/dbt3-1.9/src/dbgen/
```

1. Copy the file Makefile under `$PROJECT_HOME/mariadb-tools/dbt3_benchmark/dbt3_mysql/` into the dbt3 folder

- NOTE: This step is executed only if you want to overwrite the default behavior of PostgreSQL settings. After copying this Makefile and building the project, QGEN will be set to generate queries for MariaDB/MySQL. If you skip this step, QGEN will generate queries for PostgreSQL by default.

```
cp $PROJECT_HOME/mariadb-tools/dbt3_benchmark/dbt3_mysql/Makefile $PROJECT_HOME/dbt3-1.9/src/dbgen/
```

1. Go to $PROJECT_HOME/dbt3-1.9/src/dbgen and build the project

```
cd $PROJECT_HOME/dbt3-1.9/src/dbgen
make
```

1. Set the variable DSS_QUERY to the folder with template queries for MariaDB/MySQL or for PostgreSQL
2. If you want to build the queries that fit MariaDB/MySQL dialect execute the following command:

```
export DSS_QUERY=$PROJECT_HOME/mariadb-tools/dbt3_benchmark/dbt3_mysql/mysql_queries/
```

1. If you want to use the default PostgreSQL templates, execute the following command:

```
export DSS_QUERY=$PROJECT_HOME/dbt3-1.9/queries/pgsql/
```

1. Create a directory to store the generated queries in

```
mkdir $PROJECT_HOME/gen_query
```

1. Generate the queries

NOTE: The examples use scale factor 30. If you want different scale, change the value of `-s` parameter

-

cd $PROJECT_HOME/dbt3-1.9/src/dbgen
./qgen -s 30 1 > $PROJECT_HOME/gen_query/s30-m/1.sql
./qgen -s 30 2 > $PROJECT_HOME/gen_query/s30-m/2.sql
./qgen -s 30 3 > $PROJECT_HOME/gen_query/s30-m/3.sql
./qgen -s 30 4 > $PROJECT_HOME/gen_query/s30-m/4.sql
./qgen -s 30 5 > $PROJECT_HOME/gen_query/s30-m/5.sql
./qgen -s 30 6 > $PROJECT_HOME/gen_query/s30-m/6.sql

./qgen -s 30 7 > $PROJECT_HOME/gen_query/s30-m/7.sql
./qgen -s 30 8 > $PROJECT_HOME/gen_query/s30-m/8.sql
./qgen -s 30 9 > $PROJECT_HOME/gen_query/s30-m/9.sql
./qgen -s 30 10 > $PROJECT_HOME/gen_query/s30-m/10.sql
./qgen -s 30 11 > $PROJECT_HOME/gen_query/s30-m/11.sql
./qgen -s 30 12 > $PROJECT_HOME/gen_query/s30-m/12.sql
./qgen -s 30 13 > $PROJECT_HOME/gen_query/s30-m/13.sql
./qgen -s 30 14 > $PROJECT_HOME/gen_query/s30-m/14.sql
./qgen -s 30 15 > $PROJECT_HOME/gen_query/s30-m/15.sql
./qgen -s 30 16 > $PROJECT_HOME/gen_query/s30-m/16.sql
./qgen -s 30 17 > $PROJECT_HOME/gen_query/s30-m/17.sql
./qgen -s 30 18 > $PROJECT_HOME/gen_query/s30-m/18.sql
./qgen -s 30 19 > $PROJECT_HOME/gen_query/s30-m/19.sql
./qgen -s 30 20 > $PROJECT_HOME/gen_query/s30-m/20.sql
./qgen -s 30 21 > $PROJECT_HOME/gen_query/s30-m/21.sql
./qgen -s 30 22 > $PROJECT_HOME/gen_query/s30-m/22.sql

```
1. Generate the explain queries
```

./qgen -s 30 -x 1 > $PROJECT_HOME/gen_query/s30-m/1_explain.sql
./qgen -s 30 -x 2 > $PROJECT_HOME/gen_query/s30-m/2_explain.sql
./qgen -s 30 -x 3 > $PROJECT_HOME/gen_query/s30-m/3_explain.sql
./qgen -s 30 -x 4 > $PROJECT_HOME/gen_query/s30-m/4_explain.sql
./qgen -s 30 -x 5 > $PROJECT_HOME/gen_query/s30-m/5_explain.sql
./qgen -s 30 -x 6 > $PROJECT_HOME/gen_query/s30-m/6_explain.sql
./qgen -s 30 -x 7 > $PROJECT_HOME/gen_query/s30-m/7_explain.sql
./qgen -s 30 -x 8 > $PROJECT_HOME/gen_query/s30-m/8_explain.sql
./qgen -s 30 -x 9 > $PROJECT_HOME/gen_query/s30-m/9_explain.sql
./qgen -s 30 -x 10 > $PROJECT_HOME/gen_query/s30-m/10_explain.sql
./qgen -s 30 -x 11 > $PROJECT_HOME/gen_query/s30-m/11_explain.sql
./qgen -s 30 -x 12 > $PROJECT_HOME/gen_query/s30-m/12_explain.sql
./qgen -s 30 -x 13 > $PROJECT_HOME/gen_query/s30-m/13_explain.sql
./qgen -s 30 -x 14 > $PROJECT_HOME/gen_query/s30-m/14_explain.sql
./qgen -s 30 -x 15 > $PROJECT_HOME/gen_query/s30-m/15_explain.sql
./qgen -s 30 -x 16 > $PROJECT_HOME/gen_query/s30-m/16_explain.sql
./qgen -s 30 -x 17 > $PROJECT_HOME/gen_query/s30-m/17_explain.sql
./qgen -s 30 -x 18 > $PROJECT_HOME/gen_query/s30-m/18_explain.sql
./qgen -s 30 -x 19 > $PROJECT_HOME/gen_query/s30-m/19_explain.sql
./qgen -s 30 -x 20 > $PROJECT_HOME/gen_query/s30-m/20_explain.sql
./qgen -s 30 -x 21 > $PROJECT_HOME/gen_query/s30-m/21_explain.sql
./qgen -s 30 -x 22 > $PROJECT_HOME/gen_query/s30-m/22_explain.sql

```
Now the generated queries for MariaDB/MySQL test are ready and are stored into
the folder `$PROJECT_HOME/gen_query/s30-m/` (-m is for MariaDB/MySQL).

Additional reorganization of directories is up to the user.

1. Create a directory for the generated workload
```

mkdir $PROJECT_HOME/gen_data/s30

```
1. Set the variable DSS_PATH to the folder with the generated table data. The generated workload for the
test will be generated there.
```

export DSS_PATH=$PROJECT_HOME/gen_data/s30/

```
1. Generate the table data

* NOTE: The example uses scale factor = `30`. If you want to change it, you should change the parameter
`-s`.
```

./dbgen -vfF -s 30

```
* Now the generated data load is stored into the folder set in `$DSS_PATH = $PROJECT_HOME/gen_data/`

For the purpose of this benchmark these steps have been performed for scale
factor 30 and are stored on facebook-maria1 in the following locations:

* `/benchmark/dbt3/gen_data/s30` – the data load for scale factor 30
* `/benchmark/dbt3/gen_query/s30-m` – generated queries for MariaDB/MySQL with scale factor 30
* `/benchmark/dbt3/gen_query/s30-p` – generated queries for PostgreSQL with scale factor 30

See [DBT3 example preparation time](#pg-long-running-tests-benchmarks-dbt3-example-preparation-time-
fbaf8d27) to see how long it would take you to
prepare the databases for the test.

###### Download [MySQL 5.5.x](https://dev.mysql.com/downloads/mysql/#downloads)

1. Download the tar.gz file into your project folder `$PROJECT_HOME/bin/` for example

1. Unzip the archive with the following command:
```

gunzip < mysql-5.5.x-linux2.6-x86_64.tar.gz |tar xf -

```
Now the server could be started with the following command:
```

$PROJECT_HOME/bin/mysql-5.5.x-linux2.6-x86_64/bin/mysqld_safe –datadir=some/data/dir &

```
###### Download [MySQL 5.6.x](https://dev.mysql.com/downloads/mysql/#downloads)

1. Download the tar.gz file into your project folder `$PROJECT_HOME/bin/` for example

1. Unzip the archive with the following command:
```

gunzip < mysql-5.6.x-m5-linux2.6-x86_64.tar.gz |tar xf -

```
Now the server could be started with the following command:
```

$PROJECT_HOME/bin/mysql-5.6.x-m5-linux2.6-x86_64/bin/mysqld_safe –datadir=some/data/dir &

```
###### Download and build [MariaDB 5.3](https://mariadb.com/docs/release-notes/community-server/old-
releases/5.3/changes-improvements-in-mariadb-5-3).x / [MariaDB 5.5](https://mariadb.com/docs/release-
notes/community-server/old-releases/5.5/changes-improvements-in-mariadb-5-5).x

**NOTE:** These steps are the same for [MariaDB 5.5](https://mariadb.com/docs/release-notes/community-
server/old-releases/5.5/changes-improvements-in-mariadb-5-5).x with properly replaced
version numbers

1. Download with Bazaar the [mariadb 5.3](https://mariadb.com/docs/release-notes/community-server/old-
releases/5.3/changes-improvements-in-mariadb-5-3) project
```

bzr branch lp:maria/5.3
mv 5.3/ mariadb-5.3

```
1. Build MariaDB
```

cd mariadb-5.3/
./BUILD/compile-amd64-max

```
1. Build a binary distribution tar.gz file
```

./scripts/make_binary_distribution

```
1. Move the generated tar.gz file and unzip it to $PROJECT_HOME/bin from where
 it will be used by the automation script
```

mv mariadb-5.3.x-beta-linux-x86_64.tar.gz $PROJECT_HOME/bin/
cd $PROJECT_HOME/bin/
tar -xf mariadb-5.3.x-beta-linux-x86_64.tar.gz

```
Now the server could be started with the following command:
```

$PROJECT_HOME/bin/mariadb-5.3.x-beta-linux-x86_64/bin/mysqld_safe –datadir=some/data/dir &

```
###### Prepare the databases for the benchmark

**NOTE:** These instructions are the same for MariaDB, MySQL 5.5.x and MySQL
5.6.x with changing only the database home folders, noted here as $DB_HOME (for
example for MySQL 5.5.x $DB_HOME is
`$PROJECT_HOME/bin/mysql-5.5.x-linux2.6-x86_64`). Also you can prepare InnoDB
storage engine test databases. Instructions for preparing PostgreSQL could be
found in the section for downloading, building and preparing PostgreSQL later
on this page.

1. Open the file `$PROJECT_HOME/mariadb-tools/dbt3_benchmark/dbt3_mysql/make-dbt3-db_innodb.sql` and edit
the values for the call of the sql commands that look like this one:
```

LOAD DATA INFILE ‘/some/path/to/gen_data/nation.tbl’ into table nation fields terminated by ‘|’;

```
* They all look the same but operate with different tables.

* Replace "/some/path/to/gen_data/" with the proper directory where the
 generated data load is stored. At the end the same command could look like
 this:
```

LOAD DATA INFILE '~/benchmark/dbt3/gen_data/s30/nation.tbl' into table nation fields terminated by '|';

```
1. Create an empty MySQL database into a folder that will be used for the benchmark
```

cd $DB_HOME
./scripts/mysql_install_db –defaults-file=$PROJECT_HOME/mariadb-tools/dbt3_benchmark/config/s30/load_mysql_myisam_my.cnf –basedir=$DB_HOME –datadir=$PROJECT_HOME/db_data/myisam-s30/

```
* NOTE: For InnoDB change the defaults-file to `load_mysql_innodb_my.cnf`.

1. Start the mysqld process`./bin/mysqld_safe --defaults-file=$PROJECT_HOME/mariadb-
tools/dbt3_benchmark/config/s30/load_mysql_myisam_my.cnf --tmpdir=$PROJECT_HOME/temp/ --
socket=$PROJECT_HOME/temp/mysql.sock --datadir=$PROJECT_HOME/db_data/myisam-s30/ &`

* NOTE: For InnoDB change the defaults-file to `load_mysql_innodb_my.cnf`.
 Also make sure that you have enough space in the directory set by the
 parameter `--tmpdir`, since loading the database could take a
 lot of temporary space.

1. Load the data into the database by executing the file `make-dbt3-db_pre_create_PK.sql` (for InnoDB) or
`make-dbt3-db_post_create_PK.sql` (for MyISAM)`./bin/mysql -u root -S $PROJECT_HOME/temp/mysql.sock <
$PROJECT_HOME/mariadb-tools/dbt3_benchmark/dbt3_mysql/make-dbt3-db_post_create_PK.sql`

* NOTE: For faster creation, it is recommended to
 use `make-dbt3-db_pre_create_PK.sql` for loading InnoDB
 and `make-dbt3-db_post_create_PK.sql` for loading MyISAM databases.

1. Shutdown the database server:
```

./bin/mysqladmin –user=root –socket=$PROJECT_HOME/temp/mysql.sock shutdown 0

```
Now you have a database loaded with scale 30. Its datadir is
`$PROJECT_HOME/db_data/myisam-s30/`

The same steps can be reproduced for different scale factors and for different
storage engines.

###### Download, build and prepare [PostgreSQL](https://www.postgresql.org/ftp/source/)

1. Go to [](https://www.postgresql.org/ftp/source/v9.1rc1/)

1. Download the file under the link postgresql-9.1rc1.tar.gz

1. Unzip the archive to your project folder
```

gunzip < postgresql-9.1rc1.tar.gz |tar xf -

```
1. Execute the following commands into the shell to install PostgreSQL:
```

mkdir $PROJECT_HOME/PostgreSQL_bin
cd $PROJECT_HOME/postgresql-9.1rc1
./configure –prefix=$PROJECT_HOME/bin/PostgreSQL_bin
make
make install

```
* NOTE: Configure script may not find the following libraries: readline
 and zlib. In that case you can run configure without these libraries by
 adding the following parameters to the command line:
 `--without-readline --without-zlib`

1. Prepare the database to test with:
```

mkdir $PROJECT_HOME/db_data/postgre_s30
cd $PROJECT_HOME/bin/PostgreSQL_bin
./bin/initdb -D $PROJECT_HOME/db_data/postgre_s30

```
1. Start the server:
```

./bin/postgres -D $PROJECT_HOME/db_data/postgre_s30 -p 54322 &

```
1. Load the dataload into the DB
```

./bin/createdb -O {YOUR_USERNAME} dbt3 -p 54322
./bin/psql -p 54322 -d dbt3 -f $PROJECT_HOME/mariadb-tools/dbt3_benchmark/dbt3_mysql/make-dbt3-db_pg.sql

```
* NOTE: Here under `{YOUR_USERNAME}` you should put the
 database owner.

1. Stop the server:
```

./bin/pg_ctl -D $PROJECT_HOME/db_data/postgre_s30/ -p 54322 stop

```
The steps for preparing the workload for the benchmark on facebook-maria1 are
already made for MariaDB, MySQL and PostgreSQL. Here are the directories for
the different DBMS, storage engines and scale factors that are prepared on
facebook-maria1:

* `~/benchmark/dbt3/db_data/myisam_s30`
— datadir for MariaDB/MySQL + MyISAM with scale
 factor 30

* `~/benchmark/dbt3/db_data/innodb_mariadb_s30`
— datadir for MariaDB + InnoDB with scale factor 30
 (TODO)

* `~/benchmark/dbt3/db_data/innodb_mysql_s30`
— datadir for
 MySQL + InnoDB with scale factor 30 (TODO)

* `~/benchmark/dbt3/db_data/postgre_s30`
— datadir for
 PostgreSQL with scale factor 30 (TODO)

###### Prepare the results database

The results of the benchmark will be stored in a separate database that will be
run by [MariaDB 5.3](https://mariadb.com/docs/release-notes/community-server/old-releases/5.3/changes-
improvements-in-mariadb-5-3).x.

**NOTE:** The results database will be a subject to change in future versions
of the DBT3 benchmarking project.

The database is created by the file
`$PROJECT_HOME/mariadb-tools/dbt3_benchmark/dbt3_mysql/make-results-db.sql`.
In that file you can find details about every table and column in the database.

To prepare the database for work follow these steps:

1. Go to [MariaDB 5.3](https://mariadb.com/docs/release-notes/community-server/old-releases/5.3/changes-
improvements-in-mariadb-5-3).x installation directory
```

cd $PROJECT_HOME/bin/mariadb-5.3.x-beta-linux-x86_64

```
1. Install the system database tables into the datadir for the results (for
example `$PROJECT_HOME/db_data/dbt3_results_db`)
```

./scripts/mysql_install_db –datadir=$PROJECT_HOME/db_data/dbt3_results_db

```
1. Start mysqld for results db
```

./bin/mysqld_safe –defaults-file=$PROJECT_HOME/mariadb-tools/dbt3_benchmark/config/results_mariadb_my.cnf
–port=12340 –socket=$PROJECT_HOME/temp/mysql_results.sock
–datadir=$PROJECT_HOME/db_data/dbt3_results_db/ &

```
1. Install the database
```

./bin/mysql -u root -P 12340 -S $PROJECT_HOME/temp/mysql_results.sock < $PROJECT_HOME/mariadb-
tools/dbt3_benchmark/dbt3_mysql/make-results-db.sql

```
1. Shutdown the results db server:
```

```
./bin/mysqladmin –user=root –port=12340 –socket=$PROJECT_HOME/temp/mysql_results.sock shutdown 0
```

```
###### Automation script

###### Configuring and running a benchmark

In order to run a benchmark, one should have:

* 5 configuration files:

  1. DBMS server configuration (see [#dbms-server-configuration](#dbms-server-configuration))
  1. Test configuration (see [#test-configuration](#test-configuration))
  1. Queries configuration (see [#queries-configuration](#queries-configuration))
  1. Results database configuration (see [#results-database-configuration](#results-database-
configuration))
  1. Top-level configuration file that combines all of the above (see
 [#top-level-configuration](#top-level-configuration))
* an automation script `launcher.pl` that could be found
 under `mariadb-tools/dbt3_benchmark/`
* startup parameters that should be passed to the automation script (see
 [#script-startup-parameters](#script-startup-parameters)).

Details about each of these is given in the following sections.

Each benchmark is configured by a set of configuration files. One can find
example (default) configuration files under the directory
'mariadb-tools/dbt3_benchmark/tests'. Each configuration file has an 'ini'
configuration syntax and is parsed by the perl automation script with the CPAN
module [Config::Auto](https://search.cpan.org/~simon/Config-Auto-0.03/Auto.pm)

###### Configuration keywords

Every configuration file could contain keywords that will be replaced by the
script with particular values. They are used for convenience when you want to
make your configuration files more common to the environment that you have
prepared for the benchmark. These keywords are:

* `$PROJECT_HOME` – used as the directory where the
 project ``mariadb-tools`' is located or as a base path for the whole project
 (e.g. "`DBMS_HOME = $PROJECT_HOME/bin/mariadb-5.3.x-beta-linux-x86_64`").
 It is replaced by the value set with the startup parameter 'project-home'
 passed to launcher.pl,

* `$DATADIR_HOME` – used as the directory where the
 datadir folders are located for the benchmark (e.g.
 "`$DATADIR_HOME/myisam-s30`"). It is replaced by the value set
 with the startup parameter 'datadir-home' passed to launcher.pl.

* `$QUERIES_HOME` – used as the directory where the
 queries are located (e.g. "`$QUERIES_HOME/s30-m`"
 – queries for MariaDB/MySQL for scale factor 30). It
 is replaced by the value set with the startup parameter 'queries-home'
 passed to launcher.pl.

* `$SCALE_FACTOR` – the scale factor that will be
 used. It is usually a part of the name of the datadir directory (e.g.
 "`$DATADIR_HOME/myisam-s$SCALE_FACTOR`"), the queries directory (e.g.
 "`$QUERIES_HOME/s$SCALE_FACTOR-m`") or the database configuration directory
 (e.g. `$PROJECT_HOME/mariadb-tools/dbt3_benchmark/config/s$SCALE_FACTOR`).
 It is replaced by the value set with the startup parameter 'scale-factor'
 passed to launcher.pl.

Note that if any of the configuration files contains such keyword, the
corresponding startup parameter passed to **launcher.pl** will become required.

###### Top-level configuration

A top-level configuration file provides paths to the **Test, DBMS, Queries**
and **Results database** configurations files
```

```
There are default configuration files in the directory
`mariadb-tools/dbt3_benchmark/tests/` and contain the following settings:

| Parameter | Description |
| --- | --- |
| RESULTS_DB_CONFIG | The configuration file for results DB settings |
| TEST_CONFIG | The configuration file for the test settings |
| QUERIES_CONFIG | The configuration file for the queries settings |
| DB_CONFIG | The configuration file for the DBMS server settings |

This file has the following format:
```

[common]
RESULTS_DB_CONFIG = $PROJECT_HOME/mariadb-tools/dbt3_benchmark/tests/results_db_conf/results_db.conf
TEST_CONFIG = $PROJECT_HOME/mariadb-tools/dbt3_benchmark/tests/test_conf/test_myisam.conf

[mariadb_5_3]
QUERIES_CONFIG = $PROJECT_HOME/mariadb-tools/dbt3_benchmark/tests/queries_conf/queries.conf
DB_CONFIG = $PROJECT_HOME/mariadb-tools/dbt3_benchmark/tests/db_conf/db_mariadb_5_3_myisam.conf

[mysql_5_5]
QUERIES_CONFIG = $PROJECT_HOME/mariadb-tools/dbt3_benchmark/tests/queries_conf/queries_mysql.conf
DB_CONFIG = $PROJECT_HOME/mariadb-tools/dbt3_benchmark/tests/db_conf/db_mysql_5_5_myisam.conf
…

NOTE: The settings `RESULTS_DB_CONFIG` and `TEST_CONFIG` should be set
under the `[common]` section. They are common for the whole test (although
some settings from `TEST_CONFIG` could be overridden in the
`QUERIES_CONFIG` file). All settings that combine `QUERIES_CONFIG` and
`DB_CONFIG` should be in a separate section (e.g. `[mariadb_5_3]`).

A test configuration is passed as an input parameter to the automation script
with the parameter
`--test=/path/to/some_test_configuration.conf` (see
#script-startup-parameters)

DBMS server configuration

These configuration files contain settings that describe the benchmarked DBMS.
They are usually contained into the folder
`mariadb-tools/dbt3_benchmark/tests/db_conf`.

Here is the list of parameters that could be set into this configuration file:

Parameter	Description
DBMS_HOME	Where the installation folder of MariaDB / MySQL / PostgreSQL is located.NOTE: The automation script uses "./bin/mysqld_safe" to start the mysqld process. So the versions of MariaDB and MySQL should be a "binary distribution" ones.
DBMS_USER	The database user that will be used.
CONFIG_FILE	The config file that mysqld or postgres will use when starting
SOCKET	The socket that will be used to start the server
PORT	The port that the server will be started on
HOST	The host where the server is located
DATADIR	Where the datadir for mysqld or postgres is located
TMPDIR	Where the temp tables will be created while sorting and grouping.
DBNAME	The database (schema) name where the benchmark tables are located.
KEYWORD	This text will be stored into the results database as a keyword. Also will be used as a name for a subfolder with results and statistics.
DBMS	Database Management System that will be used. Possible values: "MySQL", "MariaDB" and "PostgreSQL"
STORAGE_ENGINE	The storage engine that was used (MyISAM, InnoDB, etc.)
STARTUP_PARAMS	Any startup parameters that will be used while starting the mysqld process or postgres process. Same format as given on the command line.
GRAPH_HEADING	The heading of the graphic for that particular test.
MYSQL_SYSTEM_DIR	See "MYSQL_SYSTEM_DIR note", below.
READ_ONLY	If set to 1, mysqld process will be started with '--read-only' startup parameter
PRE_RUN_SQL	SQL commands that are run prior each query run
POST_RUN_SQL	SQL commands that are run after each query run
PRE_TEST_SQL	SQL commands that are run prior the whole test with that database settings
POST_TEST_SQL	SQL commands that are run after the whole test with that database settings

`MYSQL_SYSTEM_DIR` note:
This option is added for convenience when you want to save time and disk space
for generating databases for different DBMS (and different versions) and use a
single data directory for all of them. When running different versions of
MariaDB/MySQL over a single datadir, one should run
[mysql-upgrade](https://dev.mysql.com/doc/refman/5.5/en/mysql-upgrade.html) in
order to fix the system tables. So in one data directory, you could prepare the
following directories for different MariaDB/MySQL system directories:

* `mysql_mysql_5_5` — a copy of the system directory
 ''mysql`' upgraded by MySQL 5.5.x
* `mysql_mariadb_5_3` — a copy of the system
 directory ''mysql`' upgraded by [MariaDB 5.3](https://mariadb.com/docs/release-notes/community-server/old-releases/5.3/changes-improvements-in-mariadb-5-3).x
* `mysql_mariadb_5_5` — a copy of the system
 directory ''mysql`' upgraded by [MariaDB 5.5](https://mariadb.com/docs/release-notes/community-server/old-releases/5.5/changes-improvements-in-mariadb-5-5).x

If `MYSQL_SYSTEM_DIR` is set to one of these directories, the automation
script will unlink the current system directory 'mysql' and make a new symbolic

> link with that name to the one in the setting.
> Here is an example command that will be executed:

unlink /path/to/datadir/mysql
ln -s /path/to/value/in/MYSQL_SYSTEM_DIR/mysql_mariadb_5_3 /path/to/datadir/mysql

> **NOTE:** This approach is suitable for MyISAM tests.
>
> The configuration file looks like this:

[db_settings]
DBMS_HOME = $PROJECT_HOME/bin/mariadb-5.3.2-beta-linux-x86_64
DBMS_USER = root
…

```
Note that the section `[db_settings]` is required for the file to be properly
parsed by the automation script.

###### Test configuration

These configuration files contain settings describing the test. They are
usually contained into the folder
**mariadb-tools/dbt3_benchmark/tests/test_conf**.

Here is the list of parameters that could be set into this configuration file:

| Parameter | Description |
| --- | --- |
| QUERIES_AT_ONCE | If set to 1, then all the queries are executed sequentially without restarting the
server or clearing the caches between queries. |
| CLEAR_CACHES | If set to 1, the disk caches will be cleared before each query test. |
| WARMUP | Perform a warm-up runs before running the query. |
| EXPLAIN | Run an Explain command prior the run of the query. The explain results will be stored in a
file under the results output directory. |
| RUN | Perform the actual test |
| ANALYZE_EXPLAIN | A result extraction mechanism where only the best execution plan (results from
EXPLAIN select) will be measured. It is designed to be used when benchmarking InnoDB storage engine where
execution plan is changing between server restarts (see [#results-extraction-mechanisms](#results-
extraction-mechanisms)). |
| MIN_MAX_OUT_OF_N | A result extraction mechanism where the minimal and maximal values out of N (set by
the parameter NUM_TESTS) tests are taken as a result. This could be used when InnoDB storage engine is
tested (see [#results-extraction-mechanisms](#results-extraction-mechanisms)). |
| SIMPLE_AVERAGE | A result extraction mechanism where the final result is the average time taken for the
tests. The number of tests is per query is set by the NUM_TESTS parameter. Note that if even one test has
timed out, the result is 'time-out'. This is used when testing MyISAM storage engine since there the
execution plan is constant (see [#results-extraction-mechanisms](#results-extraction-mechanisms)). |
| NUM_TESTS | How many tests should be performed for each query. When ANALYZE_EXPLAIN is set, this value
could be set to 0, meaning that the tests will continue until enough results are extracted (see setting
CLUSTER_SIZE). This parameter is very important when MIN_MAX_OUT_OF_N or SIMPLE_AVERAGE is selected. |
| MAX_SKIPPED_TESTS | When ANALYZE_EXPLAIN is set and an execution plan that is slower is selected, the
execution of the query is skipped and the server is restarted in order to change the execution plan. If
the server is restarted more than MAX_SKIPPED_TESTS, there are obviously no more different execution
plans and the script continues to the next query benchmark. |
| WARMUPS_COUNT | How many warmup runs will be performed prior the actual benchmark run. |
| CLUSTER_SIZE | How big a cluster with results for a query should be in order to extract the final
result. It is used when ANALYZE_EXPLAIN is selected as a result extraction method. |
| MAX_QUERY_TIME | The maximum time that one query will be tested. Currently it is applicable only when
ANALYZE_EXPLAIN is selected. |
| TIMEOUT | The maximum time that one query could run. Currently timeout is applicable only for MySQL and
MariaDB. |
| OS_STATS_INTERVAL | What is the time interval between extraction of OS statistics for CPU, memory, etc.
|
| PRE_RUN_OS | OS commands that should be executed prior each query run |
| POST_RUN_OS | OS commands that should be executed after each query run |
| PRE_TEST_OS | OS commands that should be executed prior the whole test |
| POST_TEST_OS | OS commands that should be executed after the whole test is complete |

The configuration file looks like this:
```

QUERIES_AT_ONCE = 0
CLEAR_CACHES = 1
WARMUP = 0
…

```
###### Queries configuration

These configuration files contain the list of all the queries that will be
benchmarked against each database. Some settings
from `DBMS server configuration` and `Test configuration` could be
overridden into the `Queries configuration` files. The folder that contains
such configurations is `mariadb-tools/dbt3_benchmark/tests/queries_conf`.

Here is the list of parameters that could be set into this configuration file:

| Parameter | Description |
| --- | --- |
| QUERIES_HOME | Where the queries are located on disk. This value is concatenated to the QUERY setting
and this makes the path to the particular query. NOTE: This setting should be set under the section
[queries_settings]. |
| CONFIG_FILE | This overrides the startup setting CONFIG_FILE from DMBS server configuration file and
sets the database configuration file that is used. It could be used if some configuration file without
any optimizations should be set for this particular queries configuration file.NOTE: This setting should
be set under the section [queries_settings]. |
| QUERY | The name of the query located into QUERIES_HOME folder. E.g. "1.sql" |
| EXPLAIN_QUERY | The name of the explain query into QUERIES_HOME folder. E.g. "1_explain.sql" |
| TMPDIR | This overrides the setting TMPDIR from the DMBS server configuration. |
| STARTUP_PARAMS | This overrides the setting STARTUP_PARAMS from the DMBS server configuration. Using
this setting one could change the particular startup parameters (like optimizations and buffers) for the
DB server. |
| PRE_RUN_SQL | This overrides the setting PRE_RUN_SQL from the DMBS server configuration. |
| POST_RUN_SQL | This overrides the setting POST_RUN_SQL from the DMBS server configuration. |
| RUN | This overrides the setting RUN from the test configuration. |
| EXPLAIN | This overrides the setting EXPLAIN from the test configuration. |
| TIMEOUT | This overrides the setting TIMEOUT from the test configuration. |
| NUM_TESTS | This overrides the setting NUM_TESTS from the test configuration. |
| MAX_SKIPPED_TESTS | This overrides the setting MAX_SKIPPED_TESTS from the test configuration. |
| WARMUP | This overrides the setting WARMUP from the test configuration. |
| WARMUPS_COUNT | This overrides the setting WARMUPS_COUNT from the test configuration. |
| MAX_QUERY_TIME | This overrides the setting MAX_QUERY_TIME from the test configuration. |
| CLUSTER_SIZE | This overrides the setting CLUSTER_SIZE from the test configuration. |
| PRE_RUN_OS | This overrides the setting PRE_RUN_OS from the test configuration. |
| POST_RUN_OS | This overrides the setting POST_RUN_OS from the test configuration. |
| OS_STATS_INTERVAL | This overrides the setting OS_STATS_INTERVAL from the test configuration. |

The queries configuration file could look like this:
```

[queries_settings]
QUERIES_HOME = /path/to/queries

[query1]
QUERY=1.sql
EXPLAIN_QUERY=1_explain.sql
STARTUP_PARAMS=

[query2]
QUERY=2.sql
EXPLAIN_QUERY=2_explain.sql
STARTUP_PARAMS=–optimizer_switch=‘mrr=on’ –mrr_buffer_size=8M –some_startup_parmas
…

```
...where "`QUERIES_HOME = /path/to/queries`" could be replaced with
"`QUERIES_HOME = $QUERIES_HOME/s$SCALE_FACTOR-m`" for example and thus
`$QUERIES_HOME` and $SCALE_FACTOR will be replaced by the script startup
parameters passed to `launcher.pl` (see [#script-startup-parameters](#script-startup-parameters))

**NOTE:** The section `[queries_settings]` is required for the configuration
file to be parsed correctly. Also each query settings should be set under an
uniquely named configuration section (e.g. `[query1]` or `[1.sql]`)

###### Results database configuration

These configuration files contain settings about the database where the results
will be stored. They are usually contained into the folder
`mariadb-tools/dbt3_benchmark/tests/results_db_conf`.

Here is the list of parameters that could be set into this configuration file:

| Parameter | Description |
| --- | --- |
| DBMS_HOME | Where the database directory is located. E.g. "$PROJECT_HOME/mariadb-5.3.x-beta-linux-
x86_64". This should be a binary distribution of MariaDB or MySQL. |
| DBMS_USER | The user that will be used by the DBMS |
| DATADIR | Where the data directory is located for the results database |
| CONFIG_FILE | What the configuration file used by the database is. |
| SOCKET | The socket that will be used by the results database. This should be different socket than the
one provided for the testing databases. |
| PORT | The port that the results database will use. This should be different port than the one provided
for the testing databases. |
| STARTUP_PARAMS | Any startup parameters that should be set to start the server. |
| DBNAME | The database name to use. |
| HOST | The host where the results database is. |

The results database configuration could look like this:
```

DBMS_HOME = $PROJECT_HOME/mariadb-5.3.x-beta-linux-x86_64
DBMS_USER = root
...

```
###### Script startup parameters

`launcher.pl` could accept startup parameters called in the manner
"`--some-param`". Note that these startup parameters are
case-sensitive. The ones that are with upper-case are used when overriding a
setting in some of the configuration files.

Here is a list of the startup parameters:

| Parameter | Description |
| --- | --- |
| test | The top-level benchmark configuration file that will be run. This is a required startup
parameter. |
| results-output-dir | Where the results of the benchmark will be stored. A timestamp is automatically
attached to the directory name so that it keeps track of time and date of the benchmark. This is a
required parameter. |
| dry-run | If set, no benchmark will be performed. Instead only messages will be displayed for the
actions that were intended to be done. |
| project-home | Required if any configuration file uses the variable '$PROJECT_HOME'. If all
configuration files use absolute paths, not used. |
| datadir-home | The value in this parameter will replace any occurrences of the string '$DATADIR_HOME'
into the configuration files. If there are no such occurrences, it is not a required parameter. |
| queries-home | The value in this parameter will replace any occurrences of the string '$QUERIES_HOME'
into the configuration files. If there are no such occurrences, it is not a required parameter. |
| scale-factor | The value in this parameter will replace any occurrences of the string '$SCALE_FACTOR'
into the configuration files. If there are no such occurrences, it is not a required parameter. |
| CLEAR_CACHES | If set. this overrides the default setting set into the test configuration file. |
| QUERIES_AT_ONCE | If set. this overrides the default setting set into the test configuration file. |
| RUN | If set. this overrides the default setting set into the test configuration file. |
| EXPLAIN | If set. this overrides the default setting set into the test configuration file. |
| TIMEOUT | If set. this overrides the default setting set into the test configuration file. |
| NUM_TESTS | If set. this overrides the default setting set into the test configuration file. |
| MAX_SKIPPED_TESTS | If set. this overrides the default setting set into the test configuration file. |
| WARMUP | If set. this overrides the default setting set into the test configuration file. |
| WARMUPS_COUNT | If set. this overrides the default setting set into the test configuration file. |
| MAX_QUERY_TIME | If set. this overrides the default setting set into the test configuration file. |
| CLUSTER_SIZE | If set. this overrides the default setting set into the test configuration file. |
| PRE_RUN_OS | If set. this overrides the default setting set into the test configuration file. |
| POST_RUN_OS | If set. this overrides the default setting set into the test configuration file. |
| OS_STATS_INTERVAL | If set. this overrides the default setting set into the test configuration file. |

###### Results extraction mechanisms

There are three possible result extraction mechanisms. They are set by the
parameters set into the test configuration file:

* `ANALYZE_EXPLAIN`
* `MIN_MAX_OUT_OF_N`
* `SIMPLE_AVERAGE`

Only one of these should be set to true (1).

**`ANALYZE_EXPLAIN`** is used for benchmarking InnoDB storage engine where the
execution plan could change for the same query when the server is restarted. It
is designed to run the query only with the fastest execution plan. This means
that the server is restarted if the current execution plan is proven slower
than the other. As a final result is taken the result for the query plan that
turns out to be fastest and there are at least `CLUSTER_SIZE` tests with it for
that query. By setting the configuration parameter `NUM_TESTS` you can set a
maximum test runs that when reached will get the best cluster's average time
(even if it is less than `CLUSTER_SIZE`). Also when a timeout for that query
(`MAX_QUERY_TIME`) is reached, the scoring mechanism will return the best
available cluster result.

**`MIN_MAX_OUT_OF_N`** is also used for benchmarking InnoDB storage engine.
As a result are stored the values for the fastest and the slowest run. It is
assumed that when the execution plan has changed it has different execution
```

```
plan and we are interested only in the min and max time.

**`SIMPLE_AVERAGE`** is used for benchmarking storage engines that do not
change the execution plan between restarts like MyISAM. The final result is the
average execution time from all the test runs for the query.

###### Results graphics

After each query test run, the result is stored into a file named
**results.dat** located into `{RESULTS_OUTPUT_DIR}`. This file
is designed to be easy to be read by the plotting program Gnuplot 4.4. It is
divided into blocks, separated by several new lines. Each block starts with a
comment line containing details for the current block of results.

Queries that have timed out have a value of `100000` so that they run out of
the graphics and are cut off. Other queries have their real times (in seconds)
starting from `0`. The graphics is cut off on the y-axis on the longest time
for `completed test + 20%`. For example if the longest time is `100`
seconds, the graphics is cut-off to `120` seconds. Thus the timed out queries
will be truncated by this limitation and will seem as really timed out.

During the test run, a gnuplot script file is generated with the necessary
parameters for the graphics to be generated automatically. After each query
test run is complete, the graphic is regenerated, so that the user can see the
current results before the whole benchmark is complete. This file is called
`gnuplot_script.txt` and is located into `{RESULTS_OUTPUT_DIR}`. The user
can edit it to fine-tune the parameters or headings after the test is complete
so that one could get the look and feel he/she wants for the final result.

###### Script output

###### Benchmark output

In the directory set by the parameter {RESULTS_OUTPUT_DIR} (example:
`/benchmark/dbt3/results/myisam_test_2011-12-08_191427/`) there are the
following files/directories:

* A directory for each test, named as the parameter {KEYWORD} from the test
 configuration (example: `mariadb-5-3-2`)
* cpu_info.txt — the output
 of "`/bin/cat /proc/cpuinfo`" OS command
* uname.txt — the output of "`uname -a`" OS
 command
* results.dat — the results of each query
 execution in one file. This file will be used as a datafile for the gnuplot
 script. It also contains the ratio between the current test and the first
 one.
* gnuplot_script.txt — the Gnuplot script that
 renders the graphics.
* graphics.jpeg — the output graphics
* A benchmark configuration file
 (example: `myisam_test_mariadb_5_3_mysql_5_5_mysql_5_6.conf`) copied
 from `mariadb-tools/dbt3_benchmark/tests/`
* A results database configuration file (example: `results_db.conf`)
 copied from `mariadb-tools/dbt3_benchmark/tests/results_db_conf/`
* A test configuration file (example: `test_myisam.conf`) copied
 from `mariadb-tools/dbt3_benchmark/tests/test_conf/`

###### Test output

In the subdirectory for the particular test, set by the parameter {KEYWORD}
(example:
`/benchmark/dbt3/results/myisam_test_2011-12-08_191427/mariadb-5-3-2/`),
there are the following files:

* pre_test_os_resutls.txt - the output of the OS commands (if any) executed
 before the first query run for that test
* pre_test_sql_resutls.txt - the output of the SQL commands (if any)
 executed before the first query run for that test
```

```
* post_test_os_resutls.txt - the output of the OS commands (if any)
 executed after the last query run for that test
* post_test_sql_resutls.txt - the output of the SQL commands (if any)
 executed after the last query run for that test
* all_explains.txt - a file containing all the explain queries, their
 startup parameters for the benchmark and the explain result
* The config file (my.cnf) that was passed to mysqld or postgres
 (example: `mariadb_myisam_my.cnf`) copied
 from `mariadb-tools/dbt3_benchmark/config/s$SCALE_FACTOR/`
* The queries configuration file (example: ''queries-mariadb.conf'') copied
 from `mariadb-tools/dbt3_benchmark/tests/queries_conf/`
* The database configuration file (example: ''db_mariadb_5_3_myisam.conf'')
 copied from `mariadb-tools/dbt3_benchmark/tests/db_conf/`

###### Query output

For each query execution there are several files that are outputted by the
automation script. They are all saved under the subdirectory set by the
parameters `{KEYWORD}`:

* Explain result - a file named
 '{query_name}_{number_of_query_run}_results.txt' (example:
 '1_explain.sql_1_results.txt' — first test for 1_explain.sql)
* Pre-run OS commands - OS commands, executed before the actual query run.
 Output is a file named
 'pre_run_os_q_{query_name}_no_{number_of_query_run}_results.txt' (example:
 'pre_run_os_q_1.sql_no_2_results.txt' — second test for query 1.sql)
* Pre-run SQL commands - SQL commands executed before the actual query run.
 Output is a file named
 'pre_run_sql_q_{query_name}_no_{number_of_query_run}_results.txt'.
* Post-run OS commands - OS commands, executed after the actual query run.
 Output is a file named
 'post_run_os_q_{query_name}_no_{number_of_query_run}_results.txt'.
* Post-run SQL commands - SQL commands executed after the actual query run.
 Output is a file named
 'post_run_sql_q_{query_name}_no_{number_of_query_run}_results.txt'.
* CPU utilization statistics:
 '{query_name}_no_{number_of_query_run}_sar_u.txt'
* I/O and transfer rate statistics:
 '{query_name}_no_{number_of_query_run}_sar_b.txt'
* Memory utilization statistics:
 '{query_name}_no_{number_of_query_run}_sar_r.txt'

###### Hooks

The automation script provides hooks that allow the user to add both SQL and OS commands prior and after
each test. Here is a list of all possible hooks:

* Pre-test SQL hook: it is set with the parameter `PRE_TEST_SQL`. Contains
 SQL commands that are run once for the whole test configuration before the
 first run.
 (Example: "`use dbt3; select version(); show variables; show engines; show table status;`")
* Post-test SQL hook: it is set with the parameter `POST_TEST_SQL`. Contains
 SQL commands that are run once for the whole test configuration after the
 last run.
* Pre-test OS hook: it is set with the parameter `PRE_TEST_OS`. Contains OS
 commands that are run once for the whole test configuration before the first
 run.
* Post-test OS hook: it is set with the parameter `POST_TEST_OS`. Contains OS
 commands that are run once for the whole test configuration after the last
 run.
* Pre-run SQL hook: it is set with the parameter `PRE_RUN_SQL`. Contains SQL
 commands that are run prior each query run.
 (Example: "`flush status; set global userstat=on;`")
* Post-run SQL hook: it is set with the parameter `POST_RUN_SQL`. Contains SQL
 commands that are run after each query run.
 (Example: "`show status; select * from information_schema.TABLE_STATISTICS;`")
* Pre-run OS hook: it is set with the parameter `PRE_RUN_OS`. Contains OS
 commands that are run once prior each query run.
```

```
* Post-run OS hook: it is set with the parameter `POST_RUN_OS`. Contains OS
 commands that are run once after each query run.

The results of these commands is stored into the
`{RESULTS_OUTPUT_DIR}/{KEYWORD}` folder (see [#script-output](#script-output))

###### Activities

Here are the main activities that this script does:

1. Parse the configuration files and check the input parameters - if any of the
 required parameters is missing, the script will stop resulting an error.
1. Collect hardware information - collecting information about the hardware of
 the machine that the benchmark is run. Currently it collects `cpuinfo`
 and `uname`. Results of these commands are stored into the results output
 directory set as an input parameter
1. Loop through the passed test configurationsFor each passed in test
 configuration the script does the following:

  1. Start the results database server. The results of the test are stored into
 that database.
  1. Clears the caches on the serverClearing the caches is done with the
 following
 command:
```

sudo /sbin/sysctl vm.drop_caches=3

```
    * NOTE: In order to clear the caches, the user is required to have
 sudo rights and the following line should be added to the `sudoers` file
 (edit it with "`sudo vusudo`"
 command):
```

{your_username} ALL=NOPASSWD:/sbin/sysctl

```
 1. Start the database server
 1. Perform pre-test SQL commands. The results are stored
under `results_output_dir/{KEYWORD}` folder and are
called `pre_test_sql_results.txt`. `{KEYWORD}` is a unique keyword for
the current database configuration.
 1. Perform pre-test OS commands. The results are stored
under `results_output_dir/{KEYWORD}` folder and are
called `pre_test_os_results.txt`.

   * NOTE: If in the test configuration the setting QUERIES_AT_ONCE is
set to 0, then the server is restarted between each query run. Thus the
steps 3.2, 3.3, 3.4 and 3.5 are executed only once right before step 3.6.2.
 1. Read all query configurations and execute the following for each of them:

   1. Check the test configuration parameters. If something is wrong with some
required parameter, the program will exit resulting an error.
   1. Get the server version if that's the first run of the query
   1. Perform pre-run OS commands in shell. The results of these queries are
stored into a file named `pre_run_os_q_{QUERY}_no_{RUN_NO}_results.txt`
under `results_output_dir/{KEYWORD}` where `{QUERY}` is the query name
(ex: `1.sql`), `{RUN_NO}` is the sequential run number
and `{KEYWORD}` is a unique keyword for the particular test
configuration.
   1. Perform pre-run SQL queries. The results of these queries are stored into a
file named `pre_run_sql_q_{QUERY}_no_{RUN_NO}_results.txt`
under `results_output_dir/{KEYWORD}` where `{QUERY}` is the query name
(ex: `1.sql`), `{RUN_NO}` is the sequential run number and `{KEYWORD}` is
a unique keyword for the particular test configuration.
   1. Perform warm-up runs if set into the test configuration file
   1. Perform actual test run and measure time.

     * During this step, a new child process is created in order to measure
the statistics of the OS. Currently the statistics being collected are:

       * CPU utilization statistics. The command for this is:
```

sar -u 0 2>null

```
       * I/O and transfer rate statistics. The command for this is:
```

sar -b 0 2>null

```
       * Memory utilization statistics. The command for this is:
```

sar -r 0 2>null

```
     * These statistics are measured every N seconds, where `N` is set with
 the `OS_STATS_INTERVAL` test configuration parameter.
     * The test run for MariaDB and MySQL has an implemented mechanism for
 cut-off when timeout exceeds. It is controlled with the `TIMEOUT` test
 parameter. Currently for PostgreSQL there is no such functionality and
 should be implemented in future versions.
    1. Execute the "explain" statement for that query.

     * NOTE: Running `EXPLAIN` queries with MySQL prior version 5.6.3 could
 result in long running queries since MySQL has to execute the whole query
 when there are nested selects in it. For MariaDB and PostgreSQL there is
 no such problem. The long-running explain queries are for queries #7, 8,
 9, 13 and 15. For that reason in MySQL prior version 5.6.3 for these
 queries no `EXPLAIN` selects should be executed.
    1. Perform post-run SQL queries
    1. Perform post-run OS commands in shell
    1. Log the results into the results database
    1. A graphics with the current results is generated using Gnuplot
  1. Shutdown the database server.
  1. Perform post-test SQL commands. The results are stored
 under `results_output_dir/{KEYWORD}` folder and are
 called `post_test_sql_results.txt`.
  1. Perform post-test OS commands. The results are stored
 under `results_output_dir/{KEYWORD}` folder and are
 called `post_test_os_results.txt`.
  1. Stop the results database server

###### Script calling examples

* Example call for MyISAM test for scale factor 30 and timeout 10 minutes:
```

perl launcher.pl
--project-home=/path/to/project/home/
--results-output-dir=/path/to/project/home/results/myisam_test
--datadir=/path/to/project/home/db_data/
--test=/path/to/project/home/mariadb-tools/dbt3_benchmark/tests/myisam_test_mariadb_5_3_mysql_5_5_mysql_5_6.conf
--queries-home=/path/to/project/home/gen_query/
--scale-factor=30
--TIMEOUT=600

```
...where `/path/to/project/home` is where the `mariadb-tools` project is
located. This will replace all occurrences of the string "$PROJECT_HOME" in the
configuration files (example: "`TMPDIR = $PROJECT_HOME/temp/`" will become
"`TMPDIR = /path/to/project/home/temp/`").

`--TIMEOUT` overrides the timeout setting into the test
configuration file to 10 minutes.

* Example for InnoDB test for scale factor 30 with 2 hours timeout per query
 and 3 runs for each query:
```

perl launcher.pl
--project-home=/path/to/project/home/
--results-output-dir=/path/to/project/home/results/innodb_test
--datadir=/path/to/project/home/db_data/
--test=/path/to/project/home/mariadb-tools/dbt3_benchmark/tests/innodb_test_mariadb_5_3_mysql_5_5_mysql_5_6.conf
--queries-home=/path/to/project/home/gen_query/
--scale-factor=30

--TIMEOUT=7200
--NUM_TESTS=3

```
* If a newer version of [MariaDB 5.5](https://mariadb.com/docs/release-notes/community-server/old-
releases/5.5/changes-improvements-in-mariadb-5-5) is available:

  * copy or edit the DMBS server configuration
 file `mariadb-tools/dbt3_benchmark/tests/db_conf/db_mariadb_5_5_myisam.conf`
 and change the parameter `DBMS_HOME` to the new binary distribution. You
 can also edit `KEYWORD` and `GRAPH_HEADING`

* If you want to add additional test in the MyISAM benchmark for [MariaDB 5.3]
(https://mariadb.com/docs/release-notes/community-server/old-releases/5.3/changes-improvements-in-
mariadb-5-3),
 but with another defaults-file (my.cnf):

  * copy or edit the DMBS server configuration
 file `mariadb-tools/dbt3_benchmark/tests/db_conf/db_mariadb_5_3_myisam.conf`
 and change the parameter CONFIG_FILE to the new my.cnf
  * copy or edit the test configuration
 file `mariadb-tools/dbt3_benchmark/tests/myisam_test_mariadb_5_3_mysql_5_5_mysql_5_6.conf`
 and add the new configuration settings:
```

[mariadb_5_3_new_configuration]
QUERIES_CONFIG = $PROJECT_HOME/mariadb-tools/dbt3_benchmark/tests/queries_conf/queries-mariadb.conf
DB_CONFIG = $PROJECT_HOME/mariadb-tools/dbt3_benchmark/tests/db_conf/db_mariadb_5_3_myisam_new_configuration.conf

```
* If you want to add additional startup parameters for query 6 for MariaDB for
 example:

  * copy or edit the
 file `mariadb-tools/dbt3_benchmark/tests/queries_conf/queries-mariadb.conf`
 and add a parameter
 "`STARTUP_PARAMS=--optimizer_switch='mrr=on' --mrr_buffer_size=96M`"
 for example for the section for query 6.
  * copy or edit the test configuration
 file `mariadb-tools/dbt3_benchmark/tests/myisam_test_mariadb_5_3_mysql_5_5_mysql_5_6.conf`
 to include the new queries configuration file

###### Results

###### MyISAM test

DBT3 benchmark for the following configuration:

* [MariaDB 5.3.2](https://mariadb.com/docs/release-notes/community-server/old-releases/5.3/5.3.2) Beta +
MyISAM
* [MariaDB 5.5.18](https://mariadb.com/kb/en/mariadb-5518-release-notes/) + MyISAM
* MySQL 5.5.19 + MyISAM
* MySQL 5.6.4 + MyISAM

Results page: [DBT3 benchmark results MyISAM](#pg-long-running-tests-benchmarks-dbt3-benchmark-results-
myisam-5ade69bd)

###### InnoDB test

DBT3 benchmark for the following configuration:

* [MariaDB 5.3.2](https://mariadb.com/docs/release-notes/community-server/old-releases/5.3/5.3.2) Beta +
XtraDB
* MariaDB 5.5.18 + XtraDB
* MySQL 5.5.19 + InnoDB
* MySQL 5.6.4 + InnoDB

Results page: [DBT3 benchmark results InnoDB](#pg-long-running-tests-benchmarks-dbt3-benchmark-results-
innodb-42ee177d)

###### PostgreSQL test

DBT3 benchmark for the following configuration:

* [MariaDB 5.3.2](https://mariadb.com/docs/release-notes/community-server/old-releases/5.3/5.3.2) Beta +
XtraDB
* MySQL 5.6.4 + InnoDB
* PostgreSQL

DBT3 Benchmark Results InnoDB

Introduction

This page shows the results for benchmarking the following configuration:

- MariaDB 5.3.1 Beta + XtraDB with all optimizations (optimizater_switch) set to `ON`
- MariaDB 5.3.1 Beta + XtraDB with Igor's suggested optimizations
- MySQL 5.5.13 + InnoDB
- MySQL 5.6.2 + InnoDB

The test is performed using the automation script under `/mariadb-tools/dbt3_benchmark`.

Details about this automation script could be found in DBT3 automation scripts

Hardware

The tests were performed on pitbull.askmonty.org. It has the following parameters:

- CPU: Two socket X hexacore Intel Xeon X5660 = 12 CPUs with hyperthreading on: 24 virtual CPUs
- Memory: 23GB
- Logical disk: HDD 500.1 GB as software RAID1
  - device size with M = 1000*1000: 500107 MBytes (500 GB)
  - cache/buffer size = 16384 KBytes
  - Nominal Media Rotation Rate: 7200
- Operating System: Ubuntu 10.10 (x86_64)

Scale factor 10

This test is performed with the following parameters:

- Scale factor: 10
- Query timeout: 600 sec.
- Cluster size: 3
- Total DB size on disk: about 24GB

Steps to reproduce

Follow the instructions in DBT3 automation scripts to prepare the environment for the test.

Before you run the test, reassure that the settings into the test configuration files match your prepared environment. For more details on the test configuration, please, refer to the test configuration parameters.

For that test you should set the SCALE_FACTOR parameter to 10 for the following files before the test:

- mariadb_innodb_igor_s1.pm
- mariadb_innodb_s1.pm
- mysql_5_5_15_innodb_s1.pm
- mysql_5_6_2_innodb_s1.pm

NOTE: In future versions the scale factor will be passed in as an input parameter to `launcher.pl` instead of being test configuration parameter.

After the environment is prepared, the following command should be executed in the shell:

```
perl launcher.pl --test={PROJECT_HOME}/mariadb-tools/dbt3_benchmark/tests/mariadb_myisam_s1.pm \
 --test={PROJECT_HOME}/mariadb-tools/dbt3_benchmark/tests/mysql_5_5_15_myisam_s1.pm \
 --test={PROJECT_HOME}/mariadb-tools/dbt3_benchmark/tests/mysql_5_6_2_myisam_s1.pm
 --results-output-dir=path/to/results/output/dir
```

Results

Here is the graphics of the results:

NOTE: Queries that are cut off by the graphics have timed out the period of
600 seconds for that test.

Here are the actual results:

Configuration	1.sql	2.sql	3.sql	4.sql	5.sql	6.sql	7.sql	8.sql	9.sql	10.sql	11.sql	12.sql	13.sql	14.sql	15.sql	16.sql	17.sql	18.sql	19.sql	20.sql	21.sql	22.sql
MariaDB 5.3.1 + XtraDB with all optimizations to ON	165	n/a	4243.333	n/a	n/a	114.333	n/a	n/a	n/a	n/a	536	173	n/a	n/a	n/a	52	452	n/a	n/a	n/a	n/a	8
MariaDB 5.3.1 + XtraDB with Igor's suggestions for optimization	163.667	n/a	n/a	n/a	n/a	114	n/a	n/a	n/a	n/a	538	280.667	n/a	257	n/a	60	456	n/a	n/a	n/a	n/a	8
MySQL 5.5.15 + InnoDB	104	n/a	n/a	n/a	n/a	103	n/a	n/a	n/a	n/a	534.667	177	n/a	n/a	n/a	n/a	476	n/a	n/a	n/a	n/a	6
MySQL 5.6.2 + InnoDB	103	n/a	n/a	n/a	n/a	104	n/a	n/a	n/a	n/a	531	168	n/a	n/a	n/a	55	460.667	n/a	n/a	n/a	n/a	6

The archived folder with all the results and details for that benchmark can be downloaded from:Image:Res_myisam_timeout_120_s10_2011-09-15_190613.zip

Comments

From the graphics we can see that for the first query MySQL has performed better than MariaDB with about 37%.

For the third query on the other hand MariaDB with all optimizations set to ON is the only one query that returned results before the timeout exceeded. This means that it has at least 30% better performance. Also there is some option that could optimize Igor's set of settings even more for that query. For the particular numbers, the same test should be performed with longer timeouts.

For query #6 it turns out that both MySQL 5.5.15 and 5.6.2 are faster than MariaDB with about 10%.

For query #12 Igor's settings could be readjusted, so that the query execution time could fall with 38%.

Igor's settings turned out to be the only one that could finish query #14 before the timeout exceeded.

From query #16 we can see that MySQL have made a great performance improvement from version 5.5.15 to 5.6.2 to make the query finish at least ten times faster.

For all the other queries the results are either statistically the same, or the queries have timed out for all configurations and the test should be repeated with longer timeout limit.

Summary

Most of the queries have timed out for the given period of 10 minutes per query and until a new test with longer timeout is performed, no correct comparison summary could be made.

This page is licensed: CC BY-SA / Gnu FDL

DBT3 Benchmark Results MyISAM

Introduction

This page shows the results for benchmarking the following configuration:

- MariaDB 5.3.2 + MyISAM
- MariaDB 5.5.18 + MyISAM

- MySQL 5.5.19 + MyISAM
- MySQL 5.6.4 + MyISAM

The test is performed using the automation script `/mariadb-tools/dbt3_benchmark/launcher.pl`.

Details about this automation script can be found on the DBT3 automation scripts page.

Hardware

The tests were performed on our `facebook-maria1` machine. It has the following parameters:

- CPU: 16 Intel® Xeon® CPU L5520 @ 2.27GHz
- Memory: Limited to 16 GB out of 72 by adding 'mem=16G' parameter to /boot/grub/menu.lst
- Logical disk: HDD 2 TB
- Operating system:

Scale factor 30

This test was performed with the following parameters:

- Scale factor: 30
- Query timeout: 2 hours
- Number of tests per query: 1
- Total DB size on disk: about 50GB
- Available memory: 16 GB

NOTE: The available memory is controlled by a parameter `mem=16G` added to the file `/boot/grub/menu.lst`

Steps to reproduce

Follow the instructions in DBT3 automation scripts to prepare the environment for the test.

Before you run the test, ensure that the settings in the test configuration files match your prepared environment. For more details on the test configuration, please, refer to the Test configuration parameters.

After the environment is prepared, the following command should be executed in the shell:

```
perl launcher.pl \
--results-output-dir=/home/mariadb/benchmark/dbt3/results/myisam_test \
--project-home=/home/mariadb/benchmark/dbt3/ \
--datadir=/home/mariadb/benchmark/dbt3/db_data/ \
--test=./tests/myisam_test_mariadb_5_3_mysql_5_5_mysql_5_6.conf \
--queries-home=/home/mariadb/benchmark/dbt3/gen_query/ --scale-factor=30 \
--TIMEOUT=7200
```

Compared configurations

The following configurations have been compared in this test:

Case 1: MariaDB 5.3.2 + MyISAM

Here are the common options that the mysqld server was started with:

```
net_read_timeout = 300
net_write_timeout = 600
key_buffer_size = 3G
skip-external-locking
key_buffer = 16M
max_allowed_packet = 16M
table_open_cache = 1024
thread_cache = 512
sort_buffer_size = 512K
net_buffer_length = 8K
read_buffer_size = 256K
read_rnd_buffer_size = 512K
myisam_sort_buffer_size = 8M
max_connections = 256
query_cache_size = 0
query_cache_type = 0
sql-mode = NO_ENGINE_SUBSTITUTION

#Per-test optimizations
optimizer_switch='index_merge=on'
optimizer_switch='index_merge_union=on'
optimizer_switch='index_merge_sort_union=on'
optimizer_switch='index_merge_intersection=on'
optimizer_switch='index_merge_sort_intersection=off'
optimizer_switch='index_condition_pushdown=on'
optimizer_switch='derived_merge=on'
optimizer_switch='derived_with_keys=on'
optimizer_switch='firstmatch=off'
optimizer_switch='loosescan=off'
optimizer_switch='materialization=on'
optimizer_switch='in_to_exists=on'
optimizer_switch='semijoin=on'
optimizer_switch='partial_match_rowid_merge=on'
optimizer_switch='partial_match_table_scan=on'
optimizer_switch='subquery_cache=off'
optimizer_switch='mrr=on'
optimizer_switch='mrr_cost_based=off'
optimizer_switch='mrr_sort_keys=on'
optimizer_switch='outer_join_with_cache=on'
optimizer_switch='semijoin_with_cache=off'
optimizer_switch='join_cache_incremental=on'
optimizer_switch='join_cache_hashed=on'
optimizer_switch='join_cache_bka=on'
optimizer_switch='optimize_join_buffer_size=on'
optimizer_switch='table_elimination=on'

join_buffer_space_limit = 3072M
join_buffer_size = 1536M
join_cache_level = 6
mrr_buffer_size = 96M
tmp_table_size = 96M
max_heap_table_size = 96M
```

Case 2: MariaDB 5.5.18 + MyISAM

Uses the same configuration file as MariaDB 5.3.2 in Case 1.

Case 3: MySQL 5.5.19 + MyISAM

Here are the common options that the mysqld server was started with:

```
net_read_timeout = 300
net_write_timeout = 600
key_buffer_size = 3G
skip-external-locking
key_buffer = 16M
max_allowed_packet = 16M
table_open_cache = 1024
thread_cache = 512
sort_buffer_size = 512K
net_buffer_length = 8K
read_buffer_size = 256K
myisam_sort_buffer_size = 8M
max_connections = 256
query_cache_size = 0
query_cache_type = 0
sql-mode = NO_ENGINE_SUBSTITUTION

join_buffer_size = 1536M
tmp_table_size = 96M
max_heap_table_size = 96M
read_rnd_buffer_size = 96M
```

Case 4: MySQL 5.6.4 + MyISAM

Here are the common options that the mysqld server was started with:

```
net_read_timeout = 300
net_write_timeout = 600
key_buffer_size = 3G
skip-external-locking
key_buffer = 16M
max_allowed_packet = 16M
table_open_cache = 1024
thread_cache = 512
sort_buffer_size = 512K
net_buffer_length = 8K
read_buffer_size = 256K
myisam_sort_buffer_size = 8M
max_connections = 256
query_cache_size = 0
query_cache_type = 0
sql-mode = NO_ENGINE_SUBSTITUTION

optimizer_switch='mrr=on'
optimizer_switch='mrr_cost_based=off'
optimizer_switch='batched_key_access=on'
optimizer_switch='index_condition_pushdown=on'

join_buffer_size = 1536M
tmp_table_size = 96M
max_heap_table_size = 96M
read_rnd_buffer_size = 96M
```

The server has been restarted between each query run and the caches have been cleared between each query run.

Results (without q20)

Here is the graphics of the results:

(Smaller bars are better)

NOTE: Queries that are cut off by the graphics have timed out the period of 2 hours.

Here are the actual results in seconds (smaller is better):

Configuration	1.sql	2.sql	2-opt.sql	3.sql	4.sql	5.sql	6.sql	7.sql	8.sql	9.sql	10.sql	11.sql	12.sql	13.sql	14.sql	15.sql	16.sql	17.sql	17-opt1.sql	17-opt2.sql	18.sql	18-opt.sql	19.sql	19-opt1.sql	19-opt2.sql	20.sql	21.sql	22.sql	Version	Query and explain details

NOTE: The columns named "*Ratio*" are calculated values of the ratio between the current value compared to the value in the first test configuration. The formula for it is `(current_value/value_in_first_row)`. For example if MariaDB 5.3.2 (the first column) handles a query for 100 seconds and MySQL 5.6.4 (the last configuration) handles the same query for 120 seconds, the ratio will be `120/100 = 1.20`. This means that it takes MySQL 5.6.4 20% more time to handle the same query.

The archived folder with all the results and details for that benchmark can be downloaded from here:MyISAM s30 on facebook-maria1

Notes

Queries 2-opt.sql and 18-opt.sql are tested only for MariaDB 5.3.2 and MariaDB 5.5.18

- Additional startup parameters for 2_opt:

```
--optimizer_switch='mrr_sort_keys=off'
```

- Additional startup parameters for 18_opt:

```
--optimizer_switch='semijoin=off' --optimizer_switch='index_condition_pushdown=on'
```

- Additional modifications for 17-opt1:

```
SELECT
SUM(l_extendedprice) / 7.0 AS avg_yearly
FROM
 part STRAIGHT_JOIN lineitem
WHERE
p_partkey = l_partkey
...
```

- Additional modifications for 17-opt2:

```
SELECT
    SUM(l_extendedprice) / 7.0 AS avg_yearly
FROM
    lineitem STRAIGHT_JOIN part
WHERE
    p_partkey = l_partkey
...
```

- Additional modifications for 19-opt1:

```
SELECT
    SUM(l_extendedprice* (1 - l_discount)) AS revenue
FROM
    part STRAIGHT_JOIN lineitem
WHERE
    (
        p_partkey = l_partkey
...
```

- Additional modifications for 19-opt2:

```
SELECT
    SUM(l_extendedprice* (1 - l_discount)) AS revenue
FROM
    lineitem STRAIGHT_JOIN part
WHERE
    (
        p_partkey = l_partkey
...
```

Benchmark for q20

This benchmarked only q20 with the same settings as described above for the other queries. The only difference is the timeout that was used: 30000 seconds
(8 hours and 20 min).

Compared cases

The benchmark for q20 compares the following cases:

- q20.sql - the original query is run with the IN-TO-EXISTS strategy for all servers.
  The following optimizer switches were used for MariaDB:

```
--optimizer_switch='in_to_exists=on,materialization=off,semijoin=off';
```

- q20-opt0.sql - the original query is changed so that the same join order is chosen as for the two subsequent variants that test materialization where this order is optimal.
  The join order is:

```
SELECT s_name, s_address
 FROM supplier, nation
 WHERE s_suppkey IN (SELECT DISTINCT (ps_suppkey)
 FROM '''part straight_join partsupp'''
 WHERE ps_partkey = p_partkey ...
```

- Since the IN-TO-EXISTS strategy is essentially the same for both MariaDB and MySQL, this query was tested for MySQL only.
- q20-opt1.sql - modifies the original query in two ways:
  - enforces the MATERIALIZATION strategy, and
  - enforces an optimal JOIN order via straight_join as follows:

```
SELECT s_name, s_address
 FROM supplier, nation
 WHERE s_suppkey IN (SELECT DISTINCT (ps_suppkey)
 FROM '''part straight_join partsupp'''
 WHERE ps_partkey = p_partkey ...
```

q20-opt1.sql uses the following optimizer switches for MariaDB:

```
--optimizer_switch='in_to_exists=off,materialization=on,semijoin=off';
```

- q20-opt2.sql - the same as q20-opt1.sql but allows the optimizer to choose the subquery strategy via the following switch:

```
--optimizer_switch='in_to_exists=on,materialization=on,semijoin=on';
```

- This switch results in the choice of SJ-MATERIALIZATION.

NOTE: For MySQL there are no such *optimizer-switch* parameters, and the tests were started without any additional startup parameters. The default algorithm in MySQL is *in_to_exists*.

Results for q20

Here is the graphics of the results of the benchmarked q20:
(Smaller bars are better)

NOTE: Queries that are cut off by the graphics have timed out the period of 30000 seconds.

Here are the actual results in seconds (smaller is better):

MariaDB 5.3 - Asynchronous I/O on Windows with InnoDB

Consider 2 pseudo-code implementation of event handling loop handling IO completion on Windows.

- Using Windows events

```
void io_thread() {
    HANDLE handles = new HANDLE[32];
    ...
    for (;;) {
       DWORD index = WaitForMultipleObjects(handles,32, FALSE);
       DWORD num_bytes;
       // Find file and overlapped structure for the index,
       GetOverlappedResult(file, overlapped, &num_bytes, TRUE);
       // handle io represented by overlapped
   }
```

- I/O Completion port based

```
void io_thread() {
    for (;;) {
       DWORD num_bytes;
       ULONG_PTR key;
       OVERLAPPED *overlapped;
       if (GetQueuedCompletionStatus(io_completion_port, &num_bytes,
            &key, &overlapped, INFINITE)) {
          // handle io represented by overlapped
      }
   }
```

Which one is more efficient ? The right answer is - I/O completion port based. This is because:

1. the number of outstanding events a thread can handle is not restricted by a constant like in the WaitForMultipleObject() case.
2. if there several io_handler() threads running, they load-balance since every I/O can be “dequeued” by GetQueuedCompletionStatus in any io handler thread. With WaitForMultipleObjects(), the thread that will dequeue the I/O result is predetermined for each I/O.

InnoDB has used asynchronous file I/O on Windows since the dawn of time, probably since NT3.1 . On some reason unknown to me (I can only speculate that Microsoft documentation was not good enough back then), InnoDB has always used method with events, and this lead to relatively complicated designs - if you’re seeing “segment” mentioning in os0file.c or fil0fil.c , this is mostly due to the fact that number of events WaitForMultipleObjects() can handle is fixed.

I changed async IO handling for XtraDB in MariaDB5.3 to use completion ports, rather than wait_multiple technique. The results of a synthetic benchmark are good.

The test that I run was sysbench 0.4 “update_no_key”

```
4       16      64      256     1024
mariadb-5.2             17812   22378   23436   7882    6043
mariadb-5.2-fix         19217   24302   25499   25986   25925
mysql-5.5.13            12961   20445   16393   14407   5343
```

I do understand, sysbench it does not resemble anything that real-life load, and I’m ready to admit cheating with durability for this specific benchmark, but this is an equal-opportunity cheating, all 3 versions ran with the same parameters.

What do I refer to as durability cheating:

1. using innodb_flush_log_at_trx_commit=0 , which, for me , is ok for many scenarios
2. “Switch off Windows disk flushing” setting, which has the effect of not flushing data in the disk controller (file system caching is not used here anyway). This setting is only recommended for battery backed disks, my own desktop does not have it, of course.

However, if I have not done the above, then I would be measuring the latency of a FlushFileBuffers() in my benchmark, which was not what I wanted. I wanted to stress the asynchronous IO.

And here is the obligatory graph:

Notes

This is taken from an original Facebook note from Vladislav Vaintroub, and it can be found: note.php?note_id=238687382817625

It is also worth noting a note from Vlad about the graph: “The graph is given for 5.2, because I developed that patch for 5.2. I pushed it into 5.3 though :)”

MariaDB 5.3/MySQL 5.5 Windows performance patches

I just backported Windows performance patches I’ve done for 5.5 back to MariaDB 5.3. There will be a bit more in Maria that in MySQL 5.5, but more on this later.

First, I feel Windows performance improvements in 5.5 were never adequately described, so here is the redux. For those familiar with Windows systems programming, MySQL code used to offer of low-hanging performance fruits. I picked some of them those back in my days in MySQL/Sun. The result benchmark curve became really nice: look at Calvin’s blog entry.

If graphs in this blog looks familiar to you, it is because it was often used by Oracle marketing as proof of big-O's positive influence on MySQL code :)

There were 3 Windows performance related patches. I comment on the bugs history a little bit, too.

- Bug#24509. The fix removed the limit of 2048 open MyISAM files, and as a nice side-effect allowed for much bigger table cache. When mysqld starts, it checks the maximum open files value, and corrects the value of table cache, if max_open_files is low or max_connection is high. This is what also happened during benchmarks. If you look at the read-only benchmark graph in the Calvin's blog above, you'll notice a drop around 64 concurrent users. No wonder, mysql server recalculated table cache size, setting it to the absolute minimum, that is to 64.

The fix was to create an own sort-of C runtime library on top of pure Win32, which is capable of handling more than 2048 open files (16K default). Some other things are also done nicer than in Microsofts C runtime, e.g there are no locks, and there is an acceptable pread()/pwrite() implementation. The main advantage as I said is being able to have a large table cache - for this, rewriting C runtime is likely an overkill, but I did not come up with anything better.

- Bug#52102. This bug was fixing a lot of questionable places in InnoDB that were written probably back in the NT3.1 days .

First it is importantto understand how innodb "mutex" structure is acquired. Details on it are hairy, mutex is a composite structure which has a real os mutex(known under Windows as CRITICAL_SECTION) plus innodb event (known under Windows as event). There are a couple of variations on the implementation - mutex can be an interlocked (aka atomic for my Unix friends) variable, under Unix event is represented as condition variable.

Acquisition is done in 2 steps - first, trylock on os mutex is performed , possibly several times with in a loop, if unsuccessful, event is reserved in a global table of events known as "sync array", event is entering a waiting state. mutex unlock would wakeup the waiters if there are any. Do not ask me why the implementation is so complicated, it is so :) Maybe, this design helps to find deadlocks.

Variation of this implementation - instead of trylock on mutex, there might be a compare_exchange instruction on interlocked(atomic) variable.

Back to Windows, the implementation of the above exposed a couple of interesting self-compensating bugs.

1. First, I fixed os_mutex_trylock() to be what it really means . The implementation was EnterCriticalSection, which is "try very hard", and actually acquire the lock. A more conscious trylock would be TryEnterCriticalSection. When I fixed that, contrary to my expectation, this made mysqld really slow. When trylock() failed, innodb started to enter code paths it has never seen before. for example, reserving space in the mentioned "sync array". Access to sync array is protected by so-called "slow lock" and this showed up very often in the profiler. The next step was fixing the "slow lock"
2. "slow Innodb mutex" was implemented as kernel object aka Windows mutex (for my Unix friends this is sort of SysV semaphore). It can be used to synchronize processes but is an absolute overkill for synchronization of threads inside the same process. It was a "really slow mutex". Changing this to CRITICAL_SECTION made it faster however…
3. When all of the above was fixed, found out that Windows events (mentioned events) did not really scale well in many-threads scenarios. On newer Windows (Vista+), there is a CONDITION_VARIABLE that is documented to scale better, and measuring also showed that it scaled really well. So I used condition variables when possible, which is ironic, because InnoDB events were really modeled after Windows events.
4. Re-enabled implementation of fast mutexes as atomic variables. Prior to the patch, precompiler flags to enable atomics were commented out with "Windows atomics do not work well" in CMakeLists.txt. Great comment, given that unlike software developers, atomic instructions have no preferences for the OSes they are being used on :)

So, the story about "atomics did not work well on Windows" was a cumulative effect of different things.

Prior to that patch . Once atomics were enabled, implementation of fast mutexes did not use CRITICAL_SECTION, but compare_exchange instruction. Ingenious "trylock_veryhard" as we have seen at the step 1. above is not used

anymore, instead it is a quite correct “try” lock . Once try_lock() began to fail with many concurrent threads, overhead of sync array guard implemented as Windows kernel object that we have seen in 2. became apparent, and less-then inefficient Windows events mentioned in 3. finished that picture.

- Bug#56585

This patch was merely to compensate for negative effects of the 5.5 metadata lock on MyISAM benchmarks, and fix was using native Vista performance primitives. The patch per se is not interesting, and repeats a lot of what was done for Innodb. What was great, was a discussion prior to the patch between myself, Davi, Dmitry on different implementations of reader writer locks, including 2 homebacked ones, and one by Vance Morrison.

Without doubt, the discussions around that was a highlight in my very short stint at Oracle. Also, if you want to get a MySQL-classic-style code review with 17 things to fix, of which at least 10 would be marked with “Coding Style” (yes, both words capitalized) , try to get Dmitry Lenev as a reviewer, he’s great - this is the proof 118295 Anyway, the patch improves MyISAM throughput by 10-20% , which I think is quite ok. Somehow those percents were subsequently eaten by MDL though :)

Performance of MEMORY Tables

Between MariaDB 5.5.21 and 5.5.22 some work was done on how the hash index for a MEMORY table is created. This results in better performance when inserting rows into a memory table.

The following benchmark compares MariaDB 5.5.21 and 5.5.25. Compiled with identical settings on the same machine. The operation was loading 50 million rows into a `MEMORY` table with LOAD DATA INFILE.

Two different tables were tested: one with an indexed INT column and one with an indexed CHAR(20) column. The data files were pre-generated and located on a SSD. In order to make the effect visible, the cpu speed was set to minimum (core I5 @ 800Mhz)

Result:

Table Type	MariaDB Version	rows per second	Percent
INT	5.5.21	411022	100%
	5.5.25	510016	124%
CHAR(20)	5.5.21	259399	100%
	5.5.25	411535	159%

This is how the benchmark was run:

```
MariaDB [test]> tee 5.5.21.txt
MariaDB [test]> set @instance="5.5.21";
MariaDB [test]> source bench.sql
```

The script used to generate the data files:

```
#!/usr/bin/perl -w

$ROWS=50*1024*1024;

open F, ">/tmp/hash1.txt" or die;
for ($i=0; $i<$ROWS; $i++) {
    printf F "%d\n", int(rand($ROWS));
}
close F or die;

open F, ">/tmp/hash2.txt" or die;
for ($i=0; $i<$ROWS; $i++) {
    $s="";
    for (1..20) { $s .= chr(ord('a')+int(rand(26))); }
    print F $s, "\n";
}
close F or die;
```

The benchmark SQL script `bench.sql`:

```
use test;

-- need big heap tables
set max_heap_table_size=4*1024*1024*1024;

-- table to hold test results
create table if not exists results (
  id serial,
  operation char(32),
  opsize bigint unsigned,
  started datetime,
  ended datetime,
  instance char(20)
);

-- dummy run with second data file
drop table if exists t1;
create table t1 (c1 char(20), index (c1)) engine memory;
load data infile "/tmp/hash2.txt" into table t1;
drop table t1;

-- do total of 5 runs for each table

-- run #1
create table t1 (c1 int, index (c1)) engine memory;
select @t1:=now();
load data infile "/tmp/hash1.txt" into table t1;
select @t2:=now();
select @rows:=count(*) from t1;
insert into results (operation, opsize, started, ended, instance)
values ("load into INT table", @rows, @t1, @t2, @instance);
drop table t1;

create table t1 (c1 char(20), index (c1)) engine memory;
select @t1:=now();
load data infile "/tmp/hash2.txt" into table t1;
select @t2:=now();
select @rows:=count(*) from t1;
insert into results (operation, opsize, started, ended, instance)
values ("load into CHAR(20) table", @rows, @t1, @t2, @instance);
drop table t1;

-- run #2
create table t1 (c1 int, index (c1)) engine memory;
select @t1:=now();
load data infile "/tmp/hash1.txt" into table t1;
select @t2:=now();
select @rows:=count(*) from t1;
insert into results (operation, opsize, started, ended, instance)
values ("load into INT table", @rows, @t1, @t2, @instance);
drop table t1;

create table t1 (c1 char(20), index (c1)) engine memory;

Recommended Settings for Benchmarks

Running benchmarks requires a lot of different settings. In this article we collect our best known settings and recommendations.

Hardware and BIOS Settings

We have had good experiences with Intel's hyperthreading on newer Xeon CPUs. Please turn on hyperthreading in your BIOS.

NUMA

The NUMA architecture attaches resources (most important: memory) to individual NUMA nodes (typically: NUMA node = cpu socket). This results in a performance penalty when a cpu core from one NUMA node accesses memory from another NUMA node.

The NUMA topology can be checked with the *numactl* command:

```
~ $numactl --hardware
available: 2 nodes (0-1)
node 0 cpus: 0 1 2 3 4 5 12 13 14 15 16 17
node 0 size: 12278 MB
node 0 free: 11624 MB
node 1 cpus: 6 7 8 9 10 11 18 19 20 21 22 23
node 1 size: 12288 MB
node 1 free: 11778 MB
node distances:
node   0   1
  0:  10  21
  1:  21  10
```

The Linux kernel uses ACPI tables from BIOS to detect if the hardware is NUMA. On NUMA hardware extra optimizations kick in:

- if a task has been scheduled on a certain NUMA node, the scheduler tries to put it on the same node again in the future
- if a task running on a certain NUMA node allocates memory, the kernel tries hard to map physical memory from the same NUMA node

This results in all kinds of weird behavior when you run one big process (mysqld) that consumes most of the memory. In such cases it is recommended to either turn off NUMA (BIOS or kernel command line) or prefix such problem processes with *numactl –interleave all*. You can enable this by running mysqld_safe with the `--numa-interleave` option.

More details can be found here.

Linux Kernel Settings

See configuring Linux for MariaDB.

InnoDB Settings

innodb_buffer_pool_size to about 80% of RAM or leaving <5G RAM free (on large RAM systems). Less if lots of connections are used.

innodb_log_file_size to be larger than the amount of writes in the test run or sufficient to cover several minutes of the test run at least.

MyISAM Settings

General Settings

threads_cache_size should be the same as max_connections (unless using thread pools).

RQG Performance Comparisons

Performance testing

The `performance/perfrun.pl` executes each query against a set of tw servers and reports the outcome.

```
perl performance/perfrun.pl --input-directory=... --dsn1=... --dsn2=... --output-file=... --filter=...
```

- `--input-directory` contains the queries to be run, one query per file. Alternative sources for queries will be made available in the future;
- `--dsn1` and `--dsn2` specify the locations of the two servers being compared in the Perl DBI URL format. If the queries are not fully qualified, the DSNs must contain the database name. The username and the password are also provided via the DSN. For example:

```
--dsn1=dbi:mysql:host=127.0.0.1:port=19300:user=root:database=test \
--dsn2=dbi:mysql:host=127.0.0.1:port=19302:user=root:database=test
```

- `--output-file=...` specifies a file where matching queries will be dumped in a form suitable for follow-up filtering with `perfreport`
- if no `--filter` is specified, all queries from the input will be reported;

Performance reporting

The `performance/perfreport.pl` script takes an output file created by `perfrun` and prints out its contents, possibly applying a filter in the process:

```
perl performance/perfreport.pl --input-file=... --filter=...
```

If no `--filter` is specified, all queries present in the input file are printed.

Filters

The queries reported by the system can be filtered out using perl-based filtering expressions. A filter can be applied during data collection, at which point it determines what information is stored in the output file and at

If you do not specify a filter, it is assumed that you want to output all queries.

The following variables can participate in filter expressions:

- Variables from `SHOW SESSION STATUS`, except:
  - variables that are not reset at the start of the query, which includes `Com_*`, `Uptime`, `Opened_files` and the like;
  - variables that relate to the operation of SSL encryption or the query cache;
- Variables from `SHOW GLOBAL STATUS LIKE 'Innodb_%'`

For each MySQL status variable, 4 Perl variables are provided
— the value of the MySQL variable from each server, their absolute difference and their ratio. For example, for the `Innodb_rows_read` MySQL variable, you can use `Innodb_rows_read1`, `Innodb_rows_read2`, `Innodb_rows_read_delta` and `Innodb_rows_read_ratio` in your Perl filter expressions.

In addition to the MySQL status variables, the framework provides the following additional variables:

- `$Execution_time{1|2|delta|ratio}` reports the time the query took to run from start to end in seconds. The value is truncated at milliseconds in order to prevent exorbitant performance ratios from being reported on very fast queries;
- `$Temperature` can either be `cold` or `warm` depending on whether the first execution of the query is being processed, or the second.
- `$Query` contains the text of the query, in order to enable filtering such as `$Query !~ m{l_receiptDATE}`

For example, the following command-line option:

```
--filter='($Execution_time1 > 0.1 || $Execution_time2 > 0.1) && $Temperature eq "warm"'
```

Will only process or report queries that took more than 0.1 sec to execute on a warm server.

On-screen Reporting Format

The ASCII on-screen reporting format is as follows:

```
Query: SELECT  l_linenumber FROM lineitem  WHERE l_suppkey  IN ( 10 , 1 ) AND l_shipdate NOT IN ( '1993-
06-06' , '1998-02-04' , '1992-01-08' ) AND l_linenumber NOT IN ( 8 , 7 ) AND l_quantity <> 3 AND (
l_orderkey NOT IN ( 1298 , 93 ) OR l_suppkey = 10 ) AND ( l_suppkey BETWEEN 4 AND 10 + 4 OR l_linenumber
= 2 AND l_commitDATE BETWEEN '1993-06-27' AND '1993-09-05' AND l_linenumber BETWEEN 3 AND 9 + 9 );
Cache: warm
                                  5.3.0-MariaDB-     5.2.6-MariaDB-          Delta              Ratio
-----------------------------------------------------------------------------------------------------
Execution time                             0.011s            0.004s           -0.007s            0.36
Innodb_buffer_pool_read_requests          2171              1836              -335               0.85
Handler_read_rnd                           583                 0              -583
Handler_read_next                          583               602                19               1.03
Innodb_rows_read                          1166               602              -564               0.52
```

Only variables whose values are different between the two servers are reported.
In this particular example, the query ran slower on `5.3.0-MariaDB` with warm cache and caused twice as many `Innodb_rows_read`.

On-disk Data Storage Format

The on-disk storage format is `Data::Dumper` objects, wrapped in `<![CDATA[ ... ]]>` tags, without the file being a full-blown XML. The serialized representation is created by `GenTest::QueryPerformanceDelta::serialize()` and is read by using `eval()` in `performance/perfreport.pl`

run-sql-bench.pl

`run-sql-bench.pl` is a perl script for automating runs of sql-bench
(You can find sql-bench in the MariaDB source code.)

`run-sql-bench.pl` can be found in the mariadb-tools project on Launchpad. Once you have a copy of mariadb-tools, you'll find the script, and its configuration directories, in the `sql-bench` directory. For the purposes of this article, wherever you located your local branch of `mariadb-tools` will be called `${BASE_DIR}`.

The `run-sql-bench.pl` script is located at '`${BASE_DIR}/sql-bench/run-sql-bench.pl`'.

Example configuration scripts used for different runs can be found in the various subdirectories of `${BASE_DIR}/sql-bench/`.

To run the `run-sql-bench.pl` script, do the following:

1. Branch a MariaDB or MySQL tree
2. Optionally do some code changes in that tree and commit your changes
3. Edit `run-sql-bench.pl` to set internal options, especially the "`my $path`" variable.
4. Create a `${BASE_DIR}/sql-bench/conf/host.cnf` file for your system. An easy way to do this is by duplicating one of the example `host.cnf` files:

```
cp -avi ${BASE_DIR}/sql-bench/conf/pitbull.cnf ${BASE_DIR}/sql-bench/conf/${HOSTNAME}.cnf
```

Edit the file to customize it for your system.

1. Create `${HOSTNAME}.cnf` files under the `${BASE_DIR}/sql-bench/basic`, `${BASE_DIR}/sql-bench/debug`, `${BASE_DIR}/sql-bench/debug-full`, and `${BASE_DIR}/sql-bench/O2` directories, depending on which automated tests you want to run. Use the example files as a base and customize them for your system.
2. Run the `run-sql-bench.pl` script:

```
cd ${BASE_DIR}/sql-bench/; ./run-sql-bench.pl --repository=[/path/to/bzr/repository] --sql-bench-options=
[additional sql-bench-options] --debug=[yes|no]
```

- `--repository` is the MariaDB tree to use and compile, the script will also look here for sql-bench.
- `--sql-bench-options` is mostly used in testing and debugging cases where we want to have short run times. For instance, using `--small-test` or `--small-table`.
- You can separate several sql-bench options with spaces like so:

```
--sql-bench-options="--small-test --small-table"
```

The results

Results are stored at the location specified by the `$sql_bench_results` variable in the `${BASE_DIR}/sql-bench/conf/hostname.cnf` file for your host.
Results are organized in sub directories with the following schema:

```
sql-bench-results-dir/${HOSTNAME}/YYYY-MM-DD
```

Future plans

- Crash and error detection and reporting.
- One should be able to specify a test name for each file (`run-all-tests --suffix='_xxxx'`)

This page is licensed: CC BY-SA / Gnu FDL

Segmented Key Cache Performance

Testing method for segmented key cache performance

We used SysBench v0.5 from Launchpad to test the segmented key cache performance for the MyISAM storage engine of MariaDB 5.2.2-gamma.

As wrapper scripts for automated running of SysBench we used the `sysbench/` directory from MariaDB Tools.

To test that splitting the key cache's global mutex into several mutex helps under multi user load, we wrote a new SysBench test called `select_random_points.lua`. We used one big table and selected random points with increasing number of concurrent users.

Main testing outcomes

We see up to 250% performance gain depending on the amount of concurrent users.

Detailed testing outcomes

On our machine pitbull

On pitbull with –random-points=10

In relative numbers:

```
Threads                1      4      8      16      32      64      128
(32/off)             -3%    53%    122%    155%    226%    269%    237%

select_random_points.lua --random-points=100
```

Detailed numbers of all runs on perro

You can find the absolute and relative numbers in our OpenOffice.org spread sheet here: SysBench v0.5 select_random_points on perro

Table and query used

Table definition:

```
CREATE TABLE sbtest (
  id  INT UNSIGNED NOT NULL AUTO_INCREMENT,
  k   INT UNSIGNED NOT NULL DEFAULT '0',
  c   CHAR(120) NOT NULL DEFAULT '',
  pad CHAR(60) NOT NULL DEFAULT '',
  PRIMARY KEY (id),
  KEY k (k)
) ENGINE=MyISAM
```

Query used:

```
SELECT id, k, c, pad
    FROM sbtest
    WHERE k IN (?, ?, ?, ?, ?, ?, ?, ?, ?, ?)
```

The `?` parameters were replaced by random numbers when running the SysBench test. We used 10, 50, and 100 random points in our tests.

We inserted 20 million rows using random data, which gave us a data and index file size of:

```
3.6G    sbtest.MYD
313M    sbtest.MYI
```

We chose our key buffer size to be big enough to hold the index file.

Testing environment

MariaDB sources

We used MariaDB 5.2.2-gamma with following revision from our launchpad repository Revision #2878

```
revno: 2878
committer: Sergei Golubchik <sergii@pisem.net>
branch nick: 5.2
timestamp: Tue 2010-10-26 07:37:44 +0200
message:
  fixes for windows
```

Compiling MariaDB

We compiled MariaDB using this line:

```
BUILD/compile-amd64-max
```

MariaDB runtime options

We used following configuration for running MariaDB

```
MYSQLD_OPTIONS="--no-defaults \
  --datadir=$DATA_DIR \
  --language=./sql/share/english \
  --log-error \
  --key_buffer_size=512M \
  --max_connections=256 \
  --query_cache_size=0 \
  --query_cache_type=0 \
  --skip-grant-tables \
  --socket=$MY_SOCKET \
  --table_open_cache=512 \
  --thread_cache=512 \
  --key_cache_segments=0 \ # 0 | 32 | 64
  --tmpdir=$TEMP_DIR"
```

SysBench v0.5 select_random_points.lua options

We run the SysBench v0.5 select_random_points.lua test with following options:

```
# 20 million rows.
TABLE_SIZE=20000000

SYSBENCH_OPTIONS="--oltp-table-size=$TABLE_SIZE \
  --max-requests=0 \
  --mysql-table-engine=MyISAM \
  --mysql-user=root \
  --mysql-engine-trx=no \
  --myisam-max-rows=50000000 \
  --rand-seed=303"
```

We tested with increasing number of concurrent users with a warm up time of 8 minutes and a run time of 20 minutes:

```
NUM_THREADS="1 4 8 16 32 64 128"
...
  --num-threads=$THREADS
```

We also tested an increasing number of random points:

```
# Default option is --random-points=10.
SYSBENCH_TESTS[0]="select_random_points.lua"
SYSBENCH_TESTS[1]="select_random_points.lua --random-points=50"
SYSBENCH_TESTS[2]="select_random_points.lua --random-points=100"
```

Kernel parameters

IO scheduler

For optimal IO performance running a database we are using the noop scheduler. You can check your scheduler setting with:

```
cat /sys/block/${DEVICE}/queue/scheduler
```

For instance, it should look like this output:

```
cat /sys/block/sda/queue/scheduler
[noop] deadline cfq
```

You can find detailed notes about Linux schedulers here: Linux schedulers in TPCC like benchmark.

Open file limits

Having a lot of concurrent connections can hit the open file limit on your system. On most Linux systems the open file limit is at 1024, which can be not enough. Please set your open file limit higher by editing

```
$EDITOR /etc/security/limits.conf
```

and adding a line like

```
#ftp            hard    nproc           0
#@student       -       maxlogins       4
*               -       nofile          16384

# End of file
```

Your `ulimit -a` output should look like this afterwards:

```
ulimit -a
core file size          (blocks, -c) 0
data seg size           (kbytes, -d) unlimited
scheduling priority             (-e) 0
file size               (blocks, -f) unlimited
pending signals                 (-i) 15975
max locked memory       (kbytes, -l) 64
max memory size         (kbytes, -m) 1744200
open files                      (-n) 16384
```

Machines used for testing

perro

```
# OS: openSUSE 11.1 (x86_64)
# Platform: x86_64
# CPU: Quad-core Intel @ 3.20GHz: 4 CPUs
# RAM: 2GB
# Disk(s): 2 x ST31000528AS S-ATA as software RAID 0
```

pitbull

```
# OS: Ubuntu 10.10
# Platform: x86_64
# CPU: Two-socket x hexa-core Intel Xeon X5660 @ 2.80GHz. With hyperthreading: 24CPUs
# RAM: 28GB
# Disk(s): 1 x ST3500320NS S-ATA
```

This page is licensed: CC BY-SA / Gnu FDL

sysbench Benchmark Setup

For our automated MariaDB/MySQL sysbench benchmark tests, we use sysbench from `lp:sysbench`. This page describes the basic parameters and configuration we use.

You can find the automation wrapper scripts we use for running sysbench in lp:mariadb-tools

Current general parameters

```
table_open_cache = 512
thread_cache = 512
query_cache_size = 0
query_cache_type = 0
```

Current InnoDB parameters

```
innodb_data_home_dir = /data/mysql/
innodb_data_file_path = ibdata1:128M:autoextend
innodb_log_group_home_dir = /data/mysql/
innodb_buffer_pool_size = 1024M
innodb_additional_mem_pool_size = 32M
innodb_log_file_size = 256M
innodb_log_buffer_size = 16M
innodb_flush_log_at_trx_commit = 1
innodb_lock_wait_timeout = 50
innodb_doublewrite = 0
innodb_flush_method = O_DIRECT
innodb_thread_concurrency = 0
innodb_max_dirty_pages_pct = 80
```

Compile

Install MariaDB or MySQL to /usr/local and make a symlink to /usr/local/mysql.
Please use non-debug version! On Mac OS X we currently need automake1.10.

```
./autogen.sh
./configure \
  --without-drizzle \
  --with-mysql-includes=/usr/local/mysql/include/mysql \
  --with-mysql-libs=/usr/local/mysql/lib/mysql
make
optionally: make install
```

Start and prepare database to use

```
mysqladmin -uroot drop sbtest
mysqladmin -uroot create sbtest
```

Tests

We use the latest sysbench with Lua scripting support. Therefore the test names differ from sysbench <= 0.4. To get reasonable results we use a run time of 5 minutes.

We run the tests with 1, 4, 8, 16, 32, 64, and 128 threads.

```
NUM_THREADS="1 4 8 16 32 64 128"
SYSBENCH_TESTS="delete.lua \
  insert.lua \
  oltp_complex_ro.lua \
  oltp_complex_rw.lua \
  oltp_simple.lua \
  select.lua \
  update_index.lua \
  update_non_index.lua"

NUM_THREADS=1
TEST_DIR=${HOME}/work/monty_program/sysbench/sysbench/tests/db

./sysbench \
  --test=${TEST_DIR}/oltp_simple.lua \
  --oltp-table-size=2000000 \
  --max-time=300 \
  --max-requests=0 \
  --mysql-table-engine=InnoDB \
  --mysql-user=root \
  --mysql-engine-trx=yes \
  --num-threads=$NUM_THREADS \
  prepare

./sysbench \
  --test=${TEST_DIR}/oltp_simple.lua \
  --oltp-table-size=2000000 \
  --max-time=300 \
  --max-requests=0 \
  --mysql-table-engine=InnoDB \
  --mysql-user=root \
  --mysql-engine-trx=yes \
  --num-threads=$NUM_THREADS \
  run
```

Custom added tests

We created a couple of custom tests for SysBench:

- select_random_ranges.lua
- select_random_points.lua

Both of these have been added to the latest SysBench v0.5 repository.

10.0.36 Release Upgrade Tests

Tested revision

e023f9a4d5a620b54d7f7132567150d80b630692

Test date

2018-08-05 19:08:18

Summary

Two tests failed due to problems in previous versions (unrelated to the release)

Details

Upgrade from 10.1

Tested revision

adc91387e3add6d9c850b7c2a44760deaceb3638

Test date

2017-03-05 18:09:10

Summary (FAIL)

34 failures out of 1280 combinations, all associated with MDEV-9422 (crash-upgrade from 10.1.10 with encryption enabled)

10.1.26 Release Upgrade Tests

10.1.30 Release Upgrade Tests

Tested revision

461cf3e5a3c2d346d75b1407b285f8daf9d01f67

Test date

2017-12-23

Summary

Some tests failed with known bug MDEV-13112. Undo upgrade from 10.0.18 failed because the old server hang on shutdown (a known problem with old servers). Crash upgrade from 10.1.10 (4K, zlib, XtraDB, Barracuda) failed (MDEV-14759).

10.1.32 Release Upgrade Tests

Tested revision

4d83b01537e3f1eb257a8e9a6416938e03adea59

Test date

2018-04-17 01:44:10

Summary

Known bug MDEV-13112. A few upgrades from MySQL and old MariaDB fail because the old versions hang on shutdown.

10.2.12 Release Upgrade Tests

Tested revision

d361401bc26f49480daec8b0307afff6edae2ecc

Test date

2018-01-07 07:34:24

Summary

Some tests failed due to MDEV-13103, MDEV-13094 as usual. Crash recovery with encryption also fails due to MDEV-13103.

10.2.13 Release Upgrade Tests

Tested revision

00f0c039d2f4213ccf0a0202349ecb162a799989

Test date

2018-02-15 22:17:40

Summary

Some tests failed due to MDEV-13103, MDEV-13094 as usual.

10.2.14 Release Upgrade Tests

Tested revision

b3cdafcb93da2e57d49f26f0846dc957458ee72c

Test date

2018-04-17 05:25:43

Summary

Known bugs MDEV-13103, MDEV-13094. A few upgrades from MySQL and old MariaDB fail because the old versions hang on shutdown.

10.2.17 Release Upgrade Tests

Tested revision

5553d3f1f691a374124686946bd1f1cc4ef9fb45

Test date

2018-08-30 01:21:02

Summary

Known bug MDEV-13094. A few upgrades from MySQL and old MariaDB fail because the old versions hang on shutdown.

10.2.18 Release Upgrade Tests

Tested revision

2dfb4a8abe3af501f8a6780ed782a2eee5e6f6d5

Test date

2018-10-03 13:37:05

Summary

Few unrelated failures due to bugs in previous versions

Details

10.2.5 Pre-release Upgrade Tests

Upgrade from 10.0

Tested revision

b56262f69677fdb158b3d19dd8848e5802b2dd27

Test date

2017-03-27 02:05:09

Summary (PASS)

All tests passed

Details

10.3.10 Release Upgrade Tests

Tested revision

bad2f1569da57c4a81cc84ec2f4a79924df9c8d6

Test date

2018-10-04 23:04:05

Summary

Known bug MDEV-13094. A few upgrades from MySQL and old MariaDB fail because the old versions hang on shutdown

Details

10.3.3-beta Release Upgrade Tests

Tested revision

52c40b406d5a68bf774a75dc6fa9ef1c166b22b1

Test date

2017-12-24

Summary

Some tests failed due to the known bug MDEV-13103. Crash upgrade from 10.3.2 fails due to an incompatible change (removal of MLOG_UNDO* record types), allowed for Alpha=>Beta transition.

10.3.4-beta Release Upgrade Tests

Tested revision

8f102b584d4e8f02da924f9be094014136eb453f

Test date

2018-01-19 17:39:10

Summary

All major upgrades fail with MDEV-14990 (non-InnoDB issue, general server). Also known bugs MDEV-13103, MDEV-13094

10.3.5-gamma Release Upgrade Tests

Tested revision

583eb96c2492adb87e88a014b24eb0724fb00257

Test date

2018-03-11 12:40:20

Summary

Known bugs MDEV-13103, MDEV-13094. A few upgrades from MySQL and old MariaDB fail because the old versions hang on shutdown

10.3.6-gamma Release Upgrade Tests

Tested revision

560743198604caf677c543db9719cef871df09ce

Test date

2018-04-17 10:50:21

Summary

One new (previously unknown) bug MDEV-15912. Known bugs MDEV-13103, MDEV-13094. One failure identified as a deadlock of yet unknown origin, could be a side-effect of known bugs. A few upgrades from MySQL and old MariaDB fail because the old versions hang on shutdown.

Details

10.3.9 Release Upgrade Tests

Tested revision

ca26f91bcaa21933147974c823852a2e1c2e2bd7

Test date

2018-08-30 07:09:44

Summary

Known bug MDEV-13094. A few upgrades from MySQL and old MariaDB fail because the old versions hang on shutdown.

DBT-3 Dataset

This page describes our setup for DBT-3 tests. A very cogent resource on the DBT3 Benchmark is also available. See also dbt-3-queries

Get and compile DBT3

- Get DBT3
- Make sure that you have pg_ctl and createdb of PostgreSQL installed. On Ubuntu look for postgresql and postgresql-client and make sure that pg_ctl is in your PATH, for instance:

```
PATH=/usr/lib/postgresql/8.4/bin:$PATH
```

- Compile DBT3

```
gunzip -c dbt3-1.9.tar.gz | tar xvf -
cd dbt3-1.9
./configure
make
cd src/dbgen
make
```

- Generate data:

```
./dbgen -s30
```

DDL

Substitute `${ENGINE}` with the storage engine you want to use:

```
CREATE TABLE supplier (
  s_suppkey  INTEGER PRIMARY KEY,
  s_name CHAR(25),
  s_address VARCHAR(40),
  s_nationkey INTEGER,
  s_phone CHAR(15),
  s_acctbal REAL,
  s_comment VARCHAR(101)) Engine ${ENGINE};

CREATE TABLE part (
  p_partkey INTEGER PRIMARY KEY,
  p_name VARCHAR(55),
  p_mfgr CHAR(25),
  p_brand CHAR(10),
  p_type VARCHAR(25),
  p_size INTEGER,
  p_container CHAR(10),
  p_retailprice REAL,
  p_comment VARCHAR(23)) Engine ${ENGINE};

CREATE TABLE partsupp (
  ps_partkey INTEGER,
  ps_suppkey INTEGER,
  ps_availqty INTEGER,
  ps_supplycost REAL,
  ps_comment VARCHAR(199),
  PRIMARY KEY (ps_partkey, ps_suppkey)) Engine ${ENGINE};

CREATE TABLE customer (
  c_custkey INTEGER PRIMARY KEY,
  c_name VARCHAR(25),
  c_address VARCHAR(40),
  c_nationkey INTEGER,
  c_phone CHAR(15),
  c_acctbal REAL,
  c_mktsegment CHAR(10),
  c_comment VARCHAR(117))  Engine ${ENGINE};

CREATE TABLE orders (
  o_orderkey INTEGER PRIMARY KEY,
  o_custkey INTEGER,
  o_orderstatus CHAR(1),
  o_totalprice REAL,
  o_orderDATE DATE,
  o_orderpriority CHAR(15),
  o_clerk CHAR(15),
  o_shippriority INTEGER,
  o_comment VARCHAR(79))  Engine ${ENGINE};

CREATE TABLE lineitem (
  l_orderkey INTEGER,
  l_partkey INTEGER,
  l_suppkey INTEGER,
  l_linenumber INTEGER,
  l_quantity REAL,
  l_extendedprice REAL,
  l_discount REAL,
  l_tax REAL,
  l_returnflag CHAR(1),
  l_linestatus CHAR(1),
  l_shipDATE DATE,
  l_commitDATE DATE,
  l_receiptDATE DATE,
  l_shipinstruct CHAR(25),
  l_shipmode CHAR(10),
  l_comment VARCHAR(44),
  PRIMARY KEY (l_orderkey, l_linenumber)) Engine ${ENGINE};
```

```
CREATE TABLE nation (
  n_nationkey INTEGER PRIMARY KEY,
  n_name CHAR(25),
  n_regionkey INTEGER,
  n_comment VARCHAR(152)) Engine ${ENGINE};

CREATE TABLE region (
  r_regionkey INTEGER PRIMARY KEY,
  r_name CHAR(25),
  r_comment VARCHAR(152)) Engine ${ENGINE};

CREATE TABLE time_statistics (
  task_name VARCHAR(40),
  s_time TIMESTAMP,
  e_time TIMESTAMP,
  int_time INTEGER)  Engine ${ENGINE};
```

Load data

Substitute `${DATA_DIR}` with the path to your generated data.

```
LOAD DATA LOCAL INFILE '${DATA_DIR}/supplier.tbl' into table supplier fields terminated by '|';
  LOAD DATA LOCAL INFILE '${DATA_DIR}/part.tbl' into table part fields terminated by '|';
  LOAD DATA LOCAL INFILE '${DATA_DIR}/partsupp.tbl' into table partsupp fields terminated by '|';
  LOAD DATA LOCAL INFILE '${DATA_DIR}/customer.tbl' into table customer fields terminated by '|';
  LOAD DATA LOCAL INFILE '${DATA_DIR}/orders.tbl' into table orders fields terminated by '|';
  LOAD DATA LOCAL INFILE '${DATA_DIR}/lineitem.tbl' into table lineitem fields terminated by '|';
  LOAD DATA LOCAL INFILE '${DATA_DIR}/nation.tbl' into table nation fields terminated by '|';
  LOAD DATA LOCAL INFILE '${DATA_DIR}/region.tbl' into table region fields terminated by '|';
```

Indexes we need

```
ALTER TABLE lineitem
  ADD INDEX i_l_shipdate(l_shipdate),
  ADD INDEX i_l_suppkey_partkey (l_partkey, l_suppkey),
  ADD INDEX i_l_partkey (l_partkey),
  ADD INDEX i_l_suppkey (l_suppkey),
  ADD INDEX i_l_receiptdate (l_receiptdate),
  ADD INDEX i_l_orderkey (l_orderkey),
  ADD INDEX i_l_orderkey_quantity (l_orderkey, l_quantity),
  ADD INDEX i_l_commitdate (l_commitdate);

CREATE INDEX i_c_nationkey ON customer (c_nationkey);

ALTER TABLE orders
  ADD INDEX i_o_orderdate (o_orderdate),
  ADD INDEX i_o_custkey (o_custkey);

CREATE INDEX i_s_nationkey ON supplier (s_nationkey);

ALTER TABLE partsupp
  ADD INDEX i_ps_partkey (ps_partkey),
  ADD INDEX i_ps_suppkey (ps_suppkey);

CREATE INDEX i_n_regionkey ON nation (n_regionkey);
```

Analyze tables

```
ANALYZE TABLE supplier;
ANALYZE TABLE part;
ANALYZE TABLE partsupp;
ANALYZE TABLE customer;
ANALYZE TABLE orders;
ANALYZE TABLE lineitem;
ANALYZE TABLE nation;
ANALYZE TABLE region;
```

DBT-3 Queries

Q1

See MDEV-4309 (just speeding up temptable-based GROUP BY execution). Optimizer seems to make a good choice here.

```
SELECT
        l_returnflag,
        l_linestatus,
        SUM(l_quantity) AS sum_qty,
        SUM(l_extendedprice) AS sum_base_price,
        SUM(l_extendedprice * (1 - l_discount)) AS sum_disc_price,
        SUM(l_extendedprice * (1 - l_discount) * (1 + l_tax)) AS sum_charge,
        AVG(l_quantity) AS avg_qty,
        AVG(l_extendedprice) AS avg_price,
        AVG(l_discount) AS avg_disc,
        COUNT(*) AS count_order
FROM
        lineitem
WHERE
        l_shipdate <= date_sub('1998-12-01', INTERVAL 63 DAY)
GROUP BY
        l_returnflag,
        l_linestatus
ORDER BY
        l_returnflag,
        l_linestatus
```

Q4

See MDEV-6015.

Applicable optimizations:

- subquery cache brings no benefit because subquery refers to outer_table.pk, which is different for each row
- EXISTS-to-IN is applicable
  - After that, BKA brings slight speedup

Comments on query plan choice

- It seems, we're using the best possible query plan here.

```
SELECT
    o_orderpriority,
    COUNT(*) AS order_count
FROM
    orders
WHERE
    o_orderdate >= '1995-06-06'
    AND o_orderdate < date_add('1995-06-06', INTERVAL 3 MONTH)
    AND EXISTS (
        SELECT
            *
        FROM
            lineitem
        WHERE
            l_orderkey = o_orderkey
            AND l_commitdate < l_receiptdate
    )
GROUP BY
    o_orderpriority
ORDER BY
    o_orderpriority;
```

OpenStreetMap Dataset

This page describes how to use the OpenStreetMap dataset in testing.

Database Schema

The database schema is available here. To import:

```
mysqladmin create osm
cat osmdb06.sql | mysql osm
```

By default, this schema uses a mixture of InnoDB and MyISAM tables. To convert all tables to Aria:

```
sed -i -e 's/InnoDB/Aria/gi' osmdb06.sql
sed -i -e 's/MyISAM/Aria/gi' osmdb06.sql
```

30 tables are created.

Data

The data is provided in the form of XML files (.OSM files) that require the Java-based Osmosis tool to load into MariaDB. The tool is available from dev.openstreetmap.org. Version 0.36 is known to work.

Various .OSM files are available, including the entire world (>200Gb unzipped) and individual countries.

Data is loaded with the following command-line (in the example, we're using the bulgaria.osm file, replace with the file you choose):

```
chmod +x bin/osmosis
bin/osmosis --read-xml file=bulgaria.osm --write-apidb dbType="mysql" host="localhost:port"
validateSchemaVersion=no database="osm" user="root" password="<password-goes-here>"
```

Data is inserted into 19 tables, as follows:

```
MariaDB [(none)]> use information_schema;
Reading table information for completion of table and column names
You can turn off this feature to get a quicker startup with -A

Database changed
MariaDB [information_schema]> select TABLE_NAME, TABLE_ROWS from TABLES
    -> where TABLE_ROWS > 0
    -> AND
    -> TABLE_SCHEMA='osm'
    -> ORDER BY TABLE_ROWS DESC;
+--------------------------+------------+
| TABLE_NAME               | TABLE_ROWS |

Jira - Status and Transition Definitions

Here is the MariaDB Server (MDEV) Jira project workflow.

OPEN

- Status assigned to newly created Jira issues
- Indicates that the issue has been reported and awaits further action
- Transitions
  - Needs feedback → NEEDS FEEDBACK
  - Start progress → IN PROGRESS
  - Close Issue → CLOSED

CONFIRMED

- Status applied to validate the existence of a bug type of issue
- Implies that the bug can be consistently reproduced and is scheduled for development
- Transitions
  - Stop Progress → STALLED
  - Request testing → IN TESTING
  - Needs feedback → NEEDS FEEDBACK
  - Close Issue → CLOSED
  - Request Review → IN REVIEW

NEEDS FEEDBACK

- Status utilised when progress is contingent on receiving essential feedback
- Feedback requests should be clearly communicated to the designated individual
- Issue can be closed after staying in a month in NEED FEEDBACK with no activity
- Transitions
  - Provide feedback → OPEN
  - No Feedback → CLOSED

IN PROGRESS

- Status employed when the assignee is actively working on the issue
- Denotes that the issue is being actively addressed and moving forward
- Transitions
  - Stop Progress → STALLED
    - From the end of 2023, we are moving the issues “IN PROGRESS”, which didn’t get any time to get meaningful updates from the assignee for 6 weeks in this status, to STALLED.
  - Request testing → IN TESTING
  - Needs feedback → NEEDS FEEDBACK
  - Close Issue → CLOSED
  - Request Review → IN REVIEW

IN REVIEW

- Status used to request a peer review of an issue, typically involving code evaluation
- Seeking input from another assignee to ensure quality and adherence to standards
- Transitions
  - Review done → STALLED
  - Request testing → IN TESTING
  - Close Issue → CLOSED

IN TESTING

- Status employed to initiate testing of completed work, often involving a quality engineer
- Ensuring that the implemented solution meets functional and performance requirements
- Transitions
  - Stop Testing → STALLED
  - Close Issue → CLOSED

STALLED

- Status indicating that progress on the issue has been temporarily halted
- Distinguished from the Open status by the presence of prior work on the stalled issue
- Transitions
  - Unconfirm issue → OPEN
  - Request testing → IN TESTING
  - Needs Feedback → NEEDS FEEDBACK
  - Start Progress → IN PROGRESS
  - Close Issue → CLOSED
  - Request Review → IN REVIEW

CLOSED

- Status assigned when work on the issue has been finalized
- Signifies that the issue has been successfully resolved and no further action is expected
- In the event that the issue requires reopening, it will revert to the Stalled status
- The resolution is another field that will explain how it has been resolved.
- Transitions
  - Reopen Issue → STALLED

Jira - Project Planning and Tracking

Jira is the tool that is used for bug reporting, project planning and tracking in MariaDB development. It replaced the previous tool called WorkLog. Jira is also where you can find the MariaDB roadmap.

The MariaDB Jira is located at jira.mariadb.org

Everyone is welcome to sign up for a free account and submit issues, post new tasks or ideas, or to comment on existing issues. The sign up can be found next to the log in boxes on the front page or directly through this link.

After filling out the sign up form you can log in.

Links to Jira Tasks

You can easily create links to Jira tasks in the documentation using their “MDEV” number. For example, the text ‘`mdev-191`’, when entered into the documentation becomes: MDEV-191.

Profiling with Linux perf tool

Linux `perf` tool can be used to do non-intrusive profiling.

Frequency Based Sampling

This mechanism can be used to answer the question, what is MariaDB doing on my CPU.

Recording a sample

Perf records at a high frequency, so only a short recording is sufficient to answer the question. If this is too short adjust the frequency at which perf does its recordings.

```
sudo perf record -p ${pidof mysqld} -g -o sample.perf -- sleep 5
```

The `-g` option here records the calling stack. Because seeing time in a mutex function isn't particularly interesting without knowing which mutex it is.

Viewing a sample

To view a recording, you need the debug symbols for your executable. See this page on getting the debug symbols available.

Changing the ownership of the recording means you can run perf report without sudo.

This shows where in the process MariaDB is spending most of its time at the top level. MariaDB uses threads per user connection so this will usually show a significant time in a `handle_connection` function. There are background threads that also run, so this can quickly show if its connection related time or a background thread.

```
sudo chown $USER: sample.perf
perf report -i sample.perf -g
```

To see which low level functions are consuming the most time, `--no-children` means that each function listed include only the time that is being spend it this function and excluding the other functions it calls.

```
perf report -i sample.perf -g --no-children
```

Expanding out the function shows the complete call stack again. Multiple functions may have called the function you are looking at so there may be a different frequency breakdown.

A more complete example of performance analysis using perf is on this Percona community blog article.

Dynamic Tracepoints

Adding dynamic tracepoints

One can add tracepoints at function entry/exit (and other locations too):

```
sudo perf probe -x /path/to/ha_rocksdb.so  --add rocksdb_prepare
sudo perf probe -x /path/to/ha_rocksdb.so  --add rocksdb_prepare%return
```

Viewing the tracepoints

```
sudo perf probe -l
```

Running the profiler

Something like:

```
perf record -e 'probe_ha_rocksdb:*' -a -- sleep 60
```

Note: `-a` means system-wide.

There's also `-p $PID` option

```
perf record -e 'probe_ha_rocksdb:*' -p $(pidof mysqld) -- sleep 60
```

Examining the trace

```
perf script
```

Worklog

Worklog has been replaced, please refer to JIRA - project planning and tracking for further information.

Worklog is the tool used to track all development of MariaDB.

The MariaDB Worklog is open to everyone at index.pl (a free account on the developer wiki is required to suggest new tasks and add comments, votes, donations etc.). The account signup page for the wiki is here.

If you find something in the worklog that you really would like to have done, you can commit to donate some money to the developer when this is done. (Search after "Make offer" on the worklog item you would like to sponsor).

If there is something in worklog which you would like to develop, you can contact us at 'maria-developers (at) lists.launchpad.com' or 'community (at) askmonty.org'. If you deliver a working solutions that is accepted into the MariaDB source tree, you will get 60 % of the so far committed money. The rest of the money is kept by MariaDB Corporation Ab for help managing the project, code reviews, bug fixes, testing, maintenance, updates and merges to future MariaDB versions.

You can also add a link in the MariaDB worklog to tasks to the MySQL worklog. Just refer to the MySQL task as #WL

Source Code for Worklog

The source code for the Worklog application is hosted on Launchpad. The license is GPL.

About Buildbot

Overview

The goal of MariaDB Foundation Buildbot is to ensure that the MariaDB Server is being thoroughly tested on all supported platforms and environments. We are currently running 100 different configurations for the following platforms:

- x64 and x86
- aarch64
- ppc64le
- s390x

and operating systems:

- Debian 9, 10, 11 and Sid
- Ubuntu 16.04, 18.04, 20.04 and 21.04
- Fedora 33 and 34
- CentOS 7 and 8
- RHEL 7 and 8
- SLES 12 and 15
- OpenSUSE 15 and 42
- Windows
- AIX-7.2

Moreover, we run other ecosystem tests for:

- PHP
- DBdeployer
- MySqlJS
- PyMySQL

Packages built by buildbot can be downloaded from here.

What is Buildbot?

The MariaDB Foundation uses Buildbot, a continuous integration and testing framework to test and create MariaDB Server packages. It is hosted onand ensures that each push to the MariaDB Server GitHub repository is properly tested.

Who uses Buildbot?

Buildbot should be used by each MariaDB developer to ensure that the new changes that are made are properly tested on all supported platforms and environments. In order to enforce this, Buildbot is used for branch protection. However, even though branch protection is enabled, **only a selected few** builders are part of it. So, it is the

developer’s responsibility to monitor all the builders and make sure that everything is fine before making the final push to the main MariaDB branch.

Buildbot keywords

- Changes/Repository - Any change that occurs in the source code (commit)
- Build Master - The main process that runs on a dedicated machine. It checks for changes in the source code and is in charge of scheduling builds
- Build - The actual configuration that is tested. It consists of a sequence of steps that define the actual test (e.g. get source code, compile, run tests, etc)
- Buildbot Worker - The process which waits for commands from the Build Master in order to run a build

How does the Buildbot work?

As it comes to the Buildbot Master, we use a multi-master configuration. This means that we have multiple running master processes. So, we have a dedicated master for the user interface and several other that deal with looking for changes and scheduling builds.

Each time a push is made to the MariaDB Server Repository, it is detected by the buildbot master which schedules all the builds. Each build defines a different test configuration. We mainly use Docker Latent Workers which means that for each build, the master starts a Docker container on a remote machine. The container is configured to run the buildbot-worker process on startup. This process can now receive instructions from the master. In this way, by using latent workers there isn’t a buildbot-worker process continuously running on the worker machine. Instead, for each build a separate container is started.

Below, you can find a detailed step by step overview of what happens after a push is made to the MariaDB Server repository:

- Step 1: Detect a new change in the MariaDB Server repository
  - Trigger source tarball creation
- Step 2: Tarball creation
  - Clone the repository and create a source tarball corresponding to the latest changes
  - Trigger bintar builds
- Step 3: Bintar builds
  - Fetch the source tarball previously created
  - Compile
  - Test (mysql-test-run)
  - Save bintar
  - Trigger package creation builds
  - Trigger ecosystem builds
- Step 4.1: Package creation
  - Fetch source
  - Create packages
  - Save packages
  - Trigger installation builds
- Step 4.2: Ecosystem tests
- Step 5: Installation builds
  - Fetch packages
  - Test if they install successfully
  - Trigger upgrade builds

- Step 6: Upgrade builds
  - Test if the previously MariaDB Server version can be successfully upgraded to the current one

The information below refers to the old Buildbot (), and not the new Buildbot (). The information is old, outdated, or otherwise currently incorrect.

Overview

The current state of the MariaDB trees with respect to build or test failures is always available from the Buildbot setup page.

- MariaDB-5.5 waterfall status page.
- MariaDB-10.0 waterfall status page.
- MariaDB-10.1 waterfall status page.

The BuildBot setup polls the Launchpad trees every 5 minutes for changes. Whenever a new push is found in one of our trees, the new code is compiled and run through the test suite.

If all platforms are green after this, everything is good. If not, it means there is a problem with the push, and someone needs to look into it ASAP. If it was your push, then the someone who needs to look at it is you!

BuildBot is a generic, GPL'ed program providing a continuous integration test framework. For more information on BuildBot, see the the BuildBot project homepage.

Volunteering to Run a Build Slave

Many of our build hosts are run by community members, and we are always looking for additional volunteers to help us cover additional platforms or build options in BuildBot.

If you are able to provide a spare machine for this purpose, your help is greatly appreciated! This is a good way to get involved without having to spend a lot of time on it. Get started by writing an email to 'developers (at) lists.mariadb.org' with an offer to run a BuildBot slave.

Setting up the Slave BuildBot

See buildbot-setup.

Pausing mysql-test-run.pl

Sometimes you need to work when your computer is busy running tests for buildbot. We've added a new feature to the mysql-test-run.pl script which allows you to stop it temporarily so you can use your computer and then restart the tests when you're ready.

To do this, define the environment variable "MTR_STOP_FILE". Whenever the file specified by this environment variable exists, the mysql-test-run.pl script will stop as soon as it is able to do so (i.e. it won't stop immediately). When the file is removed, the mysql-test-run.pl script will continue from where it left off.

If you plan on using this feature you should also set the "MTR_STOP_KEEP_ALIVE" environment variable with a value of 120. This will make the script print messages to buildbot every 2 minutes which will prevent a timeout.

Database with Test Results

Buildbot saves the results of test runs in a database, to be used for enhanced reporting on web pages without need to change the Buildbot code, and for data mining when investigating test failures.

The database schema is documented under Buildbot Database Schema.
The schema is likely to evolve as we gradually add more kinds of information.

For now, the data is not externally available. But the plan is to set up a slave database to replicate the data, and provide access (eg.
remote database accounts) to members of the community with interesting ideas about how to present or mine this data, or who are just curious to play with it. If anyone has an interest in this, or wants to volunteer a slave host for this purpose, please send a developers@lists.mariadb.org.
The more people show interest in this, the faster it is likely to happen!

Reports

We are developing new reports fed off the test results in the database. These reports will be located here. The first report is the Cross Reference report. This report allows all test failures to be searched.

Buildbot Maintenance

Here is some information on how our Buildbot installation is set up and maintained:

- The configuration file is included in the Tools for MariaDB repository.
- The building and testing of binary packages is documented on the package-testing-with-buildbot-and-kvm page.
- We developed a small tool, runvm, which is used to do some of the builds inside a virtual machine, mostly to test builds of binary packages.
- The BuildBot Development page describes how we developed some of the enhancements to BuildBot that we use and have contributed upstream.

Branch Protection Using Buildbot

MariaDB uses branch protection to ensure that pushes to the MariaDB Server git repository cannot be made without first passing a series of tests. This page aims to describe what a developer should do in order to ensure that their changes get pushed to the main repository.

The current protected branches are the main branches **10.X**/**11.X** and release branches **bb-10.X-release**/**bb-11.X-release***

Protected Branches Flow

1. Rebase your work on top of the latest main branch. `git rebase 10.11`
2. Push to bb-* branch
3. Wait for all the checks to run
4. If all checks are successful you can push to the main branch to be the same as bb-* branch
5. If not (failed checks), check the build status, make changes accordingly and repeat this flow

Protected Branches Builders

The following are the **only** required builders at this point:

1. amd64-debian-11-debug-ps-embedded
2. amd64-debian-12
3. amd64-debian-12-debug-embedded

4. amd64-debian-11-msan
5. amd64-fedora-40
6. amd64-last-N-failed
7. amd64-ubuntu-2004-clang
8. amd64-ubuntu-2004-debug
9. amd64-ubuntu-2204-debug-ps
10. amd64-windows (?)

The protected branches builders run a subset of tests in order to avoid sporadic failures. The list is defined by:

```
--
suite=main,spider,spider/bg,spider/bugfix,spider/feature,spider/regression/e1121,spider/regression/e11212
2 --skip-
test="^stack_crash$|^float$|^derived_split_innodb$|^mysql_client_test$|^kill$|^processlist_not_embedded$|
^sp-big$
```

From github protected_branches_mtr_additional_args.

All other checks are not required in order to make the push. However, please take a look at all the builders and look for failures.

Disabled Protected Branches

Viewing Build Status

The build status can be seen directly from GitHub near the commit message. Below, you can find an example (please note the **yellow dot** near the commit message):

If you click on the **yellow dot**, you can find the list of checks performed and their status, as shown below:

By clicking on **Details** you will be redirected to the buildbot page showing all the build details.

Alternatively, you can look for the builds on the buildbot Grid View. This allows filtering by branch, so to only see changes for one particular branch you can use grid?branch=10.5.

Status and Action Items

- Yellow dot - specifies that one or more of checks are not yet completed.
  - Action item: Wait for all the checks to finish
- Green tick - all checks were successful
  - Action item: No specific action is needed. The push can go through!
- Red X - one or more checks have failed
  - Action item: Look at the status of failing builds and fix potential issues

Note: Only buildbot and not external CI tests (Travis, AppVeyor, etc) are currently in the protected branches criteria. Please take note of other failures, and if they are acceptable and explainable, then merge.

Re-trigger Checks

In some cases it might be useful to re-trigger one or more checks. This can easily be done from the buildbot.mariadb.org interface. The steps are:

1. Login to buildbot.mariadb.org using the GitHub credentials: Hit the “Anonymous” button from the upper right corner and then “Login with GitHub” as shown below:

-

1. Open the build details of the build you want to re-trigger

2. Hit the “Rebuild” button from the upper right corner

Note: If you want to re-trigger all checks, the easiest approach is to make a new push. Alternatively, you can follow the above steps for all the checks

This page is licensed: CC BY-SA / Gnu FDL

Buildbot Database Schema

This page describes the database schema used by Buildbot to save results from test runs.

The idea is to be able to use this data from outside of Buildbot for things like additional web pages presenting test results, or search/data mining facilities for searching for test failures.

Accessing the database

The plan is to make remote database connections available to community members. For this, we need to set up a slave host replicating the master Buildbot database (which would in any case be good to isolate the running Buildbot from possibly high load from queries).

However, for now the database access is only available locally on the machine (hasky) running the buildbot master.

Schema

The most current information about the schema used is available in the file `buildbot/process/mtrlogobserver.py` in the Buildbot sources. As the code evolves and more kinds of information is made available in the database, the schema might be extended, but the schema description in the source code should always be up-to-date.

The `test_run` table

This table has one row for every test run that Buildbot does. Thus, each row corresponds to one cell in the [waterfall Waterfall display]. The format of the table is as follows:

```
CREATE TABLE test_run(
    id INT PRIMARY KEY AUTO_INCREMENT,
    branch VARCHAR(100),
    revision VARCHAR(32) NOT NULL,
    platform VARCHAR(100) NOT NULL,
    dt TIMESTAMP NOT NULL,
    bbnum INT NOT NULL,
    typ VARCHAR(32) NOT NULL,
    info VARCHAR(255),
    KEY (branch, revision),
    KEY (dt),
    KEY (platform, bbnum)
) ENGINE=innodb
```

- id: Primary key, just an auto_increment id.
- branch: This is the name of the bzr branch of the test run.
- revision: The Bzr revision number tested.
- platform: The name of the builder that ran the test.
- dt: Date when the buildbot run was started.
- bbnum: The Buildbot ‘”build number”’ which together with `platform` uniquely identifies a build within Buildbot.
- typ: Concise abbreviation describing the kind of test. For example `pr` for –ps-protocol with row based replication, or `nm` for normal run with mixed-mode replication.
- info: Short textual description of the kind of test run.

The `test_failure` table

This table has one row for every test failure encountered:

```
CREATE TABLE test_failure(
    test_run_id INT NOT NULL,
    test_name VARCHAR(100) NOT NULL,
    test_variant VARCHAR(16) NOT NULL,
    info_text VARCHAR(255),
    failure_text TEXT,
    PRIMARY KEY (test_run_id, test_name, test_variant)
) ENGINE=innodb
```

- test_run_id: This identifies the test run in which the test failure occurred (eg. it is a foreign key to `id` in table `test_run`).
- test_name: The name of the test that failed, eg. `main.information_schema`.
- test_variant: Some tests are run multiple times in different variants. Ie. many replication tests are run under both statement-based, mixed-mode, and row-based replication. The variant will be ‘stmt’, ‘mix’, or ‘row’ accordingly. For tests that do not have multiple variants, the value will be the empty string (ie. not a NULL value).
- info_text: This is a short description that mysql-test-run.pl sometimes gives for some kinds of test failures (for example “timeout”).
- failure_text: This is the entire output from mysql-test-run.pl concerning this test failure. It usually contains the diff against the result file, a stacktrace for a crash, etc. This is useful to run `LIKE` queries against when searching for test failures similar to one being investigated.

The `test_warnings` table

This table holds information about test problems that were detected after a test case ran, during server restart (typically by finding an error or warning message in the server error log files). A typical example of this is a memory leak or a crash during server shutdown.

Such a failure can not be attributed to a specific test case, as it could be caused by any of the tests run against the server since last restart, or could even be a general problem not caused by any test case. Instead, for each occurrence, this table provides a list of names of the tests that were run by the server prior to detecting the error or warning.

```
CREATE TABLE test_warnings(
    test_run_id INT NOT NULL,
    list_id INT NOT NULL,
    list_idx INT NOT NULL,
    test_name VARCHAR(100) NOT NULL,
    PRIMARY KEY (test_run_id, list_id, list_idx)
) ENGINE=innodb
```

- test_run_id: Identifies the corresponding row in table `test_run`.
- list_id: This is a counter for occurrences of warnings within each test run (ie. it starts over from 0 again for each different value of `test_run_id`).
- list_idx: This is a counter for each test name (ie. it starts over from 0 again for each different value of `test_run_id` ‘’and’’ `list_id`).
- test_name: The name of the test run by the server prior to seeing the warning.

Sample queries

Show all platforms that failed for a particular revision of a particular branch:

```
SELECT platform
  FROM test_run r
WHERE branch = 'mysql-6.0-testing2'
  AND revision = '2819'
  AND (EXISTS (SELECT * FROM test_failure f WHERE f.test_run_id = r.id)
    OR EXISTS (SELECT * FROM test_warnings w WHERE w.test_run_id = r.id));
```

Find failures similar to a given failure being investigated:

```
SELECT branch, revision, platform, test_name, test_variant, failure_text
  FROM  test_failure f
  INNER JOIN test_run r ON (f.test_run_id = r.id)
  WHERE failure_text LIKE "%--protocol=TCP' failed%";
```

Check which branches a specific kind of failure has occurred in:

```
SELECT branch, COUNT(*)
  FROM test_failure f
  INNER JOIN test_run r ON (f.test_run_id = r.id)
  WHERE failure_text LIKE "%--protocol=TCP' failed%"
  GROUP BY branch;
```

Find all test runs where a given test was run against a server that later had warnings in the error log, and also count the number of occurrences of this event in each run:

```
SELECT branch, revision, platform, COUNT(*)
  FROM test_warnings w
  INNER JOIN test_run r ON (w.test_run_id = r.id)
  WHERE test_name = 'rpl.rpl_plugin_load'
  GROUP BY r.id;
```

Buildbot ToDo

High-priority, High-ROI items

- Ability on the web pages to mark certain builds of high priority, so they will be processed before others as build slaves become available. It must be possible to mark pending builds so not only individually, but also by branch, as well as by (branch,revision). The feature should probably interact in a meaningful way with the existing “nextBuild” ability to prioritise builds (see “Prioritizing Builds” in the Buildbot documentation). Eg.
  it could set appropriate properties somewhere that would be available to the nextBuild function.
- We need a way to kill all running builds, and remove all pending builds, for a given combination of branch and revision. It is possible to manually cancel a pending or running build, but this becomes extremely inconvenient when there are many builders.
  - Comments from buildbot mailing list: “There is already a button (hidden on the change page) for stopping all builds associated to a change.
    Unfortunately, the only way to get to this page seems to be through the waterfall.” “Note that currently, the button on the change page only cancels still-pending builds, it does not stop builds in progress.”
- Fix problem when pushing multiple bzr revisions at one time:

    - Buildbot should wait a few moments before starting a build, and then start building the latest (currently it seems to build the first revision immediately, and even often seems to not build the latest revision at all, getting confused about the order)
    - When pushing a change that changes revision numbers, the grid display can get really confused, would be nice to fix this somehow.
- Any failure other than compile/test failure should mean a re-run. Failures like buildslave reboot or loss of connection or timeout of bazaar operation should be interpreted as if the build has never happened, and the system should re-try building.
- In the bzr source step, retry the checkout a couple of times if it fails (to be more robust against temporary Launchpad problems, which we see a number of). Could maybe be done as a general Buildbot optional feature for all revision control systems supported, or maybe specific for the bzr depending on what can work.
- Get PBXT test suite fixed in `--valgrind`; once that is done include it in the list of main suites so that it is tested on all platforms (and remove the special extra pbxt test steps in some Buildbot builds, as they will no longer be needed).
- Load statistics. We need it to be able to see if adding another tree will starve the buildbot:
    - Percentage of busy time for available slaves
    - Median/Max response time (How much time do I have to wait after I've pushed for test run to complete)
- Fix that mysql-test-run uses `--skip-ssl` by default.
- Fix that `mysql-test-run.pl --mem` doesn't properly clean up `/dev/shm/var*` (so that we can use `--mem` and `--parallel` option to speed up the more powerful machines).
- For triggered builds (ie. one builder makes a source tarball which another builder consumes), make it so that the pushed changesets are also transferred, so the blamelist on the build page works (currently the blame list is empty).
- Upgrade to Buildbot 0.8 on the master. Then use the facility to use a MariaDB server as backend for both speedup (hopefully) and more flexible querying of buildbot history.

Lower priority items

- It should be easier to setup for a new user. Ideally, there should be one tarball that one can download, unpack and run. Within the tarball there should be a script and/or config files which allow to add the buildslave into automatic startup. The following should not be there:
    - Dependence of buildslave on a load of python libraries. Ship them.
    - Same for bzr
    - Same for mysqld itself. Dl/make/make-install everything we need in the buildbot directory.

If the above is not done, we'll never get much participation from old or unusual machines. The owners of such machines do not have the latest libraries, installing them requires some manual effort, which simply sets the bar too high.

- Check archivist observation/bug that build slave `uname` info disappears when slave is disconnected.
- Self refresh at a time interval (ajax maybe to reduce transfer) so users can know when to fire up a slave.
- In the waterfall page, second line from top is "current activity". When displaying a particular branch ("?branch=5.1"), the "current activity" for hosts that are currently building another branch could also display the name of the branch (as a link to waterfall page for that branch) to avoid confusion that it is active on the current branch.
- Run with `--valgrind-mysqld` instead of `--valgrind`. Little point in Valgrinding mysqltest when we in any case ignore any errors in that program.
- Show pending builds for a slave on the 'builders' page, eg. hardy-x86-rtai

- Show dates in local time of the client. One way is with
  Javascript: a client-side script (would be nice if some dates were still shown when javascript is not available).
- Check if InnoDB is fixed sufficiently to have no Valgrind leaks with `innodb_use_sys_malloc`; if so remove hack in `mysql-test-run.pl` to disable this in valgrind case.
- Fix problem that illegal regexp causes build exception (example:the `sol-sparc-32` compile log).
  The problem is that Buildbot grabs regexps from the suppression file in the
  MariaDB tree and tries to compile them; if this throws exception, then the exception should be caught (and possibly warned about), not crash the whole build.

Improve binary package build and test

- Add `apt-get source mariadb-server` checking in buildbot (for package testing).
- Add testing of bintar package with real start of server mysqld_safe and also test on different distro/version than what was built (eg hardy<->jaunty).
- In package build, sign .debs with dummy key, to more accurately test the real build process.
- Switch to build the bintar packages on centos 5, to work with older glibc versions? Or maybe even Debian 4 which is older I think? But do the install test in Buildbot also on other/newer distros (should probably test on several in each build).
- Add a test step for .deb that tests upgrading from an earlier version of
  MariaDB (currently we only check upgrade from MySQL).
- Add a 'follow log' feature to runvm (which does `ssh guest tail -f log > log`). Use this in the Buildbot packaging step that runs mysql-test-run.pl, so that we can get mysqld.X.err.Y server logs available like for the non-kvm builds.
- For runvm: add the options "-o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no" to the ssh command used to login to the guest vm, so we do not get a login failure due to different host keys in different guests.

Staging trees

Idea is to set it up so that each developer/group has a stating tree. Any push to this tree will first get a full round of testing in Buildbot. If all results are green after this, it will automatically be pushed to the main tree. If another push gets in first, it will automatically merge the new stuff and re-try a full Buildbot test. If there is a problem (test failure or merge conflict), it will send mail with details.

- Get something working, simple initially.
- Staging tree per-captain
- `mysqltest --require` not-staging to speed up Valgrind

Package Testing with Buildbot and KVM

Buildbot Testing of Binary MariaDB Packages

This part of the Buildbot setup uses KVM virtual machines to build packages on a wide range of Linux distributions and test the different packages in various ways.

The builds run on a single host, which has an Intel Core i7 860 @ 2.80GHz CPU, 8 GByte of RAM, and a 500GByte disk. The build host is installed with Ubuntu 9.04 Server 64-bit.
The current box is capable of running up to 3 builds in parallel. The entire set of 19 builds take around 3.5 hours to complete.

The build host has no virtual machines that are kept running when idle. Instead each build boots up and shuts down virtual machines on the fly as needed, using the runvm tool.

The details of the setup (installation) of the virtual machines are here.

Builds

(Please check the Buildbot configuration for details, in case this information becomes out of date).

At the time of writing, the builds done are these:

- Source tarball build (on a 32-bit Ubuntu 9.04 VM)
- Binary tarballs, i386 and amd64, on Ubuntu 8.04 VMs.
- Ubuntu, i386 and amd64: 8.04, 8.10, 9.04, 9.10, 10.04 (alpha).
- Debian, i386 and amd64, Debian 4 and Debian 5.
- Centos 5, i386 and amd64.

The builds use the packaging scripts from OurDelta.

In all builds (except for source tarball), the binary package is built, and subsequently attempted installed. The build is done on a virtual machine with compilers and other necessary build tools installed.
The virtual machines are cloned from a reference image before each build (using the –base-image option to runvm). This way, the original images are not modified in any way, so there is no risk of “pollution” from previous builds, and no need to carefully clean up after a build or test.

The source tarball build is done in a virtual machine that is not reset after every build. This is to preserve the bzr shared repository setup inside the virtual machine. This way it is only necessary in each build to download new changes from Launchpad, which saves significant amounts of time (and Launchpad bandwidth). Since this particular build only works inside the source checkout directory, the risk of cross-build pollution is minimal.

The source tarball build is the only one that is triggered by bzr commits. After it has successfully built a source tarball, the tarball is uploaded to the Buildbot master, and all of the other builders are triggered to start building. Each will download the source tarball from the master and build from that rather than from a bzr checkout (this is the correct way, as we want to ensure that users building from the source tarball themselves get the same results as the packages built by us).

Since we use the OurDelta scripts, which use a “bakery” for the build scripts similar to a source tarball, there is a bakery tarball similarly generated from bzr and uploaded to the master.

Because of this triggering, it is not possible to manually force a Buildbot run on “latest bzr version” on the non-tarball builders. Instead to force a build, it is necessary to set the build properties for source tarball and bakery manually to the files one wants to tests. But it is often easier just to pick an existing build (with correct tarball) and use the “resubmit build” feature instead. Another option is to force build on the tarball build only; it will then in turn trigger all of the other builds.

Basic Install Test

On all builds (except source tarball), after the build a test is performed where the resulting package is installed in a virtual machine and basic testing is done.

The install test is done in a separate virtual machine from the one in which it was built, with no build tools and a very minimal install (to check that we have no hidden dependencies). The install test is currently *very* basic, basically just create a table and insert a row (it would be a nice ToDo to extend this testing to a more complete “smoke test”).

Note that for .deb (Debian and Ubuntu), we set up a small fake local apt repository, so that we can properly test that ‘’apt-get install’’ is able to pull in any extra dependencies without anything special needed on the part of the user.

Upgrade Tests for .deb Packages

On .deb builders (Debian and Ubuntu), we do three additional upgrade tests.

Two of them install the newly built MariaDB packages on top of an already installed MySQL package (the default MySQL package on that particular distro version), as well as on top of an earlier version of the MariaDB packages. For this, separate virtual machine images are used, based on the one used in the install test, but in addition with MySQL/MariaDB pre-installed.

The third test is performed on a clean image without any pre-installed MySQL or MariaDB packages. The test installs the latest available release of the same major version from MariaDB public repo, and then runs dist-upgrade using the local repo as a source of the new packages. The main goal of this test is to check that regular system upgrades performed via dist-upgrade work as expected in regard to MariaDB server.

In all tests, some very basic test data is also created in the installation, so we can test that replacing the old server installation with our new MariaDB package does not nuke the user's existing data! The test is also useful to check that the upgrade runs correctly with respect to dependencies etc, something that is quite complex to get right with the .deb packaging.

Upgrade Tests for .rpm Packages

On .rpm builders (CentOS, Fedora, RHEL, SLES, openSUSE) we have numerous upgrade tests, although only a small portion of them is run for every branch.

All tests upgrade an already existing installation to the new MariaDB packages. The variables are:

- what kind of existing installation is being upgraded: MariaDB server, MariaDB Galera, MySQL, Percona server, or mysql/mariadb installations provided by distributions;
- which command is used for upgrade: it can either be performed via upgrade/update (depending on the package manager), or install, or dist-upgrade;
- which packages are installed and upgraded: it can be a minimal set, server + client (plus whatever dependencies they bring), or a full set of packages.

In some cases, the tests can also set additional command-line options or environment variables for the package manager. It is normally done when the default installation does not work, and the package manager suggests using a different set of parameters.

Each test uses a clean VM image, installs an initial set of packages, and then uses one of the commands to upgrade the installation. It further checks that the server is upgraded, restarted and is reachable.

mysql-test-run.pl Test

On the .deb builders (Debian and Ubuntu), we additionally do a full mysql-test-run.pl test run. This is done using the package *mariadb-test*.

Note that currently, due to Bug #491349, on newer Ubuntus the default apparmor profile prevents running mysql-test-run.pl. Until this is fixed, the tests need to uninstall apparmor before running the test suite.

Buildbot runvm

One type of build we do in BuildBot is to build and test MariaDB binary packages for the platforms we release on. We build and test packages for Debian

(4 and 5), Ubuntu (8.04 to 10.04), Centos 5, and generic Linux; amd64 and i386 architectures. This testing is done with virtual machines run in KVM.

To better control the startup and shutdown of the virtual machines we use a small wrapper around KVM we developed called **runvm**. The purpose of this tool is to make it easy to boot up a virtual machine, run some build commands inside it, and shut it down cleanly.

This wrapper encapsulates the steps needed to boot up a virtual machine, run a series of commands inside it, and shut it down gracefully afterwards. Some special care is taken in the script to ensure that the virtual machine is always shut down after use (gracefully if possible), even in case of various failures or the loss of the parent process or controlling TTY. And if a conflicting virtual machine somehow manages to escape shutdown, runvm automatically attempts to terminate it before starting a new one. This extra robustness is important for fully automated testing as in our Buildbot setup, to ensure that the system can run unattended for longer periods of time.

Essentially, instead of a normal Buildbot session which would do something like this on the slave:

```
./configure && make
```

We instead use *runvm* to do the same inside a virtual machine running as a
KVM guest with the build slave as host:

```
runvm image.qcow2 "./configure" "make"
```

See the **runvm Usage Examples** or **runvm –help** sections below for more detailed examples, but this is the basic idea.

runvm Usage Examples

Usage Example One

Here is an example command you could use to run a build inside a virtual machine using runvm:

```
runvm --port=2222 ubuntu-hardy-i386.qcow2 \
  "= scp -P 2222 mariadb-5.1.41-rc.tar.gz localhost:" \
  "tar zxf mariadb-5.1.41-rc.tar.gz" \
  "cd mariadb-5.1.41-rc && ./configure" \
  "cd mariadb-5.1.41-rc && make"
```

In this example, `ubuntu-hardy-amd64.qcow2` is a KVM image already installed with compilers and set up for password-less ssh access (using public key authentication). Port 2222 on the host side is forwarded to the ssh service (port 22) on the guest side (so by specifying different `--port` options it is easy to run multiple `runvm` invocations in parallel;
in our Buildbot setup we run 3 builds in parallel this way).

Note the use of the `scp` command, prefixed with an equals sign
“`=`” Commands prefixed in this way are run on the host side rather than the guest side; this is a convenient way to copy data in or results out of the virtual machine while the `runvm` session is running.

Using `runvm` in this way we are able to easily and flexibly manage a large number of virtual machines for automated builds with very little overhead and complexity. In fact we have around 70 distinct virtual machines! The only resource they take is a little disk space (around 37 GByte). And the virtual machines images are also simple to set up, requiring only a minimal install; no need to set up networking bridges or IP addresses, or to install a Buildbot client. All the complex logic runs on the host system, which only needs to be installed once.

By keeping the virtual images simple, builds and tests run in a minimal environment, which is useful to detect any missing dependencies or other problems that do not show themselves on normal developer machines with a full

desktop install (we even do install testing on a separate virtual machine from the one used to build, with compilers etc. not installed on the one used to test installation).

Usage Example Two

A further refinement of **example one** (above) is to create a new temporary virtual machine image before each step as a copy of a reference image, run the build, and throw away the temporary image after the build. This avoids any possibility of a previous build influencing a following build in any way (and thus also simplifies the build setup, as we can install stuff freely without any need to do cleanup). It also avoids having to fix a broken image, like needing to manually run `fsck` after a crash or similar issue. We use this technique for most of our binary package builds in Buildbot.

To use this copy-and-discard technique with runvm, the –base-image option is useful:

```
runvm --port=2222 --base-image=ubuntu-hardy-i386.qcow2 tmp.qcow2 \
  "= scp -P 2222 mariadb-5.1.41-rc.tar.gz localhost:" \
  "tar zxf mariadb-5.1.41-rc.tar.gz" \
  "cd mariadb-5.1.41-rc && ./configure" \
  "cd mariadb-5.1.41-rc && make"
```

This will run the build in a temporary copy `tmp.qcow2` of the reference image `ubuntu-hardy-i386.qcow2`, without modifying the reference image in any way. This uses the copy-on-write feature of the qcow2 image format (see `qemu-img(1)`), so it even takes only very little time (fraction of a second) and minimal space (only changed blocks are written to the new image).

Additional Usage Examples

The above two examples show basically how the package testing in our Buildbot setup is done. There are some further details of course, like more options for the build commands and extra care to get logfiles out to debug problems; the full details are available in our Buildbot configuration file.
But the basic principle is just a number of `runvm` commands like the examples above.

Getting runvm

The `runvm` tool is available under GPL on Lauchpad in the project Tools for MariaDB. In the bzr repository it is found as buildbot/runvm. 0If someone finds it useful or has suggestions for improvements, please drop us a line on the maria-developers mailing list.

runvm –help

Since it might be useful, here is the output from **runvm –help** (check the latest version of the tool for up-to-date output):

```
Usage: ./runvm <options> image.qcow2 [command ...]

Boot the given KVM virtual machine image and wait for it to come up.
Run the list of commands one at a time, aborting on receiving an error.
When all commands are run (or one of them failed), shutdown the virtual
machine and exit.

Commands are by default run inside the virtual machine using ssh(1). By
prefixing a command with an equals sign '=', it will instead be run on the
host system (for example to copy files into or out of the virtual machine
using scp(1)).

Some care is taken to ensure that the virtual machine is shutdown
gracefully and not left running even in case the controlling tty is
closed or the parent process killed. If a previous virtual machine is
already running on a conflicting port, an attempt is made to shut it
down first. For this purpose, a PID file is created in $HOME/.runvm/

Available options:

  -p, --port=N        Forward this port on the host side to the ssh port (port
                      22) on the guest side. Must be different for each runvm
                      instance running in parallel to avoid conflicts. The
                      default is 2222.
                      To copy files in/out of the guest use a command prefixed
                      with '=' calling scp(1) with the -P option using the port
                      specified here, like this:
                          runvm img.qcow2 "=scp -P 2222 file.txt localhost:"
  -u, --user=USER     Name of the account to ssh into in the guest. Defaults to
                      the name of the user invoking runvm on the host.
  -m, --memory=N      Amount of memory (in megabytes) to allocate to the guest.
                      Defaults to 2047.
  --smp=N             Number of CPU cores to allocate to the guest.
                      Defaults to 2.
  -c, --cpu=NAME      Type of CPU to emulate for KVM, see qemu(1) for details.
                      For example:
                          --cpu=qemu64      For 64-bit amd64 emulation
                          --cpu=qemu32      For 32-bit x86 emulation
                          --cpu=qemu32,-nx  32-bit and disable "no-execute"
                      The default is qemu32,-nx
  --netdev=NAME       Network device to emulate. The 'virtio' device has good
                      performance but may not have driver support in all
                      operating systems, if so another can be specified.
                      The default is virtio.
  --kvm=OPT           Pass additional option OPT to kvm. Specify multiple times
                      to pass more than one option. For example
                          runvm --kvm=-cdrom --kvm=mycd.iso img.qcow2 ...
  --initial-sleep=SECS
                      Wait this many seconds before starting to poll the guest
                      ssh port for it to be up. Default 15.
  --startup-timeout=SECS
                      Wait at most this many seconds for the guest OS to respond
                      to ssh. If this time is exceeded assume it has failed to
                      boot correctly. Default 300.
  --shutdown-timeout=SECS
                      Wait at most this many seconds for the guest OS to
                      shutdown gracefully after sending a shutdown command. If
                      this time is exceeded, assume the guest has failed to
                      shutdown gracefully and kill it forcibly. Default 120.
  --kvm-retries=N     If the guest fails to come up, retry the boot this many
                      times before giving up. This helps if the virtual machine
                      sometimes crashes during boot. Default 3.
  -l, --logfile=FILE  File to redirect the output from kvm into. This includes
                      any (error) messages from kvm, and also includes anything
                      the guest writes to the kvm emulated serial port (it can
                      be useful to set the guest to send boot loader and kernel
                      messages to the serial console and log them with this
                      option). Default is to not log this output anywhere.
```

```
-b, --base-image=IMG
                    Instead of booting an existing image, create a new
                    copy-on-write image based on IMG. This uses the -b option
                    of qemu-img(1). IMG is not modified in any way. This way,
                    the booted image can be discarded after use, so that each
                    use of IMG is using the same reference image with no risk
                    of "pollution" between different invocations.
                    Note that this DELETES any existing image of the same
                    name as the one specified on the command line to boot! It
                    will be replaced with the image created as a copy of IMG,
                    with any modifications done during the runvm session.
```

Buildbot Setup Notes

General setup instructions are available in the BuildBot manual, specifically in the section on Setting up a build slave.

In addition to installing BuildBot on the slave host, it is also necessary to install all the tools needed to branch MariaDB from Launchpad and compile it. It is a good idea to first manually branch the code from Launchpad and successfully build it, as otherwise a lot of time may be needed fixing things one at a time as new builds are started and fail in one way or the other.

Unfortunately, bzr is memory hungry, so at least 1 Gigabyte of memory is recommended (you may be able to squeeze through with less, but bzr is a real memory hog). A few Gigabytes of disk space are also needed to hold the build directory.

Here are some detailed instructions for various systems:

- Buildbot Setup for Ubuntu-Debian
- Buildbot Setup for MacOSX
- Buildbot Setup for Solaris
- Buildbot Setup for Windows

See the Buildbot TODO for plans and ideas on improving Buildbot.

Buildbot Setup for macOS

Setting up a Buildbot Slave on macOS

Install buildbot-slave using macports or buildbot from fink (if you use old version of `buildbot` / `buildbot-slave`, you should use the `buildbot` command instead of `buildslave-2.6` in the following instructions).

Add user buildbot. Make sure that you do not have a buildbot user and group on your system:

```
# Check for group with id 101
id -g -nr 101

# Check for user with id 101
id -u -nr 101
```

If you do not have the group and user buildbot, then create the group and the user buildbot:

```
# Create group buildbot with group id 101
GROUP="buildbot"
dscl . create /groups/$GROUP
dscl . create /groups/$GROUP name $GROUP
dscl . create /groups/$GROUP passwd "*"
dscl . create /groups/$GROUP gid 101

# Create user buildbot with id 101
BUILDSLAVE_HOME=/var/lib/buildslave
USER=buildbot
mkdir -p $BUILDSLAVE_HOME
dscl . -create /Users/$USER
dscl . -create /Users/$USER RealName "Buildbot slave"
dscl . -create /Users/$USER NFSHomeDirectory $BUILDSLAVE_HOME
dscl . -create /Users/$USER UserShell /bin/bash
dscl . -create /Users/$USER UniqueID 101
dscl . -create /Users/$USER PrimaryGroupID 101
chown 101:101 $BUILDSLAVE_HOME
```

To hide the user use:

```
defaults write /Library/Preferences/com.apple.loginwindow HiddenUsersList -array-add buildbot
```

Prepare the environment:

```
sudo -i -u buildbot
buildslave-2.6 create-slave --usepty=0 maria-slave hasky.askmonty.org:9989 <slavename> <passwd>
bzr init-repo maria-slave/<slavedirectory>
$EDITOR maria-slave/info/admin
$EDITOR maria-slave/info/host
logout
```

Buildbot can be started/stopped manually with these commands (it's a good idea to start and stop it to see if it is set up correctly). If you installed buildbot from fink, please make sure that the buildbot user is using the environment settings. Your .profile should contain following line:

```
sudo - buildbot
more .profile
test -r /sw/bin/init.sh && . /sw/bin/init.sh
```

```
sudo -i -u buildbot
buildslave-2.6 start maria-slave
buildslave-2.6 stop maria-slave
logout
```

In order to make buildbot start on system boot, you'll need to create a `/Library/LaunchDaemons/net.sourceforge.buildbot.plist` file with the following contents (modified example from buildbot wiki):

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE plist PUBLIC "-//Apple//DTD PLIST 1.0//EN" "http://www.apple.com/DTDs/PropertyList-1.0.dtd">
<plist version="1.0">
    <dict>
    <key>StandardOutPath</key>
    <string>twistd.log</string>
    <key>StandardErrorPath</key>
    <string>twistd-err.log</string>
    <key>EnvironmentVariables</key>
    <dict>
        <key>PATH</key>
        <string>/opt/local/bin:/sbin:/usr/sbin:/bin:/usr/bin</string>
        <key>PYTHONPATH</key>
        <string>/opt/local/lib/python2.5/site-packages</string>
    </dict>
    <key>GroupName</key>
    <string>daemon</string>
    <key>KeepAlive</key>
    <dict>
        <key>SuccessfulExit</key>
        <false/>
    </dict>
    <key>Label</key>
    <string>net.sourceforge.buildbot.slave.test</string>
    <key>ProgramArguments</key>
    <array>
        <string>/opt/local/bin/buildslave-2.6</string>
        <string>start</string>
        <string>--nodaemon</string>
        <string>maria-slave</string>
    </array>
    <key>RunAtLoad</key>
    <true/>
    <key>UserName</key>
    <string>buildbot</string>
    <key>WorkingDirectory</key>
    <string>/var/lib/buildslave/</string>
    </dict>
</plist>
```

If you installed buildbot from fink, you can edit and copy the `plist` file:

```
$EDITOR /sw/share/doc/buildbot-py26/contrib/os-x/net.sourceforge.buildbot.slave.plist
```

Your `plist` file should similar to this one after editing:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE plist PUBLIC "-//Apple Computer//DTD PLIST 1.0//EN" "http://www.apple.com/DTDs/PropertyList-
1.0.dtd
">
<plist version="1.0">
<dict>
         <key>Label</key>
         <string>net.sourceforge.buildbot.slave</string>

         <!-- Change this to the user you want to run buildbot as -->
         <key>UserName</key>
         <string>buildbot</string>

         <!-- Change this to your buildbot working directory -->
         <key>WorkingDirectory</key>
         <string>/Volumes/MiniHD2/ServiceData/buildslave/maria-slave</string>

         <key>EnvironmentVariables</key>
         <dict>
                 <key>PATH</key>
                 <string>/sw/bin:/sw/sbin:/usr/bin:/bin:/usr/sbin:/sbin:/usr/local/bin</string>
         </dict>

         <key>ProgramArguments</key>
         <array>
                 <string>/sw/bin/twistd</string>
                 <string>--nodaemon</string>
                 <string>--python=buildbot.tac</string>
                 <string>--logfile=buildbot.log</string>
                 <string>--prefix=slave</string>
         </array>

         <key>KeepAlive</key>
         <dict>
                 <key>SuccessfulExit</key>
                 <false/>
         </dict>

         <key>RunAtLoad</key>
         <true/>

</dict>
</plist>
```

```
sudo cp /sw/share/doc/buildbot-py26/contrib/os-x/net.sourceforge.buildbot.slave.plist
/Library/LaunchDaemons/
```

Warning:

You have to start your build slave via `launchd`, otherwise you will run into several problems. For further details, please refer to Using Launchd.

Buildbot Setup for Windows

This is the recipe for setting up a MariaDB Buildbot slave on Windows:

1. Prepare the development environment
2. Install Python, 32 bit. Twisted does not work on 64 bit and builtbot hasn't been tested properly with Python version 3.
   Note: As of June 2016, there is no fresh Twistd for 32-bit Python, so a 64-bit version has to be installed. Installed 2.7.11 64-bit, it seems to work.

3. Install pywin32. Make sure the version matches your Python version perfectly, and get the .exe file, not the zip file.
   Note: As of June 2016, used `pywin32-220.win-amd64-py2.7.exe`, it seems to work.
4. Install Twisted
   Note: As of June 2016, used `Twisted 16.2.0 for Python 2.7 64 bits`
5. Install buildbot: Get the zip file and unpack it. In an administrator shell, cd to the buildbot dir and run "python setup.py install". After that, the unpacked buildbot directory is no longer needed.
   Note: As of June 2016, used `buildbot 0.8.12`.

When this has been done, you run these commands:

```
cd <somewhere>
mkdir buildbot
cd buildbot
bzr init-repo .
C:\buildbot\buildbot-slave-0.8.3\build\scripts-2.7\buildslave.bat create-slave --usepty=0 <slavedir>
hasky.askmonty.org:9989 <slavename> <passwd>
```

Adjust paths in the last command according to the location of your unpacked buildbot.

You get and from one of the MariaDB Corporation or MariaDB Foundation people handling the buildbot system. can be whatever you want - is a good choice.

Please edit the files \info\admin and \info\host with your information. The host information should include your Windows version, 32 or 64 bit, and your Visual Studio version.

You can test the buildbot slave with this command:

```
C:\buildbot\buildbot-slave-0.8.3\build\scripts-2.7\buildslave.bat start <somewhere>\buildbot\<slavedir>
```

When buildbot starts, you should configure it as a service instead of manually. See the instructions here. It's under the section "Windows Buildbot service setup". This document also has the generic Windows Buildbot installation documentation.

Why Buildbot Should Run as a Service

When buildbot is running in user session, and application that is started by buildbot crashes, you'll get a crash popup. There are popups that are generated by post-mortem debugging and there are popups that are generated by Windows Error reporting. It is hard (or impossible for those who did not try this before) to get rid of all popups. Thus, do run buildbot as service. There are no popups in services.

Common Windows Buildbot Failures

Test hangs after trying to call cdb to print a backtrace.

MTR attempts to call `cdb` via the Perl backticks operator, when mysqld.exe crashes. On the first run, cdb is downloading public Windows symbols from msdl.microsoft.com/download/symbols. The symbols are cached in C:\cdb_symbols, and following runs will be faster, however crashdump analysis on very first crash will typically take some time.

If you find this bothering, start the test with `--mysqld=--gdb` which will cause no crashdump files to be created and thus will prevent `cdb` from being called.

Buildbot exception `The process cannot access the file because it is being used by another process`

This is due to the fact that buildbot does not clean up any processes left over from a previous run, and those processes may hold locks on files that are needed for a new build to start. Current workaround is to use windows job

objects that allow to terminate entire process trees. We use special “process launcher” utility called “`dojob` . This will also require changing buildbot configuration for the builder.

Download dojob.cpp, and compile it with

```
cl dojob.cpp
```

Then, put dojob.exe into a directory in the PATH environment variable.
Then, change buildbot configuration to use “dojob” for every command, as a replacement for “cmd /c”, e.g

```
factory.addStep(Compile(
        name = "cmake",
        command=["dojob", WithProperties("cd c:\\buildbot\\%(buildername)s\\build && cmake .")]
));
```

Buildbot exception `ShellCommand.failed: command failed: SIGKILL failed to kill process`

(Seen very seldom?). This usually happens after retrying multiple failing tests multiple times. It appears that MTR’s `--retries=` option is not safe to use on Windows. The solution is to run the test with no `--retries` .

Buildbot exception `Connection to the other side was lost in a non-clean fashion.`

This is a sympthom of intermittent network issues, which cause Buildbot to abort the current build altogether. The following workarounds are possible:

- In your `buildbot.tac` file, specify a higher `keepalive` value, such as 60000.
  Note: For the current versions (as of June 2016), the opposite solution worked: keepalive = 60. KeepAliveTime in the Windows registry has been set to 60000 as suggested below, but there is no proof it made any difference.
- If you are running the Windows host inside VMWare, substitute the `e1000` network adapter with `vmxnet3`
- If your build host is behind a firewall, makes sure that the firewall does not time out any idle connections quickly. Configure at least a 24-hour timeout.
- If your build host is behind a firewall, consider disabling the built-in Windows Firewall in order to avoid one potential point of failure.
- Modify the Windows `KeepAliveTime` registry setting to a lower value, such as 60000 (equal to 60 seconds). For more information, see TechNet
- Make sure the buildbot master does not experience prolonged bouts of 100% CPU activity, as this may prevent keepalives from working. If the buildbot master `twisted.log` says that data is frequently being loaded from on-disk pickles, increase the `buildCacheSize` in the master configuration file to be more than the number of builds per builder that the log file reports are being loaded.

Alternative Windows Buildbot Setup

> **Note:**
>
> This is an experimental setup.

In case the default Windows buildbot setup is not sufficiently reliable due to “connection lost in a non-clean fashion” errors, the following setup can be used instead. It runs the buildbot daemon on a linux host while doing the builds on Windows, thus working around Twisted issues on Windows.

Note that the procedure below _significantly_ degrades the overall security of your Windows host. It is strongly recommended that a properly-firewalled, standalone virtual machine is used.

- Set the Windows server to auto-login with the user the builds will run as. This will prevent any issues relating to running things as a service and the privilege considerations associated with services;

- Install FreeSSHd on Windows. The OpenSSHd/Cygwin combo is not likely to work.
  - Do not run FreeSSHd it as a service, but rather as a startup console application for the user you are running the builds under. This allows FreeSSHd UI to properly operate;
  - Generate a private/public key pair using PuTTYGen and place the public part in a properly named file in the key directory specified in the FreeSSHd GUI
  - Using the FreeSSHd GUI, create a new user and set it to use key authentication;
  - Set the SFTP home path to the directory where builds will take place.
- Disable UAC (User Access Control) (or set to lowest level) by using the Users Control Panel. Add your buildbot user to the Administrators group.
- Export the private key from PuTTYGen and copy it to a Linux host.
- Install buildbot on the Linux host
- The buildbot configuration file will then look something like:

```
f_win2008r2_i386_release.addStep(ShellCommand(
        command=["ssh", "-i", "/home/buildbot/keys/id_rsa", "buildbot@win2008r2-build", "cmd", "/C",
"whoami"]
));
```

The following buildbot considerations apply under this setup:

- buildbot will not perform a proper cleanup of the build directory on the Windows host before each build (it will only clean up things on the linux side). So, a directory cleanup via rmdir must be placed as an explicit first step in the build sequence;
- Bzr() can not be used to check out BZR trees, as it expects that the bzr checkout command will run locally. Instead, an explicit call to bzr checkout via a SSH command must be used;

This page is licensed: CC BY-SA / Gnu FDL

Buildbot Setup for BSD

Here are the steps I did when installing and configuring a buildbot slave on a PC-BSD 9 box.

Add buildbot user:

```
sudo adduser
  buildbot
  /bin/sh
```

Python was already installed.

Bazaar was already installed.

NTP was already installed.

Install Zope3:

```
cd /usr/ports/www/zope3
sudo make install clean
  # accepted default options
cd /usr/ports/devel/py-zope.interface
sudo make install clean
```

Install Twisted:

```
cd /usr/ports/devel/py-twisted
sudo make install clean
  # accepted default options
```

Install `ccache`:

```
cd /usr/ports/devel/ccache
sudo make install clean
  # accepted default options
```

Run a test compile of MariaDB:

```
cd
cd src/maria/build
BUILD/compile-pentium64-max
  # test compile appeared to work
```

Install buildbot:

```
cd /usr/ports/devel/buildbot
sudo make install clean
  # accepted default options
```

Create the buildbot slave. On the build master, add new entry to `/etc/buildbot/maria-master-private.cfg`:

```
slave-name=bsd9
```

Remember the `${slave-name}` and `${password}` configured above, they're used in the next step.

Back on `bsd9`, do this:

```
sudo su - buildbot
buildslave create-slave --usepty=0 /home/buildbot/maria-slave \
hasky.askmonty.org:9989 ${slave-name} ${password}

echo '${contact-email-address}' > /home/buildbot/maria-slave/info/admin
echo 'A host running PC-BSD 9.' > /home/buildbot/maria-slave/info/host

bzr init-repo maria-slave/bsd9

exit
```

Start the build slave:

```
sudo su - buildbot
buildslave start maria-slave
```

Create the archive directory:

```
sudo su - buildbot
mkdir archive
exit
sudo ln -s /home/buildbot/archive /archive
```

Install Apache:

```
cd /usr/ports/www/apache22
sudo make install clean
  # accepted default options
```

Configure Apache:

```
sudo su -s
echo 'apache22_enable="YES"' >> /etc/rc.conf
echo 'alias /archive "/archive"\
<Directory "/archive">\
  Options All Multiviews\
  AllowOverride All\
  Order allow,deny\
  Allow from all\
</Directory>' >> /usr/local/etc/apache22/httpd.conf

sudo /usr/local/etc/rc.d/apache22 start
```

Install `md5sum`:

```
md5sum already installed at /compat/linux/usr/bin/md5sum
edited /home/buildbot/.profile and added that dir to the path
  # That didn't work, so did the following:
cd /usr/local/bin/
sudo ln -s /compat/linux/usr/bin/md5sum md5sum
```

Buildbot Setup for Solaris Sparc

Setting up a BuildBot slave on Solaris

NOTE #1:_It would probably make sense to create a separate zone for the buildbot on your Solaris 10 system. That is left up to you!_

NOTE #2:_You might need to install the Zope Interface package for some of the Python pieces to work properly. Do this after installing Python 2.5. You can find information on the Zope Interface on their_ *site.*

Solaris 10 (SPARC)

Unless you want to spend time optimizing the underlying Solaris 10 (SPARC) installation, it is strongly suggested that you choose the “Entire” Software
Group during the installation process. Once you have your Solaris 10 (SPARC) system on the network and able to access the Internet you can use the following suggestions to setup your buildbot:

1. By default Solaris 10 comes packages with Python 2.6.x. For compatibility reasons, you need to install Python 2.5.x. The author found it easiest to use Sunfreeware (ftp://ftp.sunfreeware.com/pub/freeware/sparc/5.10/):

```
$ cd /tmp
$ ftp ftp.sunfreeware.com
Name: anonymous
Password: (your email address)
ftp> bin
ftp> cd pub/freeware/sparc/5.10/
ftp> get python-2.5.4-sol10-sparc-local.gz
ftp> quit
$ gunzip python-2.5.4-sol10-sparc-local.gz
$ pkgadd -d python-2.5.4-sol10-sparc-local
```

If you are unfamiliar with howto install packages from Sunfreeware please read their howto.

1. Setup your environment:

- Create a user:

```
$ useradd -d /export/home/buildbot -m buildbot
```

It is imperative that you not use Bash as the buildbot user's shell.
It could have been a dependency issue but I literally spent several days trying to solve why the buildbot wasn't checking out code with bzr only to discover that using the default Solaris shell fixed the problem. If someone comes up with a solution please let us know on the mailing list.

- Adjust the global profile (you could be more granular here but since I'm setting up a dedicated system I wasn't):

```
$ vi /etc/profile
LD_LIBRARY_PATH=/opt/csw/lib:/usr/local/lib:/usr/sfw/lib:$LD_LIBRARY_PATH

# Add required libraries

PYTHONPATH=/usr/local/lib/python2.5/site-packages:$PYTHONPATH

# Makes Python 2.5 the default

PATH=/usr/local/bin:/usr/bin:/usr/sbin:/etc:/usr/sfw/bin:$PATH

# Puts "local" packages in your path

export LOGNAME PATH PYTHONPATH LD_LIBRARY_PATH
```

1. Install the latest Twisted:

```
$ wget tmrc.mit.edu/mirror/twisted/Twisted/9.0/Twisted-9.0.0.tar.bz2
$ bunzip2 Twisted-9.0.0.tar.bz2
$ tar -xf Twisted-9.0.0.tar
$ cd Twisted-9.0.0
$ python setup.py build install
```

1. Install required packages from Sunfreeware:

```
automake, autoconf, gcc, m4, md5, openssl, libsigsegv, Tcl, Tk, perl,
libtool, sed, libgcc, gcc, libintl, libiconv, zlib, binutils, groff, cmake
```

1. Install the Bazaar DVCS:

- You can find a package on Google Code.
- Install the latest Bazaar for Solaris 10. At the time of this writing it was 1.14.1: bzr-1.14.1-sol10-sparc-local.gz .

1. Volunteer your buildbot to the Maria team. Follow the directions listed in the Volunteering to run a build slave section of the About Buildbot page.
2. Create the buildbot as the buildbot user:

```
buildbot create-slave --usepty=0 /export/home/buildbot/maria-slave
hasky.askmonty.org:9989 ${buildbotname} <passwd>
```

Replace ${buildbotname} with the buildbot name you received from the MariaDB developers. Replace with the password they gave you.
You can adjust these and other parameters anytime within the maria-slave/buildbot.tac file at anytime in the future.

1. Create a shared Bazaar repository in the buildbot build directory:

```
HOME=/export/home/buildbot; bzr init-repo maria-slave/${buildbotname}
```

Replace ${buildbotname} like you did in Step #7.

1. Attach the buildbot to the master (this assumes you are not logged in as buildbot):

```
sudo su - buildbot -c "/usr/bin/buildbot start /export/home/buildbot/maria-slave"
```

OPTIONAL: You can create a proper service by following (and modifying as necessary) these directions

1. Please ask on the #maria IRC channel on irc.freenode.net if you have problems or questions setting up your buildbot. Or ask on the on the maria-developers mailing list.
2. Check the status of your buildbot through the BuildBot buildslaves page.

This howto was contributed by Adam Dutko. The original version is here.

Buildbot Setup for Solaris x86

The following steps were used to create a Solaris 10 x86 BuildSlave.

I started with a default install of Solaris 10.

First I added a new user with:

```
groupadd sudo
useradd -d /export/home/${username} -m -s /bin/bash -g staff -G sudo ${username}
passwd ${username}
```

I then logged in as the new user and setup an ssh key.

Now to install software

Prior to actually installing the software, I adjusted the global profile so that the /usr/local/ dirs were included in the various PATHs:

```
vi /etc/profile

# Add the following lines:

LD_LIBRARY_PATH=/opt/csw/lib:/usr/local/lib:/usr/sfw/lib:$LD_LIBRARY_PATH # Add required libraries
PYTHONPATH=/usr/local/lib/python2.5/site-packages:$PYTHONPATH
PATH=/usr/local/bin:/usr/bin:/usr/sbin:/etc:/usr/sfw/bin:$PATH # Puts "local" packages in your path
export LOGNAME PATH PYTHONPATH LD_LIBRARY_PATH
```

The extra software, I downloaded from sunfreeware:

```
cd /tmp
ftp ftp.sunfreeware.com
anonymous
none

bin
cd pub/freeware/intel/10/
mget python-2.5.1-sol10-x86-local.gz sudo-1.7.4p4-sol10-x86-local.gz libintl-3.4.0-sol10-x86-local.gz
libgcc-3.4.6-sol10-x86-local.gz libiconv-1.13.1-sol10-x86-local.gz

mget automake-1.9-sol10-intel-local.gz autogen-5.9.8-sol10-x86-local.gz autoconf-2.68-sol10-x86-local.gz
gcc-4.5.1-sol10-x86-local.gz

mget m4-1.4.15-sol10-x86-local.gz libtool-2.4-sol10-x86-local.gz gmp-4.2.1-sol10-x86-local.gz

mget md5-6142000-sol10-intel-local.gz openssl-1.0.0c-sol10-x86-local.gz libsigsegv-2.9-sol10-x86-local.gz
tcl-8.5.9-sol10-x86-local.gz tk-8.5.9-sol10-x86-local.gz perl-5.12.2-sol10-x86-local.gz

mget libtool-2.4-sol10-x86-local.gz sed-4.2.1-sol10-x86-local.gz zlib-1.2.5-sol10-x86-local.gz binutils-
2.21-sol10-x86-local.gz groff-1.21-sol10-x86-local.gz bzip2-1.0.6-sol10-x86-local.gz

mget make-3.82-sol10-x86-local.gz sed-4.2.1-sol10-x86-local.gz gdb-6.8-sol10-x86-local.gz coreutils-8.9-
sol10-x86-local.gz cmake-2.6.0-sol10-x86-local.gz

quit
```

With all of the software downloaded, I next setup and configured sudo and python:

```
su
gunzip -v python-2.5.1-sol10-x86-local.gz
pkgadd -d python-2.5.1-sol10-x86-local

gunzip -v libintl-3.4.0-sol10-x86-local.gz libgcc-3.4.6-sol10-x86-local.gz libiconv-1.13.1-sol10-x86-
local.gz sudo-1.7.4p4-sol10-x86-local.gz

pkgadd -d libintl-3.4.0-sol10-x86-local
pkgadd -d libgcc-3.4.6-sol10-x86-local
pkgadd -d libiconv-1.13.1-sol10-x86-local
pkgadd -d sudo-1.7.4p4-sol10-x86-local

mkdir -p /usr/local/var/lib/
/usr/local/sbin/visudo
```

With sudo now working, I logged out and then back in. I then installed the other packages:

```
cd /tmp

gunzip -v *.gz

sudo pkgadd -d autoconf-2.68-sol10-x86-local
sudo pkgadd -d autogen-5.9.8-sol10-x86-local
sudo pkgadd -d automake-1.9-sol10-intel-local
sudo pkgadd -d binutils-2.21-sol10-x86-local
sudo pkgadd -d gcc-4.5.1-sol10-x86-local
sudo pkgadd -d groff-1.21-sol10-x86-local
sudo pkgadd -d libsigsegv-2.9-sol10-x86-local
sudo pkgadd -d make-3.82-sol10-x86-local
sudo pkgadd -d m4-1.4.15-sol10-x86-local
sudo pkgadd -d md5-6142000-sol10-intel-local
sudo pkgadd -d openssl-1.0.0c-sol10-x86-local
sudo pkgadd -d perl-5.12.2-sol10-x86-local
sudo pkgadd -d tcl-8.5.9-sol10-x86-local
sudo pkgadd -d tk-8.5.9-sol10-x86-local
sudo pkgadd -d zlib-1.2.5-sol10-x86-local
sudo pkgadd -d bzip2-1.0.6-sol10-x86-local
sudo pkgadd -d libtool-2.4-sol10-x86-local
sudo pkgadd -d sed-4.2.1-sol10-x86-local
sudo pkgadd -d gdb-6.8-sol10-x86-local
sudo pkgadd -d coreutils-8.9-sol10-x86-local
sudo pkgadd -d gmp-4.2.1-sol10-x86-local
sudo pkgadd -d cmake-2.6.0-sol10-x86-local
```

With those packages installed it was time to install the pieces of software which don't have pre-built packages:

Install Zope Interface:

```
cd /tmp
wget http://www.zope.org/Products/ZopeInterface/3.3.0/zope.interface-3.3.0.tar.gz
gunzip -v zope.interface-3.3.0.tar.gz
gtar -xf zope.interface-3.3.0.tar
cd zope.interface-3.3.0/
python setup.py build
sudo python setup.py install
```

Install the latest Twisted framework:

```
cd /tmp
wget http://tmrc.mit.edu/mirror/twisted/Twisted/10.2/Twisted-10.2.0.tar.bz2
bunzip2 Twisted-10.2.0.tar.bz2
gtar -xf Twisted-10.2.0.tar
cd Twisted-10.2.0
sudo python setup.py install
```

Install Bazaar:

```
cd /tmp
wget http://launchpad.net/bzr/2.2/2.2.2/+download/bzr-2.2.2.tar.gz
gunzip -v bzr-2.2.2.tar.gz
gtar -xf bzr-2.2.2.tar
cd bzr-2.2.2
sudo python setup.py install
```

Install ccache:

```
cd /tmp
wget http://samba.org/ftp/ccache/ccache-3.1.4.tar.gz
gunzip ccache-3.1.4.tar.gz
gtar xvf ccache-3.1.4.tar
cd ccache-3.1.4
./configure --prefix /usr
make
sudo make install
```

Configure and start NTP:

```
sudo cp /etc/inet/ntp.server /etc/inet/ntp.conf
sudo vi /etc/inet/ntp.conf

#
# Comment out the following lines:
#server 127.127.XType.0
#fudge 127.127.XType.0 stratum 0
#broadcast 224.0.1.1 ttl 4
#
# Add in the following lines:

server 0.us.pool.ntp.org
server 1.us.pool.ntp.org
server 2.us.pool.ntp.org
server 3.us.pool.ntp.org

# save the file and quit back the command prompt

sudo touch /var/ntp/ntp.drift
sudo ntpdate 0.us.pool.ntp.org
sudo svcadm enable svc:/network/ntp
```

Check out and make a test build of MariaDB:

```
cd
mkdir src
cd src/
bzr branch lp:maria trunk
cd trunk/
BUILD/compile-solaris-amd64
```

Add a user for buildbot:

```
sudo useradd -d /export/home/buildbot -m buildbot
```

Install Buildbot:

```
cd /tmp
wget http://buildbot.googlecode.com/files/buildbot-slave-0.8.3.tar.gz
gunzip -v buildbot-slave-0.8.3.tar.gz
gtar -xf buildbot-slave-0.8.3.tar
cd buildbot-slave-0.8.3/
sudo python setup.py install
```

Create the buildbot as the buildbot user:

On the build master, add new entry to /etc/buildbot/maria-master-private.cfg

Remember the ${slave-name} and ${password} configured above, they’re used in the next step.

Back on the solaris machine:

```
sudo su - buildbot
buildslave create-slave --usepty=0 /export/home/buildbot/maria-slave \
hasky.askmonty.org:9989 ${slavename} ${password}

echo '${contact-email-address}' > /export/home/buildbot/maria-slave/info/admin
echo 'A host running Solaris 10 x86.' > /export/home/buildbot/maria-slave/info/host

exit
```

Now start the slave:

```
sudo su - buildbot
buildslave start maria-slave
```

That's the basic process.

Buildbot Setup for Ubuntu-Debian

Setting up a Buildbot Slave on Ubuntu and Debian

One great way to contribute to MariaDB development is to run a buildbot builder. These builders are used for running automated builds and tests of MariaDB. The instructions on this page should help you get a builder set up on Ubuntu and Debian.

Setting up the MariaDB Build Environment

For Ubuntu and Debian, a quick way to install much of what you need is:

```
sudo apt-get build-dep mariadb-server
```

If you're running a version of Debian or Ubuntu that doesn't have MariaDB, then do the following:

```
sudo apt-get build-dep mysql-server
```

After running one (or both) of the above, run the following to catch things that they may have missed:

```
sudo apt-get install devscripts fakeroot doxygen texlive-latex-base ghostscript libevent-dev libssl-dev
zlib1g-dev libpam0g-dev libreadline-gplv2-dev autoconf automake automake1.11 dpatch ghostscript-x
libfontenc1 libjpeg62 libltdl-dev libltdl7 libmail-sendmail-perl libxfont1 lmodern texlive-latex-base-doc
ttf-dejavu ttf-dejavu-extra libaio-dev xfonts-encodings xfonts-utils libxml2-dev unixodbc-dev bzr scons
check libboost-all-dev openssl epm libjudy-dev libjemalloc-dev libcrack2-dev git libkrb5-dev libcurl4-
openssl-dev thrift-compiler libsystemd-dev dh-systemd libssl1.0.2 openjdk-8-jdk uuid-dev libnuma-dev gdb
libarchive-dev libasio-dev dh-exec
```

After setting up the build environment do a test build to confirm that things are working. First get the source code using the **git** instructions on the Getting the MariaDB Source Code page, then follow the steps on the Generic Build Instructions page for building MariaDB using **cmake**. If your build succeeds, you're ready to move on to the next step of installing and configuring buildbot.

Do not hesitate to ask for help on the maria-developers mailing list or on IRC.

Buildbot Installation and Setup

Using APT

The easiest way to install buildbot on Ubuntu and Debian is to install the buildbot-slave package, like so:

```
sudo apt-get install buildbot-slave
```

Using Pip

Another way to install buildbot is using the Python **pip** package manager. Pip can be installed with:

```
sudo apt-get install python-pip
```

Next install twisted and the buildbot-slave package using pip:

```
sudo pip install twisted==11.0.0
sudo pip install buildbot-slave==0.8.9
```

Creating the Buildbot Builder

After the buildbot-slave package is installed (either via apt or pip), you need to create the builder using the `buildslave create-slave` command. As part of this command you will need to specify a name for your buildslave and a password. Both need to be given to the MariaDB Buildbot maintainers so that they can add your builder to the build pool. Ask on the maria-developers mailing list or on IRC for who these people are.

An example command for creating the slave is:

```
sudo buildslave create-slave /var/lib/buildbot/slaves/maria buildbot.askmonty.org slavename password
```

If you installed buildbot using pip, the convention is to create a buildbot user and then, as that user, create the buildslave in the home directory like so:

```
sudo buildslave create-slave ~/maria-slave buildbot.askmonty.org slavename password
```

Put some appropriate info in info/admin and info/host files that are created, this will display on the information screen about your builder. See here for example: bb01

Submit your builder information to the MariaDB Buildbot admins. Also let them know if your machine can run multiple builds at the same time (and how many). After adding your builder's information to the main buildbot configuration, all that's left is for you to do is to start your builder.

Starting and Stopping the Builder

If you installed your builder using apt, then you can start and stop it with:

```
sudo /etc/init.d/buildslave start
sudo /etc/init.d/buildslave stop
```

If you installed your build slave using pip, then do the following as the buildbot user in their home directory:

```
buildslave start maria-slave
buildslave stop maria-slave
```

Buildbot Setup for VM Host

This page documents the general setup process for a server that is acting as virtual machine host, like those documented in the Buildbot Setup for Virtual Machines section.

Provision hardware with the most recent Ubuntu LTS release. Add host to DNS. Apply updates (replace `<host>` with hostname):

```
ssh <host>.mariadb.net
sudo apt-get update
sudo apt-get dist-upgrade
```

Install some favorite packages (these aren't necessarily required, but I like them)

```
sudo apt-get install tree renameutils vim-nox
```

A buildbot admin needs to add the new host to the allowed list of rsync clients on the VM master (whichever host is the official host of VM files) The VM master changes periodically, so check to make sure you have the correct one:

```
vi /etc/rsyncd.conf
```

Make a `/kvm/` dir and rsync it with the VM master above. The dir often resides at `/home/kvm/` (or wherever the storage drive is) and is then linked to `/kvm/`. The VMs rely on the `/kvm/vms/` path, so the `/kvm/` location is required:

```
vm_master="hostname"      # ask for this from a buildbot admin
mkdir /home/kvm
ln -sv /home/kvm /kvm
rsync --dry-run --delete --exclude=deprecated \\
  --exclude=iso --exclude=lost+found -avPL ${vm_master}::kvm/ /home/kvm/
# assuming the dry-run looks good, start the "real" rsync in a screen session
screen
rsync --delete --exclude=deprecated --exclude=iso --exclude=lost+found -avPL ${vm_master}::kvm/
/home/kvm/
```

Detach from screen session with `Ctrl+a d`. Configure vim.basic as the default editor (optional):

```
update-alternatives --config editor
```

Install buildbot-slave, bzr, and kvm

```
sudo apt-get install bzr git buildbot-slave qemu kvm
sudo apt-get install libsdl2-2.0-0
```

Add a default user, and then add the user to the appropriate groups:

```
username="mydefaultusername"
sudo adduser ${username}
for group in sudo tty kvm;do
  sudo adduser ${username} ${group}
done
```

Log out, then back in as the default user and change the password. Set up the `/.ssh/authorized_keys` file so you can login that way. Create other standard users and set up their ssh keys (optional).

Turn off password login:

> **Important:**
>
> Make sure to have your ssh key setup before doing this, and disallow all root logins and password logins (it is safer to only allow logins using ssh keys with regular users).

```
sudo perl -i -pe "s/#PasswordAuthentication yes/PasswordAuthentication no/" /etc/ssh/sshd_config
sudo perl -i -pe "s/PermitRootLogin yes/PermitRootLogin no/" /etc/ssh/sshd_config
sudo /etc/init.d/ssh restart
```

Check out `mariadb-tools`:

```
mkdir ~/src
cd ~/src/
bzr branch lp:mariadb-tools
```

Put `runvm` in the right place:

```
sudo cp -v ~/src/mariadb-tools/buildbot/runvm /usr/local/bin/
ls -l /usr/local/bin/
```

Add the buildbot user to the `kvm` and `tty` groups:

```
sudo adduser buildbot kvm
sudo adduser buildbot tty
```

A buildbot admin needs to add this builder to the `maria-master-private.cfg` file on the `${buildmaster}` and also add it to the `c['slaves']` array in `maria-master.cfg` then create the buildslave using the hostname and whatever `${password}` was agreed upon by you and the buildbot admin:

```
sudo buildslave create-slave /var/lib/buildbot/slaves/maria buildbot.askmonty.org ${host} ${password}
```

Add the following to `/etc/default/buildslave` (replace `${hostname}` with the name of the host):

```
HOME=/var/lib/buildbot
SLAVE_ENABLED[1]=1
SLAVE_NAME[1]="${hostname} maria slave"
SLAVE_USER[1]="buildbot"
SLAVE_BASEDIR[1]="$HOME/slaves/maria"
SLAVE_OPTIONS[1]=""
SLAVE_PREFIXCMD[1]=""
```

Edit the admin and host files and add contact information and details on the builder:

```
sudo vi /var/lib/buildbot/slaves/maria/info/*
```

Copy over the buildbot .ssh dir from terrier:

```
scp terrier.askmonty.org:buildbot-ssh.tar.gz .

cd /var/lib/buildbot
sudo tar -zxvf ~/buildbot-ssh.tar.gz
sudo chown -Rv buildbot: .ssh
sudo chmod -v 700 .ssh
sudo chmod -Rv go-r .ssh
```

Edit `/etc/passwd` and change the buildbot user's shell from `/bin/false` to `/bin/bash` , then su to the buildbot user and copy in the `/etc/skel` files:

```
sudo su - buildbot
cp -v /etc/skel/.bash* .
cp -v /etc/skel/.profile .
exit
```

Change ownership of the `buildbot/slaves` dir to `buildbot:buildbot` :

```
sudo chown -Rv buildbot:buildbot ~buildbot/slaves
```

Move the `/var/lib/buildbot` directory to `/home` (or whatever location you want to use to store things) and then link it back:

```
sudo mv -vi /var/lib/buildbot /home/;cd /var/lib/;sudo ln -sv /home/buildbot ./
```

Update `/etc/default/locale` and change it to: `LANG=en_US.UTF-8` :

```
sudo vi /etc/default/locale
sudo locale-gen
```

Monitor the rsync, wait for it to finish. Once the rsync is finished, test the runvm script:

```
sudo su - buildbot
for i in '/kvm/vms/vm-xenial-amd64-serial.qcow2 6666 qemu64' '/kvm/vms/vm-xenial-i386-serial.qcow2 6666
qemu64' ; do \
  set $i; \
  runvm --user=buildbot --logfile=kernel_$2.log --base-image=$1 --port=$2 --cpu=$3 "$(echo $1 | sed -e
's/serial/testtest/')" \
    "sudo DEBIAN_FRONTEND=noninteractive apt-get update" \
    "sudo DEBIAN_FRONTEND=noninteractive apt-get install -y patch libaio1 debconf-utils unixodbc libxml2
libjudydebian1" \
    "= scp -P $2 /kvm/vms/my55.seed /kvm/vms/sources.append buildbot@localhost:/tmp/" \
    "sudo debconf-set-selections /tmp/my55.seed" \
    "sudo sh -c 'cat /tmp/sources.append >> /etc/apt/sources.list'"; \
done
```

Remove the “testtest” VMs we created above

```
rm -v /kvm/vms/*testtest*
```

Start the buildslave:

```
sudo /etc/init.d/buildslave start

tail -f ~buildbot/slaves/maria/twistd.log
```

ssh to `${buildmaster}` and add this new host to `kvm_slaves` in the `maria-master.cfg` file:

```
sudo vi /etc/buildbot/maria-master.cfg
```

Still on `${buildmaster}`, test and then reload buildbot:

```
cd /etc/buildbot
sudo -u buildbot PYTHONPATH=/usr/local/buildbot/lib/python python -c 'exec open("maria-master.cfg", "r")'
sudo /etc/init.d/buildmaster reload
sudo tail -f /var/lib/buildbot/maria/twistd.log
```

Setup of a Buildbot Build Slave

These build instructions should in general be platform agnostic. It is based on a post by Adam M. Dutko on maria-discuss. See the list archive.

To setup a build slave, the basic outline is:

1. Install Python (2.4 or later)
2. Install Twisted (twistedmatrix.com 8.0.x or later) - need Core, Mail, Web and Words (possibly Conch too)
3. Install ZopeInterface (ZopeInterface)
4. Install all the necessary compiler/build components.
5. Install Buildbot
6. Install Git and make sure you can clone from the main project

7. Get a username/login and password from the buildmaster (dbart on Libera.Chat)
8. Verify your buildbot can talk to the buildbot master instance and can run builds.

The following links will also help:

1.
2. buildbot-setup-buildbot-setup-notes
3. about-buildbot

Buildbot Setup for Virtual Machines

This section documents the exact steps used to set up each virtual machine used in the MariaDB Buildbot for building packages and testing. There are lots of boring details, but the information here should be useful for reference, and as a help when installing new virtual images for additional distros and versions.

The articles here document how the virtual machine images were actually set up, not the most efficient way to recreate all of them. Thus, some historical artifacts remain, reflecting the order they were initially added and lessons learned along the way.

For example, the steps for the earliest VMs are somewhat overly enthusiastic about using the `qemu-img create -b` option to make one vm a copy-on-write copy on top of another image. This makes it harder to modify the images afterwards, since if the base image is modified, any copy-on-write vm on top of it needs to be re-created.

The descriptions do not go into painful detail about the installation procedure.
Generally the .iso for the distro was downloaded, and the default, non-graphical installer started. Installing Linux these days is quite easy, and generally just defaults were picked. With respect to harddisk partitioning, generally an 8Gb image was configured, of which 1/2 Gb was reserved for swap and the rest for a single root partition “/”.

For details on setting up a host server to run these VMs, see Buildbot Setup for VM host.

See Buildbot Setup for Virtual Machines - FreeBSD 9.2.

Explains how to provision and configure virtual machine instances specifically for Buildbot testing.

Buildbot Setup for Virtual Machines - FreeBSD 9.2

Base Install

```
qemu-img create -f qcow2 /kvm/vms/vm-freebsd92-amd64-serial.qcow2 15G
qemu-img create -f qcow2 /kvm/vms/vm-freebsd92-i386-serial.qcow2 15G
```

Start each VM booting from the server install iso one at a time and perform the following install steps:

```
kvm -m 2048 -hda /kvm/vms/vm-freebsd92-amd64-serial.qcow2 -cdrom /kvm/iso/freebsd/9.2/FreeBSD-9.2-
RELEASE-amd64-dvd1.iso -boot d -smp 2 -cpu qemu64 -net nic,model=virtio -net
user,hostfwd=tcp:127.0.0.1:2283-:22
kvm -m 2048 -hda /kvm/vms/vm-freebsd92-i386-serial.qcow2 -cdrom /kvm/iso/freebsd/9.2/FreeBSD-9.2-RELEASE-
i386-dvd1.iso -boot d -smp 2 -cpu qemu64 -net nic,model=virtio -net user,hostfwd=tcp:127.0.0.1:2284-:22
```

Once running you can connect to the VNC server from your local host with:

```
vncviewer -via ${remote_host} localhost
```

Replace `${remote_host}` with the host the vm is running on.

> **Note:**
>
> When you activate the install, vncviewer will disconnect after a bit with a complaint about the rect being too large. This is fine. The installer has just resized the vnc screen. Simply reconnect.

Install, picking default options mostly, with the following notes:

- Keymap Selection: Do not set non-default key mapping
- Hostname: to freebsd-92-amd64 or freebsd-92-i386
- Distribution Select: deselect “games”, leave “ports” selected
- Partitioning: Guided and use the entire disk
  - Accept the default partitioning (Finish then Commit)
- Archive Extraction: …wait while installer installs the OS…
- Network Configuration: choose `vtnet0`
  - configure ipv4 w/ DHCP
  - do not configure ipv6
- System Configuration: leave sshd selected, don’t select the others
- Dumpdev Configuration: do not enable crash dumps
- add a buildbot user
  - add user to ‘wheel’ group
- Final Configuration: Apply configuration and exit
- Manual Configuration: yes to opening a shell
  - `echo 'console="comconsole"' >> /boot/loader.conf`
  - Edit /etc/ttys and change off to on and dialup to vt100 for the ttyu0 entry.
  - `shutdown -p now`

Now that the VM is installed, it’s time to configure it.
If you have the memory you can do the following simultaneously:

```
kvm -m 2048 -hda /kvm/vms/vm-freebsd92-amd64-serial.qcow2 -boot c -smp 2 -cpu qemu64 -net
nic,model=virtio -net user,hostfwd=tcp:127.0.0.1:2283-:22 -nographic
kvm -m 2048 -hda /kvm/vms/vm-freebsd92-i386-serial.qcow2 -boot c -smp 2 -cpu qemu64 -net nic,model=virtio
-net user,hostfwd=tcp:127.0.0.1:2284-:22 -nographic

ssh -p 2283 localhost
ssh -p 2284 localhost

su -

cd /usr/ports/security/sudo; make install clean # accept defaults
visudo # uncomment the '# %wheel ALL=(ALL) NOPASSWD: ALL' line
exit

cd /usr/ports/ports-mgmt/portmaster; sudo make install clean # select both autocomplete options

ssh hasky.askmonty.org
exit
sudo su buildbot -
ssh hasky.askmonty.org
exit
exit
exit

scp -P 2283 /kvm/vms/authorized_keys localhost:.ssh/
scp -P 2283 /kvm/vms/authorized_keys buildbot@localhost:.ssh/

scp -P 2284 /kvm/vms/authorized_keys localhost:.ssh/
scp -P 2284 /kvm/vms/authorized_keys buildbot@localhost:.ssh/

ssh -p 2283 localhost
ssh -p 2284 localhost

sudo portsnap fetch extract
sudo portsnap fetch update
sudo portmaster -Da

sudo shutdown -p now
```

VMs for building BSD bintars

```
for i in '/kvm/vms/vm-freebsd92-amd64-serial.qcow2 2283 qemu64' '/kvm/vms/vm-freebsd92-i386-serial.qcow2
2284 qemu64' ; do \
  set $i; \
  runvm --user=buildbot --logfile=kernel_$2.log --base-image=$1 --port=$2 --cpu=$3 "$(echo $1 | sed -e
's/serial/build/')" \
    "cd /usr/ports/devel/libevent;     sudo make install clean BATCH=yes" \
    "cd /usr/ports/devel/boost-all;    sudo make install clean BATCH=yes" \
    "cd /usr/ports/devel/cmake;        sudo make install clean BATCH=yes" \
    "cd /usr/ports/devel/thrift/;      sudo make install clean BATCH=yes" \
    "cd /usr/ports/devel/bzr/;         sudo make install clean BATCH=yes" \
    "cd /usr/ports/devel/bison/;       sudo make install clean BATCH=yes" \
    "cd /usr/ports/databases/unixODBC; sudo make install clean BATCH=yes" \
    "cd /usr/ports/devel/doxygen;      sudo make install clean BATCH=yes"; \
done
```

VMs for install testing.

```
qemu-img create -b /kvm/vms/vm-freebsd92-amd64-serial.qcow2 -f qcow2 /kvm/vms/vm-freebsd92-amd64-
install.qcow2
qemu-img create -b /kvm/vms/vm-freebsd92-i386-serial.qcow2 -f qcow2 /kvm/vms/vm-freebsd92-i386-
install.qcow2

for i in '/kvm/vms/vm-freebsd92-amd64-serial.qcow2 2283 qemu64' '/kvm/vms/vm-freebsd92-i386-serial.qcow2
2284 qemu64' ; do \
  set $i; \
  runvm --user=buildbot --logfile=kernel_$2.log --base-image=$1 --port=$2 --cpu=$3 "$(echo $1 | sed -e
's/serial/install/')" \
    "sudo portsnap cron update"; \
done
```

VMs for MySQL upgrade testing

```
for i in '/kvm/vms/vm-freebsd92-amd64-serial.qcow2 2283 qemu64' '/kvm/vms/vm-freebsd92-i386-serial.qcow2
2284 qemu64' ; do \
  set $i; \
  runvm --user=buildbot --logfile=kernel_$2.log --base-image=$1 --port=$2 --cpu=$3 "$(echo $1 | sed -e
's/serial/upgrade/')" \
    "cd /usr/ports/databases/mysql55-server;    sudo make install clean BATCH=yes" \
    "sudo /usr/local/etc/rc.d/mysql-server onestart" \
    'mysql -uroot -e "create database mytest; use mytest; create table t(a int primary key); insert into
t values (1); select * from t"' ;\
done
```

VMs for MariaDB upgrade testing

```
for i in '/kvm/vms/vm-freebsd92-amd64-serial.qcow2 2283 qemu64' '/kvm/vms/vm-freebsd92-i386-serial.qcow2
2284 qemu64' ; do \
  set $i; \
  runvm --user=buildbot --logfile=kernel_$2.log --base-image=$1 --port=$2 --cpu=$3 "$(echo $1 | sed -e
's/serial/upgrade2/')" \
    "cd /usr/ports/databases/mariadb55-server;    sudo make install clean BATCH=yes" \
    "sudo /usr/local/etc/rc.d/mysql-server onestart" \
    'mysql -uroot -e "create database mytest; use mytest; create table t(a int primary key); insert into
t values (1); select * from t"'; \
done
```

Add Key to known_hosts

Do the following on each kvm host server (terrier, terrier2, i7, etc…) to add the VMs to known_hosts.

```
# freebsd92-amd64
cp -avi /kvm/vms/vm-freebsd92-amd64-install.qcow2 /kvm/vms/vm-freebsd92-amd64-test.qcow2
kvm -m 1024 -hda /kvm/vms/vm-freebsd92-amd64-test.qcow2 -redir tcp:2283::22 -boot c -smp 2 -cpu qemu64 -
net nic,model=virtio -net user -nographic
sudo su - buildbot
ssh -p 2283 buildbot@localhost sudo shutdown -p now
# answer "yes" when prompted
exit # the buildbot user
rm -v /kvm/vms/vm-freebsd92-amd64-test.qcow2

# freebsd92-i386
cp -avi /kvm/vms/vm-freebsd92-i386-install.qcow2 /kvm/vms/vm-freebsd92-i386-test.qcow2
kvm -m 1024 -hda /kvm/vms/vm-freebsd92-i386-test.qcow2 -redir tcp:2284::22 -boot c -smp 2 -cpu qemu64 -
net nic,model=virtio -net user -nographic
sudo su - buildbot
ssh -p 2284 buildbot@localhost sudo shutdown -p now
# answer "yes" when prompted
exit # the buildbot user
rm -v /kvm/vms/vm-freebsd92-i386-test.qcow2
```

Buildbot Setup for Virtual Machines - General Principles

The installations are kept minimal, picking mostly default options. This helps ensure our stuff works on default installs, and also saves effort during the creation of the virtual machines.

Since most of the logic happens in the Buildbot slave on a host machine, and inside the Buildbot master, there is no need to install Buildbot or other similar complex stuff inside the VMs.

ssh

The virtual machines are configured with ssh access. An account called
'buildbot' is created, with passwordless login (using ssh public key authentication), and with passwordless sudo access (needed for automated scripting). The public key for user buildbot is installed in every VM, and the private key is added to the account running the Buildbot master on the host machine.

To generate the ssh keys:

```
ssh-keygen -t dsa
```

Leave the passphrase empty. Run this as the user running the Buildbot slave on the KVM host machine. The resulting /.ssh/id_dsa.pub will be needed below for each virtual machine install.

Serial port

The vms are configured to use the (emulated) serial port as the console. When running KVM on the host, the console then maps to the stdin/stdout. This is useful to get kernel log messages available to easier debug any problems. The bootloader Grub is similarly configured to use the serial port.

The vms are also set up to give a login prompt on the serial port (running getty). In retrospect this has proven not really needed, as if needing to manually log in and investigate things, it is often as easy to just run KVM in graphics mode. It may be useful in cases where the host machine is remote though (in this case graphics mode does still work but can be a bit slow).

To configure for serial console, the following two files are referenced below, and should be prepared in advance:

`ttyS0`

```
# ttyS0 - getty
#
# This service maintains a getty on ttyS0 from the point the system is
# started until it is shut down again.

start on stopped rc2
start on stopped rc3
start on stopped rc4
start on stopped rc5

stop on runlevel 0
stop on runlevel 1
stop on runlevel 6

respawn
exec /sbin/getty 115200 ttyS0
```

`ttyS0.conf`

```
# ttyS0 - getty
#
# This service maintains a getty on ttyS0 from the point the system is
# started until it is shut down again.

start on stopped rc RUNLEVEL=[2345]
stop on runlevel [!2345]

respawn
exec /sbin/getty -L 115200 ttyS0 vt102
```

Unattended MariaDB install on Debian/Ubuntu

my.seed

The MariaDB (and MySQL) package on Debian and Ubuntu prompts the user about the root password to set. We want to test this important step, but we do not want the prompt of course. To do this we use the following configuration file for defaults for debconf. This file is needed in the steps below under the name "my.seed" (be careful to preserve it exactly as here, including trailing space and tab characters!)

```
mariadb-server-5.1  mysql-server/root_password_again    password    rootpass
    mariadb-server-5.1  mysql-server/root_password  password    rootpass
    mariadb-server-5.1  mysql-server/error_setting_password error
    mariadb-server-5.1  mysql-server-5.1/nis_warning    note
    mariadb-server-5.1  mysql-server-5.1/really_downgrade   boolean false
    mariadb-server-5.1  mysql-server-5.1/start_on_boot  boolean true
    mariadb-server-5.1  mysql-server-5.1/postrm_remove_databases    boolean false
    mariadb-server-5.1  mysql-server/password_mismatch  error
    mariadb-server-5.1  mysql-server/no_upgrade_when_using_ndb  error
```

For some background see here.
The file my.seed can be generated from an existing install using debconf-get-selections.

sources.append

For Debian/Ubuntu, we add a local repository to the list of apt source to be able to test `apt-get install`. For this, the following file "sources.append" must be prepared:

```
deb file:///home/buildbot/buildbot/debs binary/
deb-src file:///home/buildbot/buildbot/debs source/
```

Emulation options

The default network card emulated by KVM has poor performance. To solve this we instead use the "virtio" network device, using the KVM options "-net nic,model=virtio -net user". Except on Debian 4, which has an old kernel without support for virtio. Background info here.

A detail is that some 32-bit vms crashed during boot with default options. This was fixed by using the kvm "-cpu qemu32,-nx" option. Some background information here.

Install cmake on Build VMs

Requires cmake. Install cmake on all -build VMs (and other Unix-like machines) with:

```
wget http://www.cmake.org/files/v2.8/cmake-2.8.8.tar.gz
tar -zxvf cmake-2.8.8.tar.gz
cd cmake-2.8.8;./configure
make
sudo make install
```

This page is licensed: CC BY-SA / Gnu FDL

Installing Correct Libraries for PAM and readline

Some additional/alternative libraries needs to be installed to handle readline and PAM correctly.

The newer libreadline is GPLv3 and so not compatible with the MariaDB/MySQL
GPLv2 license. The PAM libraries are needed for the PAM plugin.

On the Centos and RHEL -build VMs, install the pam-devel package:

```
sudo yum install pam-devel
```

On all the Debian/Ubuntu -build virtual machines, install libpam0g-dev:

```
sudo apt-get install libpam0g-dev
```

On debian6/maverick/natty, install libreadline5-dev (replacing any libreadline6-dev already there):

```
sudo apt-get install libreadline5-dev
```

On oneiric (and any newer, eg. Debian 7 or Ubuntu 12.04), the package is called libreadline-gplv2-dev:

```
sudo apt-get install libreadline-gplv2-dev
```

This page is licensed: CC BY-SA / Gnu FDL

Installing the Boost Library Needed for the OQGraph Storage Engine

The OQGraph storage engine needs a newer version of Boost that what is available on (most) distributions. The version installed is 1.42.0, available from.

The boost library is installed in all the builder virtual machine images with the following single command:

```
for i in "vm-hardy-amd64-build qemu64" "vm-hardy-i386-build qemu32,-nx" \
        "vm-intrepid-amd64-build qemu64" "vm-intrepid-i386-build qemu32,-nx" \
        "vm-karmic-amd64-build qemu64" "vm-karmic-i386-build qemu32,-nx" \
        "vm-jaunty-amd64-build qemu64" "vm-jaunty-i386-deb-build qemu32,-nx" \
        "vm-lucid-amd64-build qemu64" "vm-lucid-i386-build qemu32,-nx" \
        "vm-maverick-amd64-build qemu64" "vm-maverick-i386-build qemu32,-nx" \
        "vm-natty-amd64-build qemu64" "vm-natty-i386-build qemu64" \
        "vm-oneiric-amd64-build qemu64" "vm-oneiric-i386-build qemu64" \
        "vm-debian5-amd64-build qemu64" "vm-debian5-i386-build qemu32,-nx" \
        "vm-debian4-amd64-build qemu64 --netdev=e1000" "vm-debian4-i386-build qemu32,-nx --netdev=e1000"
\
        "vm-centos5-i386-build qemu32,-nx" "vm-centos5-amd64-build qemu64" \
        "vm-hardy-amd64-build qemu64" "vm-hardy-i386-build qemu32,-nx" \
        "vm-jaunty-i386-deb-tarbake qemu32,-nx" ; do \
  set $i; \
  runvm -m 512 --smp=1 --port=2200 --user=buildbot --cpu=$2 $3 $1.qcow2 \
    "= scp -P 2200 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no /kvm/boost_1_42_0.tar.gz
buildbot@localhost:/dev/shm/" \
    "sudo mkdir -p /usr/local/src /usr/local/include" \
    "cd /usr/local/src && sudo tar zxf /dev/shm/boost_1_42_0.tar.gz" \
    "cd /usr/local/include && sudo ln -s ../src/boost_1_42_0/boost ." ; \
done
```

Upgrade Boost to 1.49

To upgrade boost on the VMs to 1.49 I performed the following steps:

I initially tried to upgrade the VMs using a script like the one at the top of the page which was used to install boost 1.42, but I ran into issues with getting it to work on all of the VMs (it worked on some, but not on others). So I ended up using the steps below.

1. Copy the VM (keeping the original as a backup, in case something goes wrong):

```
oldvm="vm-debian6-i386-build.qcow2"
newvm="vm-debian6-i386-build.upd.qcow2"
cp -avi ${oldvm} ${newvm}
```

1. Start the VM:

```
kvm -m 1024 -hda /kvm/vms/${newvm} -redir 'tcp:22775::22' -boot c -smp 1 -cpu qemu64 -net
nic,model=virtio -net user -nographic
```

1. Copy the boost tar.gz file over to the VM:

```
scp -i /kvm/vms/ssh-keys/id_dsa -o StrictHostKeyChecking=no -o UserKnownHostsFile=/dev/null -P 22775
/kvm/boost_1_49_0.tar.gz buildbot@localhost:/dev/shm/
```

1. ssh into the VM:

```
ssh -i /kvm/vms/ssh-keys/id_dsa -o StrictHostKeyChecking=no -o UserKnownHostsFile=/dev/null -p 22775
buildbot@localhost
```

1. once inside the VM, perform the following steps:

```
cd /usr/local/src
sudo tar zxf /dev/shm/boost_1_49_0.tar.gz
cd /usr/local/include/
sudo rm boost
sudo ln -s ../src/boost_1_49_0/boost .
sudo /sbin/shutdown -h now
```

Installing VM Images for Testing .deb Upgrade Between Versions

This step creates virtual machine images used to do an important additional upgrade test for .debs. Each virtual machine is pre-installed with an older version of MariaDB, and the test tries upgrading this version to the newly build one (to check that dependencies etc. work out correctly).

This step may not be easily possible to replicate exactly for new or updated images. For example, when we add a new platform/distro, we will not have the same old version of MariaDB available for installation on the new planform. Or if needing to re-create an image in the future, the original old .debs used before may no longer be available. However, this is not a big problem, as we can just use whatever version of MariaDB is available. In fact, while we cannot reasonably test every possible upgrade combination between MariaDB versions, it is still useful to test upgrades from different versions on different platforms, to increase coverage a bit.

The bulk of the images were installed with the following two loops, using packages from the OurDelta repository for MariaDB 5.1.42, which was the one available from there at the time of installation.

```
for i in "vm-hardy-amd64-install qemu64 hardy" "vm-hardy-i386-install qemu32,-nx hardy" \
          "vm-intrepid-amd64-install qemu64 intrepid" "vm-intrepid-i386-install qemu32,-nx intrepid" \
          "vm-karmic-amd64-install qemu64 karmic" "vm-karmic-i386-install qemu32,-nx karmic" \
          "vm-jaunty-amd64-install qemu64 jaunty" "vm-jaunty-i386-deb-install qemu32,-nx jaunty" \
          "vm-debian5-amd64-install qemu64 lenny" "vm-debian5-i386-install qemu32,-nx lenny" ; do \
  set $i; \
  runvm -b  $1.qcow2 -m 512 --smp=1 --port=2200 --user=buildbot --cpu=$2 $(echo $1 | sed -e 's/-install/-
upgrade2/').qcow2 \
    "wget -O- http://ourdelta.org/deb/ourdelta.gpg | sudo apt-key add -" \
    "sudo sh -c \"echo 'deb http://mirror.ourdelta.org/deb $3 mariadb-ourdelta' >
/etc/apt/sources.list.d/ourdelta.list\"" \
    "sudo apt-get update || true" \
    "sudo DEBIAN_FRONTEND=noninteractive apt-get install -y mariadb-server mariadb-test libmariadbclient-
dev || true" \
    'mysql -uroot -prootpass -e "create database mytest; use mytest; create table t(a int primary key);
insert into t values (1); select * from t"' \
    "sudo rm /etc/apt/sources.list.d/ourdelta.list" \
    "sudo apt-get update || true" \
    "sudo DEBIAN_FRONTEND=noninteractive apt-get upgrade -y || true" ; \
done
```

```
for i in "vm-debian4-amd64-install qemu64 etch /kvm/debian-40r8-amd64-netinst.iso" "vm-debian4-i386-
install qemu32,-nx etch /kvm/debian-40r8-i386-netinst.iso" ; do \
  set $i; \
  runvm -b  $1.qcow2 -m 512 --smp=1 --port=2200 --user=buildbot --cpu=$2 --netdev=e1000 --kvm=-cdrom --
kvm=$4 $(echo $1 | sed -e 's/-install/-upgrade2/').qcow2 \
    "wget -O- http://ourdelta.org/deb/ourdelta.gpg | sudo apt-key add -" \
    "sudo sh -c \"echo 'deb http://mirror.ourdelta.org/deb $3 mariadb-ourdelta' >
/etc/apt/sources.list.d/ourdelta.list\"" \
    "sudo apt-get update || true" \
    "sudo sh -c 'DEBIAN_FRONTEND=noninteractive apt-get install -y mariadb-server mariadb-test
libmariadbclient-dev' || true" \
    'mysql -uroot -prootpass -e "create database mytest; use mytest; create table t(a int primary key);
insert into t values (1); select * from t"' \
    "sudo rm /etc/apt/sources.list.d/ourdelta.list" \
    "sudo apt-get update || true" \
    "sudo sh -c 'DEBIAN_FRONTEND=noninteractive apt-get upgrade -y' || true" ; \
done
```

The Ubuntu 10.04 “lucid” images were installed manually (as no packages for lucid were available from OurDelta at the time of installation):

Create and boot 64-bit lucid upgrade image:

```
qemu-img create -b vm-lucid-amd64-install.qcow2 -f qcow2 vm-lucid-amd64-upgrade2.qcow2
kvm -m 512 -hda vm-lucid-amd64-upgrade2.qcow2 -redir 'tcp:2200::22' -boot c -smp 1 -cpu qemu64 -net
nic,model=virtio -net user -nographic
```

Create directory inside the image:

```
mkdir buildbot
```

Copy in packages to be installed from outside:

```
scp -P 2200 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no -r /archive/pack/mariadb-5.1-
knielsen/build-277/kvm-deb-lucid-amd64/debs buildbot@localhost:buildbot/
```

Install the MariaDB packages, remove package dir, and upgrade to latest security fixes:

```
sudo apt-get update
sudo DEBIAN_FRONTEND=noninteractive apt-get install -y --allow-unauthenticated mariadb-server mariadb-
test libmariadbclient-dev
mysql -uroot -prootpass -e "create database mytest; use mytest; create table t(a int primary key); insert
into t values (1); select * from t"
rm -Rf buildbot
sudo apt-get update
sudo DEBIAN_FRONTEND=noninteractive apt-get upgrade -y
```

Now the same, but for 32-bit lucid:

```
qemu-img create -b vm-lucid-i386-install.qcow2 -f qcow2 vm-lucid-i386-upgrade2.qcow2
kvm -m 512 -hda vm-lucid-i386-upgrade2.qcow2 -redir 'tcp:2200::22' -boot c -smp 1 -cpu qemu32,-nx -net
nic,model=virtio -net user -nographic
```

Create directory inside the image:

```
mkdir buildbot
```

Copy in packages to be installed from outside:

```
scp -P 2200 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no -r /archive/pack/mariadb-5.1-
knielsen/build-277/kvm-deb-lucid-x86/debs buildbot@localhost:buildbot/
```

Install the MariaDB packages, remove package dir, and upgrade to latest security fixes:

```
sudo apt-get update
sudo DEBIAN_FRONTEND=noninteractive apt-get install -y --allow-unauthenticated mariadb-server mariadb-
test libmariadbclient-dev
mysql -uroot -prootpass -e "create database mytest; use mytest; create table t(a int primary key); insert
into t values (1); select * from t"
rm -Rf buildbot
sudo apt-get update
sudo DEBIAN_FRONTEND=noninteractive apt-get upgrade -y
```

The Ubuntu 10.10 “maverick” images were likewise installed manually:

Create and boot 64-bit maverick upgrade image:

```
qemu-img create -b vm-maverick-amd64-install.qcow2 -f qcow2 vm-maverick-amd64-upgrade2.qcow2
kvm -m 512 -hda vm-maverick-amd64-upgrade2.qcow2 -redir 'tcp:2200::22' -boot c -smp 1 -cpu qemu64 -net
nic,model=virtio -net user -nographic

ssh -p 2200 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no buildbot@localhost mkdir buildbot
scp -P 2200 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no -r /archive/pack/mariadb-5.1-
knielsen/build-619/kvm-deb-maverick-amd64/debs buildbot@localhost:buildbot/
ssh -p 2200 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no buildbot@localhost

sudo apt-get update
sudo DEBIAN_FRONTEND=noninteractive apt-get install -y --allow-unauthenticated mariadb-server mariadb-
test libmariadbclient-dev
mysql -uroot -prootpass -e "create database mytest; use mytest; create table t(a int primary key); insert
into t values (1); select * from t"
rm -Rf buildbot
sudo apt-get update
sudo DEBIAN_FRONTEND=noninteractive apt-get upgrade -y
```

Same for 32-bit maverick:

```
qemu-img create -b vm-maverick-i386-install.qcow2 -f qcow2 vm-maverick-i386-upgrade2.qcow2
kvm -m 512 -hda vm-maverick-i386-upgrade2.qcow2 -redir 'tcp:2200::22' -boot c -smp 1 -cpu qemu32,-nx -net
nic,model=virtio -net user -nographic

ssh -p 2200 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no buildbot@localhost mkdir buildbot
scp -P 2200 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no -r /archive/pack/mariadb-5.1-
knielsen/build-619/kvm-deb-maverick-x86/debs buildbot@localhost:buildbot/
ssh -p 2200 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no buildbot@localhost

sudo apt-get update
sudo DEBIAN_FRONTEND=noninteractive apt-get install -y --allow-unauthenticated mariadb-server mariadb-
test libmariadbclient-dev
mysql -uroot -prootpass -e "create database mytest; use mytest; create table t(a int primary key); insert
into t values (1); select * from t"
rm -Rf buildbot
sudo apt-get update
sudo DEBIAN_FRONTEND=noninteractive apt-get upgrade -y
```

For Ubuntu 11.04 “natty”, mariadb packages were installed from the repository for the previous version.

64-bit Ubuntu natty:

```
qemu-img create -b vm-natty-amd64-install.qcow2 -f qcow2 vm-natty-amd64-upgrade2.qcow2
kvm -m 512 -hda vm-natty-amd64-upgrade2.qcow2 -redir 'tcp:2200::22' -boot c -smp 1 -cpu qemu64 -net
nic,model=virtio -net user -nographic
ssh -p 2200 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no buildbot@localhost

sudo sh -c 'cat > /etc/apt/sources.list.d/tmp.list'
deb http://ftp.osuosl.org/pub/mariadb/repo/5.1/ubuntu maverick main
deb-src http://ftp.osuosl.org/pub/mariadb/repo/5.1/ubuntu maverick main

sudo apt-get update
sudo DEBIAN_FRONTEND=noninteractive apt-get install -y --allow-unauthenticated mariadb-server mariadb-
test libmariadbclient-dev
mysql -uroot -prootpass -e "create database mytest; use mytest; create table t(a int primary key); insert
into t values (1); select * from t"
sudo rm /etc/apt/sources.list.d/tmp.list
sudo apt-get update
sudo DEBIAN_FRONTEND=noninteractive apt-get upgrade -y
```

32-bit Ubuntu natty:

```
qemu-img create -b vm-natty-i386-install.qcow2 -f qcow2 vm-natty-i386-upgrade2.qcow2
kvm -m 512 -hda vm-natty-i386-upgrade2.qcow2 -redir 'tcp:2200::22' -boot c -smp 1 -cpu qemu64 -net
nic,model=virtio -net user -nographic
ssh -p 2200 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no buildbot@localhost

sudo sh -c 'cat > /etc/apt/sources.list.d/tmp.list'
deb http://ftp.osuosl.org/pub/mariadb/repo/5.1/ubuntu maverick main
deb-src http://ftp.osuosl.org/pub/mariadb/repo/5.1/ubuntu maverick main

sudo apt-get update
sudo DEBIAN_FRONTEND=noninteractive apt-get install -y --allow-unauthenticated mariadb-server mariadb-
test libmariadbclient-dev
mysql -uroot -prootpass -e "create database mytest; use mytest; create table t(a int primary key); insert
into t values (1); select * from t"
sudo rm /etc/apt/sources.list.d/tmp.list
sudo apt-get update
sudo DEBIAN_FRONTEND=noninteractive apt-get upgrade -y
```

For Ubuntu 11.10 “oneiric”. The steps performed are listed at: Buildbot Setup for Virtual Machines - Ubuntu 11.10 “oneiric” (in the VMs for Upgrade Testing section)

This page is licensed: CC BY-SA / Gnu FDL

Resizing a Virtual Machine Image

Some KVM images end up not having enough space on them. In such cases, it is preferable to increase the size of the VM rather than to just delete an image and rebuild it from scratch. The steps outlined below document what was done to increase the size of the Red Hat 5 x86 VM and should be able to be easily adapted to other VMs, should they need the same treatment in the future.

1. Make a copy of the VM to work on (we don’t want to change the original):

```
cp -avi vm-rhel5-x86-build.qcow2 vm-rhel5-x86-build-new.qcow2
```

1. Using the `qemu-img` command, resize the image:

```
qemu-img info vm-rhel5-x86-build-new.qcow2
qemu-img resize vm-rhel5-x86-build-new.qcow2 +10G
qemu-img info vm-rhel5-x86-build-new.qcow2
rsync -avP vm-rhel5-x86-build-new.qcow2 terrier:/kvm/vms/
```

Not all versions of `qemu-img` can resize VMs.

1. Boot the newly resized image with gparted:

```
vm=vm-rhel5-x86-build-new.qcow2
kvm -m 2048 -hda /kvm/vms/${vm} -cdrom /kvm/iso/gparted-live-0.14.1-6-i486.iso -boot d -smp 2 -cpu qemu64
-net nic,model=virtio -net user,hostfwd=tcp:127.0.0.1:22666-:22
```

1. Connect to the VM using VNC from your local machine:

```
vncviewer -via <vmhost> localhost
```

Midway through booting you’ll have to reconnect

1. Use gparted to either expand the existing primary partition or, especially on VMs with LVM, add a new partition (since GParted can’t change LVM partitions). Exit when finished and shutdown the VM.
2. Boot the VM again, this time without a VNC server:

```
kvm -m 2048 -hda /kvm/vms/${vm} -boot c -smp 2 -cpu qemu64 -net nic,model=virtio -net
user,hostfwd=tcp:127.0.0.1:22666-:22 -nographic
```

1. login to the VM:

```
ssh -t -p 22666 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no -i ~/.ssh/buildbot.id_dsa
buildbot@localhost
```

1. if expanded an existing partition: verify the new size
2. else if you created a new partition:

- mount the new partition to tmp location

```
sudo mount /dev/hda3 /mnt
```

- rsync contents of /home/ to the new partition

```
sudo rsync -avP /home/ /mnt/
```

- edit fstab to mount new partition to /home

```
sudo vi /etc/fstab
```

- mv `/home` to `/home-old`, create `/home` dir, mount `/home`

```
sudo mv -vi /home /home-old;sudo mkdir -v /home;sudo mount /home
```

- (optional) unmount `/mnt`

```
sudo umount /mnt
```

- reboot and verify that things look good

```
sudo /sbin/shutdown -h now
```

- if things do look good (new drive mounted OK, accounts work, etc…), delete `/home-old`

1. Move the old VM to `-old` and the `-new` VM to what the old VM used to be named

```
sudo mv -vi /kvm/vms/vm-rhel5-x86-build.qcow2 vm-rhel5-x86-build-old.qcow2; sudo mv -vi /kvm/vms/vm-
rhel5-x86-build-new.qcow2 /kvm/vms/vm-rhel5-x86-build.qcow2
```

1. on other VM hosts, make a copy of the old file then rsync over the updated files (the copy helps speed up the rsync):

```
sudo cp -avi /kvm/vms/vm-rhel5-x86-build.qcow2 /kvm/vms/vm-rhel5-x86-build-old.qcow2
sudo rsync -avP terrier.askmonty.org::kvm/vms/vm-rhel5-x86-build* /kvm/vms/
```

1. Test the new VM with a build to make sure it works

Update Debian 4 Mirrors for Buildbot VMs

Debian 4 has become so old that the apt repository has been moved out of the main Debian 4 mirror servers, and into the archive of old versions. This needs to be fixed by pointing the Debian 4 images to a different mirror:

64-bit:

```
kvm -m 512 -hda vm-debian4-amd64-install.qcow2 -redir 'tcp:2200::22' -boot c -smp 1 -cpu qemu64 -net
nic,model=e1000 -net user -nographic

sudo vi /etc/apt/sources.list
# replace http://ftp.dk.debian.org/debian/ with http://ftp.de.debian.org/archive/debian/
```

32-bit:

```
kvm -m 512 -hda vm-debian4-i386-install.qcow2 -redir 'tcp:2200::22' -boot c -smp 1 -cpu qemu64 -net
nic,model=e1000 -net user -nographic

sudo vi /etc/apt/sources.list
# replace http://ftp.dk.debian.org/debian/ with http://ftp.de.debian.org/archive/debian/
```

After that, it is necessary to re-do from scratch the -update and -update2 debian4 images (as these are built on top of the -install images).

Buildbot Setup for Virtual Machines - Debian 4 amd64

```
cd /kvm/vms
qemu-img create -f qcow2 vm-debian4-amd64-serial.qcow2 8G
kvm -m 2047 -hda /kvm/vms/vm-debian4-amd64-serial.qcow2 -cdrom /kvm/debian-40r8-amd64-netinst.iso -redir
'tcp:2240::22' -boot d -smp 2 -cpu qemu64 -net nic,model=e1000 -net user
```

Serial console and account setup

From base install, setup for serial port, and setup accounts for passwordless ssh login and sudo:

```
kvm -m 2047 -hda /kvm/vms/vm-debian4-amd64-serial.qcow2 -cdrom /kvm/debian-40r8-amd64-netinst.iso -redir
'tcp:2240::22' -boot c -smp 2 -cpu qemu64 -net nic,model=e1000 -net user

su
apt-get install sudo openssh-server
VISUAL=vi visudo
# Add at the end:t %sudo ALL=NOPASSWD: ALL

# Add account <USER> to group sudo
# Copy in public ssh key.

# Add in /etc/inittab:
S0:2345:respawn:/sbin/getty -L ttyS0 19200 vt100
```

Add to /boot/grub/menu.lst:

```
serial --unit=0 --speed=115200 --word=8 --parity=no --stop=1
terminal --timeout=3 serial console
```

also add in menu.lst to kernel line:

```
console=tty0 console=ttyS0,115200n8

# Add user buildbot, with disabled password. Add as sudo, and add ssh key.
sudo /usr/sbin/adduser --disabled-password buildbot
sudo /usr/sbin/adduser buildbot sudo
sudo su - buildbot
mkdir .ssh
# Add all necessary keys.
cat >.ssh/authorized_keys
chmod -R go-rwx .ssh
```

VM for build

```
qemu-img create -b vm-debian4-amd64-serial.qcow2 -f qcow2 vm-debian4-amd64-build.qcow2
kvm -m 2047 -hda /kvm/vms/vm-debian4-amd64-build.qcow2 -cdrom /kvm/debian-40r8-amd64-netinst.iso -redir
'tcp:2240::22' -boot c -smp 2 -cpu qemu64 -net nic,model=e1000 -net user -nographic

sudo apt-get build-dep mysql-server-5.0
# Some latex packages fail to install because they complain that the
# source is more than 5 years old! I solved by setting back the clock a
# couple of years temporarily ...
sudo apt-get install devscripts doxygen texlive-latex-base gs lsb-release fakeroot libevent-dev libssl-
dev zlib1g-dev libreadline5-dev
```

VM for install testing

```
qemu-img create -b vm-debian4-amd64-serial.qcow2 -f qcow2 vm-debian4-amd64-install.qcow2
kvm -m 2047 -hda /kvm/vms/vm-debian4-amd64-install.qcow2 -cdrom /kvm/debian-40r8-amd64-netinst.iso -redir
'tcp:2240::22' -boot c -smp 2 -cpu qemu64 -net nic,model=e1000 -net user -nographic
```

See the General Principles article for how to make the '`my.seed`' file.

```
# No packages mostly!
sudo apt-get install debconf-utils

cat >>/etc/apt/sources.list <<END
deb file:///home/buildbot/buildbot/debs binary/
deb-src file:///home/buildbot/buildbot/debs source/
END

sudo debconf-set-selections /tmp/my.seed
```

VM for upgrade testing

```
qemu-img create -b vm-debian4-amd64-install.qcow2 -f qcow2 vm-debian4-amd64-upgrade.qcow2
kvm -m 2047 -hda /kvm/vms/vm-debian4-amd64-upgrade.qcow2 -cdrom /kvm/debian-40r8-amd64-netinst.iso -redir
'tcp:2240::22' -boot c -smp 2 -cpu qemu64 -net nic,model=e1000 -net user -nographic

sudo apt-get install mysql-server-5.0
mysql -uroot -prootpass -e "create database mytest; use mytest; create table t(a int primary key); insert
into t values (1); select * from t"
```

This page is licensed: CC BY-SA / Gnu FDL

Buildbot Setup for Virtual Machines - Debian 4 i386

Create the VM:

```
cd /kvm/vms
qemu-img create -f qcow2 vm-debian4-i386-serial.qcow2 8G
kvm -m 2047 -hda /kvm/vms/vm-debian4-i386-serial.qcow2 -cdrom /kvm/debian-40r8-i386-netinst.iso -redir
'tcp:2241::22' -boot d -smp 2 -cpu qemu32,-nx -net nic,model=e1000 -net user
```

Serial console and account setup

From base install, setup for serial port, and setup accounts for passwordless ssh login and sudo:

```
kvm -m 2047 -hda /kvm/vms/vm-debian4-i386-serial.qcow2 -cdrom /kvm/debian-40r8-i386-netinst.iso -redir
'tcp:2241::22' -boot c -smp 2 -cpu qemu32,-nx -net nic,model=e1000 -net user

su
apt-get install sudo openssh-server
VISUAL=vi visudo

# Add at the end:t %sudo ALL=NOPASSWD: ALL

# Add account <USER> to group sudo
# Copy in public ssh key.

# Add in /etc/inittab:
S0:2345:respawn:/sbin/getty -L ttyS0 19200 vt100
```

Add to /boot/grub/menu.lst:

```
serial --unit=0 --speed=115200 --word=8 --parity=no --stop=1
terminal --timeout=3 serial console
```

also add in menu.lst to kernel line:

```
console=tty0 console=ttyS0,115200n8
```

Do these steps:

```
# Add user buildbot, with disabled password. Add as sudo, and add ssh key.
sudo /usr/sbin/adduser --disabled-password buildbot
sudo /usr/sbin/adduser buildbot sudo
sudo su - buildbot
mkdir .ssh
# Add all necessary keys.
cat >.ssh/authorized_keys
chmod -R go-rwx .ssh
```

VM for build

```
qemu-img create -b vm-debian4-i386-serial.qcow2 -f qcow2 vm-debian4-i386-build.qcow2
kvm -m 2047 -hda /kvm/vms/vm-debian4-i386-build.qcow2 -cdrom /kvm/debian-40r8-i386-netinst.iso -redir
'tcp:2241::22' -boot c -smp 2 -cpu qemu32,-nx -net nic,model=e1000 -net user -nographic

sudo apt-get build-dep mysql-server-5.0
# Some latex packages fail to install because they complain that the
# source is more than 5 years old! I solved by setting back the clock a
# couple of years temporarily ...
sudo apt-get install devscripts doxygen texlive-latex-base gs lsb-release fakeroot libevent-dev libssl-
dev zlib1g-dev libreadline5-dev
```

VM for install testing

```
qemu-img create -b vm-debian4-i386-serial.qcow2 -f qcow2 vm-debian4-i386-install.qcow2
kvm -m 2047 -hda /kvm/vms/vm-debian4-i386-install.qcow2 -cdrom /kvm/debian-40r8-i386-netinst.iso -redir
'tcp:2241::22' -boot c -smp 2 -cpu qemu32,-nx -net nic,model=e1000 -net user -nographic
```

See the General Principles article for how to make the '`my.seed`' file.

```
# No packages mostly!
sudo apt-get install debconf-utils

cat >>/etc/apt/sources.list <<END
deb file:///home/buildbot/buildbot/debs binary/
deb-src file:///home/buildbot/buildbot/debs source/
END

sudo debconf-set-selections /tmp/my.seed
```

VM for upgrade testing

```
qemu-img create -b vm-debian4-i386-install.qcow2 -f qcow2 vm-debian4-i386-upgrade.qcow2
kvm -m 2047 -hda /kvm/vms/vm-debian4-i386-upgrade.qcow2 -cdrom /kvm/debian-40r8-i386-netinst.iso -redir
'tcp:2241::22' -boot c -smp 2 -cpu qemu64 -net nic,model=e1000 -net user -nographic

sudo apt-get install mysql-server-5.0
mysql -uroot -prootpass -e "create database mytest; use mytest; create table t(a int primary key); insert
into t values (1); select * from t"
```

This page is licensed: CC BY-SA / Gnu FDL

Buildbot Setup for Virtual Machines - Debian 5 amd64

Download netinst CD image debian-503-amd64-netinst.iso

```
cd /kvm/vms
qemu-img create -f qcow2 vm-debian5-amd64-serial.qcow2 8G
kvm -m 2047 -hda /kvm/vms/vm-debian5-amd64-serial.qcow2 -cdrom /kvm/debian-503-amd64-netinst.iso -redir
'tcp:2234::22' -boot d -smp 2 -cpu qemu64 -net nic,model=virtio -net user
```

Serial console and account setup

From base install, setup for serial port, and setup accounts for passwordless ssh login and sudo:

```
kvm -m 2047 -hda /kvm/vms/vm-debian5-amd64-serial.qcow2 -redir 'tcp:2234::22' -boot c -smp 2 -cpu qemu64
-net nic,model=virtio -net user

su
apt-get install sudo openssh-server
visudo
# uncomment %sudo ALL=NOPASSWD: ALL
# add user account to group sudo `addgroup <USER> sudo`.
# Copy in public ssh key.

# Add in /etc/inittab:
S0:2345:respawn:/sbin/getty -L ttyS0 19200 vt100
```

Add to /boot/grub/menu.lst:

```
serial --unit=0 --speed=115200 --word=8 --parity=no --stop=1
terminal --timeout=3 serial console
```

also add in menu.lst to kernel line (after removing `quiet splash'):

```
console=tty0 console=ttyS0,115200n8
```

Add user buildbot, with disabled password. Add as sudo, and add ssh key.

```
sudo adduser --disabled-password buildbot
sudo adduser buildbot sudo
sudo su - buildbot
mkdir .ssh
# Add all necessary keys.
cat >.ssh/authorized_keys
chmod -R go-rwx .ssh
```

VM for building .deb

```
qemu-img create -b vm-debian5-amd64-serial.qcow2 -f qcow2 vm-debian5-amd64-build.qcow2
kvm -m 2047 -hda /kvm/vms/vm-debian5-amd64-build.qcow2 -redir 'tcp:2234::22' -boot c -smp 2 -cpu qemu64 -
net nic,model=virtio -net user -nographic

sudo apt-get build-dep mysql-server-5.0
sudo apt-get install devscripts hardening-wrapper doxygen texlive-latex-base ghostscript libevent-dev
libssl-dev zlib1g-dev libreadline5-dev
```

VM for install testing

```
qemu-img create -b vm-debian5-amd64-serial.qcow2 -f qcow2 vm-debian5-amd64-install.qcow2
kvm -m 2047 -hda /kvm/vms/vm-debian5-amd64-install.qcow2 -redir 'tcp:2234::22' -boot c -smp 2 -cpu qemu64
-net nic,model=virtio -net user -nographic

# No packages mostly!
sudo apt-get install debconf-utils

cat >>/etc/apt/sources.list <<END
deb file:///home/buildbot/buildbot/debs binary/
deb-src file:///home/buildbot/buildbot/debs source/
END

sudo debconf-set-selections /tmp/my.seed
```

See the General Principles article for how to make the '`my.seed`' file.

VM for upgrade testing

```
qemu-img create -b vm-debian5-amd64-install.qcow2 -f qcow2 vm-debian5-amd64-upgrade.qcow2
kvm -m 2047 -hda /kvm/vms/vm-debian5-amd64-upgrade.qcow2 -redir 'tcp:2234::22' -boot c -smp 2 -cpu qemu64
-net nic,model=virtio -net user -nographic

sudo apt-get install mysql-server-5.0
mysql -uroot -prootpass -e "create database mytest; use mytest; create table t(a int primary key); insert
into t values (1); select * from t"
```

Buildbot Setup for Virtual Machines - Debian 5 i386

Base install

Download netinst CD image debian-503-i386-netinst.iso and install:

```
cd /kvm
qemu-img create -f qcow2 vms/vm-debian5-i386-base.qcow2 8G
kvm -m 2047 -hda /kvm/vms/vm-debian5-i386-base.qcow2 -cdrom /kvm/debian-503-i386-netinst.iso -redir
'tcp:2226::22' -boot d -smp 2 -cpu qemu32,-nx -net nic,model=virtio -net user
```

Serial port console

From base install, setup for serial port, and setup accounts for passwordless ssh login and sudo:

```
qemu-img create -b vm-debian5-i386-base.qcow2 -f qcow2 vm-debian5-i386-serial.qcow2
kvm -m 2047 -hda /kvm/vms/vm-debian5-i386-serial.qcow2 -redir 'tcp:2226::22' -boot c -smp 2 -cpu qemu32,-
nx -net nic,model=virtio -net user -nographic
su
apt-get install sudo openssh-server emacs22-nox
visudo
# uncomment %sudo ALL=NOPASSWD: ALL
# add user account to group sudo.
# Copy in public ssh key.

# Add in /etc/inittab:
S0:2345:respawn:/sbin/agetty -h -L ttyS0 19200 vt100
```

Add to /boot/grub/menu.lst:

```
serial --unit=0 --speed=115200 --word=8 --parity=no --stop=1
terminal --timeout=3 serial console
```

also add in menu.lst to kernel line (after removing `quiet splash'):

```
console=tty0 console=ttyS0,115200n8
```

Add user buildbot, with disabled password. Add as sudo, and add ssh key.

```
sudo adduser --disabled-password buildbot
sudo adduser buildbot sudo
sudo su - buildbot
mkdir .ssh
# Paste all necessary keys.
cat >.ssh/authorized_keys
chmod -R go-rwx .ssh
```

Image for .deb build

```
qemu-img create -b vm-debian5-i386-serial.qcow2 -f qcow2 vm-debian5-i386-build.qcow2
kvm -m 2047 -hda /kvm/vms/vm-debian5-i386-build.qcow2 -redir 'tcp:2226::22' -boot c -smp 2 -cpu qemu32,-
nx -net nic,model=virtio -net user -nographic

sudo apt-get build-dep mysql-server-5.0
sudo apt-get install devscripts hardening-wrapper doxygen texlive-latex-base ghostscript libevent-dev
libssl-dev zlib1g-dev libreadline5-dev
```

Image for install testing

```
qemu-img create -b vm-debian5-i386-serial.qcow2 -f qcow2 vm-debian5-i386-install.qcow2
kvm -m 2047 -hda /kvm/vms/vm-debian5-i386-install.qcow2 -redir 'tcp:2226::22' -boot c -smp 2 -cpu
qemu32,-nx -net nic,model=virtio -net user -nographic

# No packages mostly!
sudo apt-get install debconf-utils

cat >>/etc/apt/sources.list <<END
deb file:///home/buildbot/buildbot/debs binary/
deb-src file:///home/buildbot/buildbot/debs source/
END

sudo debconf-set-selections /tmp/my.seed
```

See the General Principles article how to obtain the `my.seed` file.

Image for upgrade testing

```
qemu-img create -b vm-debian5-i386-install.qcow2 -f qcow2 vm-debian5-i386-upgrade.qcow2
kvm -m 2047 -hda /kvm/vms/vm-debian5-i386-upgrade.qcow2 -redir 'tcp:2226::22' -boot c -smp 2 -cpu
qemu32,-nx -net nic,model=virtio -net user -nographic

sudo apt-get install mysql-server-5.0
mysql -uroot -prootpass -e "create database mytest; use mytest; create table t(a int primary key); insert
into t values (1); select * from t"
```

This page is licensed: CC BY-SA / Gnu FDL

Buildbot Setup for Virtual Machines - Debian 6 amd64

Create the VM:

```
cd /kvm/vms
qemu-img create -f qcow2 vm-debian6-amd64-serial.qcow2 8G
kvm -m 2047 -hda /kvm/vms/vm-debian6-amd64-serial.qcow2 -cdrom /kvm/debian-6a1-amd64-netinst.iso -redir
'tcp:2244::22' -boot d -smp 2 -cpu qemu64 -net nic,model=virtio -net user
```

Serial console and account setup

From base install, setup for serial port, and setup accounts for passwordless ssh login and sudo:

```
kvm -m 2047 -hda /kvm/vms/vm-debian6-amd64-serial.qcow2 -redir 'tcp:2244::22' -boot c -smp 2 -cpu qemu64
-net nic,model=virtio -net user

su
apt-get install sudo openssh-server
visudo

# Add: %sudo ALL=NOPASSWD: ALL
# add user account to group sudo `addgroup <USER> sudo`.
# Copy in public ssh key.

# Add in /etc/inittab:
S0:2345:respawn:/sbin/getty -L ttyS0 19200 vt100
```

Editing /etc/default/grub:

```
sudo vi /etc/default/grub
# Add/edit these entries:
    GRUB_CMDLINE_LINUX_DEFAULT="console=tty0 console=ttyS0,115200n8"
    GRUB_TERMINAL="serial"
    GRUB_SERIAL_COMMAND="serial --unit=0 --speed=115200 --word=8 --parity=no --stop=1"

sudo update-grub
```

Add user buildbot, with disabled password. Add as sudo, and add ssh key.

```
sudo adduser --disabled-password buildbot
sudo adduser buildbot sudo
sudo su - buildbot
mkdir .ssh
# Add all necessary keys.
cat >.ssh/authorized_keys
chmod -R go-rwx .ssh
```

VM for building .deb

```
qemu-img create -b vm-debian6-amd64-serial.qcow2 -f qcow2 vm-debian6-amd64-build.qcow2
kvm -m 2047 -hda /kvm/vms/vm-debian6-amd64-build.qcow2 -redir 'tcp:2244::22' -boot c -smp 2 -cpu qemu64 -
net nic,model=virtio -net user -nographic

sudo apt-get build-dep mysql-server-5.1
sudo apt-get install devscripts hardening-wrapper doxygen texlive-latex-base ghostscript libevent-dev
libssl-dev zlib1g-dev libreadline-dev
```

VM for install testing

```
qemu-img create -b vm-debian6-amd64-serial.qcow2 -f qcow2 vm-debian6-amd64-install.qcow2
kvm -m 2047 -hda /kvm/vms/vm-debian6-amd64-install.qcow2 -redir 'tcp:2244::22' -boot c -smp 2 -cpu qemu64
-net nic,model=virtio -net user -nographic
```

See the General Principles article for how to make the '`my.seed`' file.

```
# No packages mostly!
sudo apt-get install debconf-utils

cat >>/etc/apt/sources.list <<END
deb file:///home/buildbot/buildbot/debs binary/
deb-src file:///home/buildbot/buildbot/debs source/
END

sudo debconf-set-selections /tmp/my.seed
```

VM for upgrade testing

```
qemu-img create -b vm-debian6-amd64-install.qcow2 -f qcow2 vm-debian6-amd64-upgrade.qcow2
kvm -m 2047 -hda /kvm/vms/vm-debian6-amd64-upgrade.qcow2 -redir 'tcp:2244::22' -boot c -smp 2 -cpu qemu64
-net nic,model=virtio -net user -nographic

sudo apt-get install mysql-server-5.1
mysql -uroot -prootpass -e "create database mytest; use mytest; create table t(a int primary key); insert
into t values (1); select * from t"
```

Buildbot Setup for Virtual Machines - Debian 6 i386

Base Install

```
cd /kvm/vms
qemu-img create -f qcow2 vm-debian6-i386-serial.qcow2 8G
kvm -m 2047 -hda /kvm/vms/vm-debian6-i386-serial.qcow2 -cdrom /kvm/debian-6a1-i386-netinst.iso -redir
'tcp:2245::22' -boot d -smp 2 -cpu qemu64 -net nic,model=virtio -net user
```

Serial console and account setup

From base install, setup for serial port, and setup accounts for passwordless ssh login and sudo:

```
kvm -m 2047 -hda /kvm/vms/vm-debian6-i386-serial.qcow2 -redir 'tcp:2245::22' -boot c -smp 2 -cpu qemu64 -
net nic,model=virtio -net user

su
apt-get install sudo openssh-server
visudo
# Add: %sudo ALL=NOPASSWD: ALL
# add user account to group sudo `addgroup <USER> sudo`.
# Copy in public ssh key.

# Add in /etc/inittab:
S0:2345:respawn:/sbin/getty -L ttyS0 19200 vt100
```

Editing /etc/default/grub:

```
sudo vi /etc/default/grub

# Add/edit these entries:
    GRUB_CMDLINE_LINUX_DEFAULT="console=tty0 console=ttyS0,115200n8"
    GRUB_TERMINAL="serial"
    GRUB_SERIAL_COMMAND="serial --unit=0 --speed=115200 --word=8 --parity=no --stop=1"

sudo update-grub
```

Add user buildbot, with disabled password. Add as sudo, and add ssh key.

```
sudo adduser --disabled-password buildbot
sudo adduser buildbot sudo
sudo su - buildbot
mkdir .ssh
# Add all necessary keys.
cat >.ssh/authorized_keys
chmod -R go-rwx .ssh
```

VM for building .deb

```
qemu-img create -b vm-debian6-i386-serial.qcow2 -f qcow2 vm-debian6-i386-build.qcow2
kvm -m 2047 -hda /kvm/vms/vm-debian6-i386-build.qcow2 -redir 'tcp:2245::22' -boot c -smp 2 -cpu qemu64 -
net nic,model=virtio -net user -nographic

sudo apt-get build-dep mysql-server-5.1
sudo apt-get install devscripts hardening-wrapper doxygen texlive-latex-base ghostscript libevent-dev
libssl-dev zlib1g-dev libreadline-dev
```

VM for install testing

```
qemu-img create -b vm-debian6-i386-serial.qcow2 -f qcow2 vm-debian6-i386-install.qcow2
kvm -m 2047 -hda /kvm/vms/vm-debian6-i386-install.qcow2 -redir 'tcp:2245::22' -boot c -smp 2 -cpu qemu64
-net nic,model=virtio -net user -nographic
```

See above for how to obtain my.seed

```
# No packages mostly!
sudo apt-get install debconf-utils

cat >>/etc/apt/sources.list <<END
deb file:///home/buildbot/buildbot/debs binary/
deb-src file:///home/buildbot/buildbot/debs source/
END

sudo debconf-set-selections /tmp/my.seed
```

VM for upgrade testing

```
qemu-img create -b vm-debian6-i386-install.qcow2 -f qcow2 vm-debian6-i386-upgrade.qcow2
kvm -m 2047 -hda /kvm/vms/vm-debian6-i386-upgrade.qcow2 -redir 'tcp:2245::22' -boot c -smp 2 -cpu qemu64
-net nic,model=virtio -net user -nographic

sudo apt-get install mysql-server-5.1
mysql -uroot -prootpass -e "create database mytest; use mytest; create table t(a int primary key); insert
into t values (1); select * from t"
```

Buildbot Setup for Virtual Machines - Centos 5 amd64

Base install

```
cd /kvm
wget http://ftp.klid.dk/ftp/centos/5.3/isos/x86_64/CentOS-5.3-x86_64-bin-DVD.iso
qemu-img create -f qcow2 vms/vm-centos5-amd64-serial.qcow2 8G
kvm -m 2047 -hda /kvm/vms/vm-centos5-amd64-serial.qcow2 -cdrom CentOS-5.3-x86_64-bin-DVD.iso -redir
'tcp:2237::22' -boot d -smp 2 -cpu qemu64 -net nic,model=virtio -net user
```

Serial port and account setup

```
kvm -m 2047 -hda /kvm/vms/vm-centos5-amd64-serial.qcow2 -cdrom CentOS-5.3-i386-bin-DVD.iso -redir
'tcp:2237::22' -boot c -smp 2 -cpu qemu64 -net nic,model=virtio -net user -nographic
```

Add to /boot/grub/menu.lst:

```
serial --unit=0 --speed=115200 --word=8 --parity=no --stop=1
terminal --timeout=3 serial console
```

also add in menu.lst to kernel line (after removing `quiet splash'):

```
console=tty0 console=ttyS0,115200n8
```

Run these commands:

```
cat >>/etc/inittab <<END

# Serial console.
S0:2345:respawn:/sbin/agetty -h -L ttyS0 19200 vt100
END
```

```
useradd buildbot

# Password is disabled by default in Centos5.

usermod -a -G wheel buildbot
visudo

# Uncomment the line "%wheel        ALL=(ALL)       NOPASSWD: ALL"
# Comment out this line:
# Defaults    requiretty

# Put in public ssh key for own account and host buildbot account.
# Note that Centos5 seems to require .ssh/authorized_keys chmod go-rwx.

su - buildbot
mkdir .ssh
chmod go-rwx .ssh
cat >.ssh/authorized_keys
chmod go-rwx .ssh/authorized_keys
```

Image for rpm build

```
qemu-img create -b vm-centos5-amd64-serial.qcow2 -f qcow2 vm-centos5-amd64-build.qcow2
kvm -m 2047 -hda /kvm/vms/vm-centos5-amd64-build.qcow2 -cdrom /kvm/CentOS-5.3-x86_64-bin-DVD.iso -redir
'tcp:2237::22' -boot c -smp 2 -cpu qemu64 -net nic,model=virtio -net user -nographic
```

Install compilers etc:

```
sudo yum groupinstall "Development Tools"
sudo yum install gperf readline-devel ncurses-devel libaio-devel openssl-devel zlib-devel perl perl\
(DBI\)
```

Download 5.0 rpm for shared-compat:

```
sudo mkdir -p /srv/shared/yum/CentOS/5/x86_64/RPMS/
cd /srv/shared/yum/CentOS/5/x86_64/RPMS/
sudo wget http://mirror.ourdelta.org/yum/CentOS/5/x86_64/RPMS/MySQL-OurDelta-shared-5.0.87.d10-
65.el5.x86_64.rpm
```

Image for install/test

```
qemu-img create -b vm-centos5-amd64-serial.qcow2 -f qcow2 vm-centos5-amd64-install.qcow2
kvm -m 2047 -hda /kvm/vms/vm-centos5-amd64-install.qcow2 -cdrom /kvm/CentOS-5.3-x86_64-bin-DVD.iso -redir
'tcp:2237::22' -boot c -smp 2 -cpu qemu64 -net nic,model=virtio -net user -nographic
```

Install extra dependencies:

```
sudo yum install perl perl\(DBI\)
```

This page is licensed: CC BY-SA / Gnu FDL

Buildbot Setup for Virtual Machines - CentOS 5 i386

Base install

```
cd /kvm
qemu-img create -f qcow2 vms/vm-centos5-i386-base.qcow2 8G
# ISO (dvd) install:
kvm -m 2047 -hda /kvm/vms/vm-centos5-i386-base.qcow2 -cdrom CentOS-5.3-i386-bin-DVD.iso -redir
'tcp:2225::22' -boot d -smp 2 -cpu qemu32,-nx -net nic,model=virtio -net user
```

Configure for serial console

```
(cd vms && qemu-img create -b vm-centos5-i386-base.qcow2 -f qcow2 vm-centos5-i386-serial.qcow2)
kvm -m 2047 -hda /kvm/vms/vm-centos5-i386-serial.qcow2 -cdrom CentOS-5.3-i386-bin-DVD.iso -redir
'tcp:2225::22' -boot c -smp 2 -cpu qemu32,-nx -net nic,model=virtio -net user -nographic
```

Add to /boot/grub/menu.lst:

```
serial --unit=0 --speed=115200 --word=8 --parity=no --stop=1
terminal --timeout=3 serial console
```

also add in menu.lst to kernel line (after removing `quiet splash'):

```
console=tty0 console=ttyS0,115200n8
```

Add login prompt on serial console:

```
cat >>/etc/inittab <<END

# Serial console.
S0:2345:respawn:/sbin/agetty -h -L ttyS0 19200 vt100
END
```

Create account.

```
useradd buildbot
# Password is disabled by default in Centos5.
usermod -a -G wheel buildbot
visudo
# Uncomment the line "%wheel        ALL=(ALL)       NOPASSWD: ALL"
# Comment out this line:
# Defaults    requiretty

# Put in public ssh key for own account and host buildbot account.
# Note that Centos5 seems to require .ssh/authorized_keys chmod go-rwx.
su - buildbot
mkdir .ssh
chmod go-rwx .ssh
cat >.ssh/authorized_keys
# Paste the id_dsa.pub key, see above.
chmod go-rwx .ssh/authorized_keys
```

Image for rpm build

```
qemu-img create -b vm-centos5-i386-serial.qcow2 -f qcow2 vm-centos5-i386-build.qcow2
kvm -m 2047 -hda /kvm/vms/vm-centos5-i386-build.qcow2 -cdrom /kvm/CentOS-5.3-i386-bin-DVD.iso -redir
'tcp:2225::22' -boot c -smp 2 -cpu qemu32,-nx -net nic,model=virtio -net user -nographic
```

Install compilers etc:

```
sudo yum groupinstall "Development Tools"
sudo yum install gperf readline-devel ncurses-devel zlib-devel libaio-devel openssl-devel perl perl\
(DBI\)
```

Download 5.0 rpm for shared-compat:

```
sudo mkdir -p /srv/shared/yum/CentOS/5/i386/RPMS/
cd /srv/shared/yum/CentOS/5/i386/RPMS/
sudo wget http://mirror.ourdelta.org/yum/CentOS/5/i386/RPMS/MySQL-OurDelta-shared-5.0.87.d10-
65.el5.i386.rpm
```

Image for install/test

```
qemu-img create -b vm-centos5-i386-serial.qcow2 -f qcow2 vm-centos5-i386-install.qcow2
kvm -m 2047 -hda /kvm/vms/vm-centos5-i386-install.qcow2 -cdrom /kvm/CentOS-5.3-i386-bin-DVD.iso -redir
'tcp:2225::22' -boot c -smp 2 -cpu qemu32,-nx -net nic,model=virtio -net user -nographic
```

Install extra dependencies:

```
sudo yum install perl perl\(DBI\)
```

This page is licensed: CC BY-SA / Gnu FDL

Buildbot Setup for Virtual Machines - CentOS 6.2

Base install

```
qemu-img create -f qcow2 /kvm/vms/vm-centos6-amd64-serial.qcow2 8G
qemu-img create -f qcow2 /kvm/vms/vm-centos6-i386-serial.qcow2 8G
```

Start each VM booting from the server install iso one at a time and perform the following install steps:

```
kvm -m 1024 -hda /kvm/vms/vm-centos6-amd64-serial.qcow2 -cdrom /kvm/iso/centos/CentOS-6.2-x86_64-bin-
DVD1.iso -redir tcp:22255::22 -boot d -smp 2 -cpu qemu64 -net nic,model=virtio -net user
kvm -m 1024 -hda /kvm/vms/vm-centos6-i386-serial.qcow2 -cdrom /kvm/iso/centos/CentOS-6.2-i386-bin-
DVD1.iso -redir tcp:22256::22 -boot d -smp 2 -cpu qemu32,-nx -net nic,model=virtio -net user
```

Once running you can connect to the VNC server from your local host with:

```
vncviewer -via ${remote-host} localhost
```

Replace ${remote-host} with the host the vm is running on.

Note: When you activate the install, vncviewer may disconnect with a complaint about the rect being too large. This is fine. The CentOS installer has just resized the vnc screen. Simply reconnect.

Install, picking default options mostly, with the following notes:

- The Installer will throw up a “Storage Device Warning”, choose “Yes, discard any data”
- Set the hostname to centos6-amd64 (or centos6-i386)
- Click the “Configure Network” button on the Hostname screen.
  - Edit System eth0 to “connect automatically”
  - Apply and then close the “Network Connections” window
- Set Timezone to Europe/Helsinki (keep “System clock uses UTC” checked)
- When partitioning disks, choose “Use All Space”
  - do not check the “Encrypt system” checkbox
  - do check the “Review and modify partitioning layout” checkbox
  - Delete the LVM stuff and leaving the sda1 partition alone, repartition the physical volume as follows

Device	Size(MB)	Mount Point	Type	Format
sda2	5672	/	ext4	yes
sda3	(max allowable)	(n/a)	swap	yes

- Minimal install
- Customize Later

When the install is finished, you will be prompted to reboot. Go ahead and do so, but it will fail. Kill the VM (after the reboot fails) and start it up again:

```
kvm -m 1024 -hda /kvm/vms/vm-centos6-amd64-serial.qcow2 -redir tcp:22255::22 -boot c -smp 2 -cpu qemu64 -
net nic,model=virtio -net user

kvm -m 1024 -hda /kvm/vms/vm-centos6-i386-serial.qcow2 -redir tcp:22256::22 -boot c -smp 2 -cpu qemu32,-
nx -net nic,model=virtio -net user
```

You may connect via VNC as before, but ssh is probably preferred. Login as root.

Now that the VM is installed, it's time to configure it.

```
ssh -p 22255 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no -i ~/.ssh/buildbot.id_dsa
root@localhost
ssh -p 22256 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no -i ~/.ssh/buildbot.id_dsa
root@localhost
```

After logging in as root, create a local user

```
adduser ${username}
usermod -a -G wheel ${username}
passwd ${username}
```

Enable password-less sudo and serial console:

```
visudo
# Uncomment the line "%wheel        ALL=(ALL)       NOPASSWD: ALL"
# Comment out this line:
# Defaults    requiretty
```

Still logged in as root, add to /boot/grub/menu.lst:

```
serial --unit=0 --speed=115200 --word=8 --parity=no --stop=1
terminal --timeout=3 serial console
```

also add in menu.lst to kernel line (after removing 'quiet'):

```
console=tty0 console=ttyS0,115200n8
```

Add login prompt on serial console:

```
cat >>/etc/inittab <<END

# Serial console.
S0:2345:respawn:/sbin/agetty -h -L ttyS0 19200 vt100
END
```

Logout as root, and then, from the VM host server:

Install proper ssh:

```
ssh -t -p 22255 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no -i ~/.ssh/buildbot.id_dsa
localhost "sudo yum install openssh-server openssh-clients"
ssh -t -p 22256 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no -i ~/.ssh/buildbot.id_dsa
localhost "sudo yum install openssh-server openssh-clients"
```

Create a .ssh folder:

```
ssh -t -p 22255 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no -i ~/.ssh/buildbot.id_dsa
localhost "mkdir -v .ssh"
ssh -t -p 22256 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no -i ~/.ssh/buildbot.id_dsa
localhost "mkdir -v .ssh"
```

Copy over the authorized keys file:

```
scp -P 22255 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no /kvm/vms/authorized_keys
localhost:.ssh/
scp -P 22256 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no /kvm/vms/authorized_keys
localhost:.ssh/
```

Set permissions on the .ssh folder correctly:

```
ssh -t -p 22255 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no -i ~/.ssh/buildbot.id_dsa
localhost "chmod -R go-rwx .ssh"
ssh -t -p 22256 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no -i ~/.ssh/buildbot.id_dsa
localhost "chmod -R go-rwx .ssh"
```

Create the buildbot user:

```
ssh -p 22255 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no localhost 'chmod -R go-rwx .ssh;
sudo adduser buildbot; sudo usermod -a -G wheel buildbot; sudo mkdir ~buildbot/.ssh; sudo cp -vi
.ssh/authorized_keys ~buildbot/.ssh/; sudo chown -vR buildbot:buildbot ~buildbot/.ssh; sudo chmod -vR go-
rwx ~buildbot/.ssh'
ssh -p 22256 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no localhost 'chmod -R go-rwx .ssh;
sudo adduser buildbot; sudo usermod -a -G wheel buildbot; sudo mkdir ~buildbot/.ssh; sudo cp -vi
.ssh/authorized_keys ~buildbot/.ssh/; sudo chown -vR buildbot:buildbot ~buildbot/.ssh; sudo chmod -vR go-
rwx ~buildbot/.ssh'
```

Upload the ttyS0.conf file and put it where it goes:

```
scp -P 22255 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no /kvm/vms/ttyS0.conf
buildbot@localhost:
scp -P 22256 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no /kvm/vms/ttyS0.conf
buildbot@localhost:

ssh -p 22255 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no buildbot@localhost 'sudo cp -vi
ttyS0.conf /etc/init/; rm -v ttyS0.conf;'
ssh -p 22256 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no buildbot@localhost 'sudo cp -vi
ttyS0.conf /etc/init/; rm -v ttyS0.conf;'
```

Update the VM:

```
ssh -p 22255 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no buildbot@localhost
ssh -p 22256 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no buildbot@localhost
```

Once logged in:

```
sudo yum update
```

After updating, shut down the VM:

```
sudo shutdown -h now
```

VMs for building .rpms

```
for i in '/kvm/vms/vm-centos6-amd64-serial.qcow2 22255 qemu64' '/kvm/vms/vm-centos6-i386-serial.qcow2
22256 qemu64' ; do \
  set $i; \
  runvm --user=buildbot --logfile=kernel_$2.log --base-image=$1 --port=$2 --cpu=$3 "$(echo $1 | sed -e
's/serial/build/')" \
    "sudo yum -y groupinstall 'Development Tools'" \
    "sudo yum -y install wget tree gperf readline-devel ncurses-devel zlib-devel pam-devel libaio-devel
openssl-devel libxml2 libxml2-devel unixODBC-devel bzr perl perl\(DBI\)" \
    "sudo yum -y remove systemtap-sdt-dev" \
    "bzr co --lightweight lp:mariadb-native-client" \
    "sudo mkdir -vp /usr/src/redhat/SOURCES /usr/src/redhat/SPECS /usr/src/redhat/RPMS
/usr/src/redhat/SRPMS" \
    "wget http://www.cmake.org/files/v2.8/cmake-2.8.8.tar.gz;tar -zxvf cmake-2.8.8.tar.gz;cd cmake-
2.8.8;./configure;make;sudo make install"; \
done
```

Also:

- Installing the Boost library needed for the OQGraph storage engine

VMs for install testing.

`MariaDB.local.repo` points at a local directory on the VM. `MariaDB.repo` points at the real MariaDB YUM repository.

```
for i in '/kvm/vms/vm-centos6-amd64-serial.qcow2 22255 qemu64' '/kvm/vms/vm-centos6-i386-serial.qcow2
22256 qemu64' ; do \
  set $i; \
  runvm --user=buildbot --logfile=kernel_$2.log --base-image=$1 --port=$2 --cpu=$3 "$(echo $1 | sed -e
's/serial/install/')" \
    "sudo yum -y update" \
    "sudo yum -y install patch libaio perl perl-Time-HiRes perl-DBI libtool-ltdl unixODBC" \
    "= scp -P $2 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no /kvm/vms/MariaDB.local.repo
buildbot@localhost:/tmp/" \
    "sudo mv -vi /tmp/MariaDB.local.repo /etc/yum.repos.d/"; \
done
```

VMs for MySQL upgrade testing

```
for i in '/kvm/vms/vm-centos6-amd64-serial.qcow2 22255 qemu64' '/kvm/vms/vm-centos6-i386-serial.qcow2
22256 qemu64' ; do \
  set $i; \
  runvm --user=buildbot --logfile=kernel_$2.log --base-image=$1 --port=$2 --cpu=$3 "$(echo $1 | sed -e
's/serial/upgrade/')" \
    "sudo yum -y update" \
    'sudo yum -y install mysql-server libtool-ltdl unixODBC' \
    'sudo /etc/init.d/mysqld start' \
    'mysql -uroot -e "create database mytest; use mytest; create table t(a int primary key); insert into
t values (1); select * from t"' \
    "= scp -P $2 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no /kvm/vms/MariaDB.local.repo
buildbot@localhost:/tmp/" \
    "sudo mv -vi /tmp/MariaDB.local.repo /etc/yum.repos.d/"; \
done
```

The MariaDB upgrade testing VMs were not built. There is currently an error with installing MariaDB from the YUM repo.

VMs for MariaDB upgrade testing

```
for i in '/kvm/vms/vm-centos6-amd64-serial.qcow2 22255 qemu64' '/kvm/vms/vm-centos6-i386-serial.qcow2

Buildbot Setup for Virtual Machines - Fedora 16

Base Install

```
qemu-img create -f qcow2 /kvm/vms/vm-fedora16-i386-serial.qcow2 10G
qemu-img create -f qcow2 /kvm/vms/vm-fedora16-amd64-serial.qcow2 10G
```

Start each VM booting from the server install iso one at a time and perform the following install steps:

```
kvm -m 1024 -hda /kvm/vms/vm-fedora16-i386-serial.qcow2 -cdrom /kvm/iso/fedora/Fedora-16-i386-DVD.iso -
redir tcp:2263::22 -boot d -smp 2 -cpu qemu32,-nx -net nic,model=virtio -net user
kvm -m 1024 -hda /kvm/vms/vm-fedora16-amd64-serial.qcow2 -cdrom /kvm/iso/fedora/Fedora-16-x86_64-DVD.iso
-redir tcp:2264::22 -boot d -smp 2 -cpu qemu64 -net nic,model=virtio -net user
```

Once running you can connect to the VNC server from your local host with:

```
vncviewer -via ${remote-host} localhost
```

Replace ${remote-host} with the host the vm is running on.

Note: When you activate the install, vncviewer may disconnect with a complaint about the rect being too large. This is fine. The Fedora installer has just resized the vnc screen. Simply reconnect.

Install, picking default options mostly, with the following notes:

- The Installer will throw up a “Storage Device Warning”, choose “Yes, discard any data”
- Set the hostname to fedora16-amd64 (or fedora16-i386)
- Click the “Configure Network” button on the Hostname screen.
  - Edit System eth0 to “connect automatically”
  - Apply and then close the “Network Connections” window
- When partitioning disks, choose “Use All Space”
  - uncheck the “Use LVM” checkbox
  - do not check the “Encrypt system” checkbox

- Minimal install
- Customize Later

When the install is finished, you will be prompted to reboot. Go ahead and do so, but it will fail. Kill the VM (after the reboot fails) and start it up again:

```
kvm -m 1024 -hda /kvm/vms/vm-fedora16-i386-serial.qcow2 -redir tcp:2263::22 -boot c -smp 2 -cpu qemu32,-
nx -net nic,model=virtio -net user
kvm -m 1024 -hda /kvm/vms/vm-fedora16-amd64-serial.qcow2 -redir tcp:2264::22 -boot c -smp 2 -cpu qemu64 -
net nic,model=virtio -net user
```

Until the extra user is installed you must connect via VNC as before. SSH is preferred, so that's what we'll do first. Login as root.

```
ssh -p 2263 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no -i ~/.ssh/buildbot.id_dsa
root@localhost
ssh -p 2264 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no -i ~/.ssh/buildbot.id_dsa
root@localhost
```

After logging in as root, install proper ssh and then create a local user:

```
/sbin/chkconfig --level 35 network on
ifup eth0
yum install openssh-server openssh-clients
adduser ${username}
usermod -a -G wheel ${username}
passwd ${username}
```

Enable password-less sudo and serial console:

```
visudo
# Uncomment the line "%wheel        ALL=(ALL)       NOPASSWD: ALL"
# Comment out this line:
# Defaults    requiretty
```

Still logged in as root, add to /boot/grub/menu.lst:

Editing /boot/grub/menu.lst:

```
sudo vi /etc/default/grub

# Add/edit these entries:
    GRUB_CMDLINE_LINUX_DEFAULT="console=tty0 console=ttyS0,115200n8"
    GRUB_TERMINAL="serial"
    GRUB_SERIAL_COMMAND="serial --unit=0 --speed=115200 --word=8 --parity=no --stop=1"

grub2-mkconfig -o /boot/grub2/grub.cfg
```

Logout as root, and then, from the VM host server:

Create a .ssh folder:

```
ssh -t -p 2263 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no -i ~/.ssh/buildbot.id_dsa
localhost "mkdir -v .ssh"
ssh -t -p 2264 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no -i ~/.ssh/buildbot.id_dsa
localhost "mkdir -v .ssh"
```

Copy over the authorized keys file:

```
scp -P 2263 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no /kvm/vms/authorized_keys
localhost:.ssh/
scp -P 2264 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no /kvm/vms/authorized_keys
localhost:.ssh/
```

Set permissions on the .ssh folder correctly:

```
ssh -t -p 2263 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no -i ~/.ssh/buildbot.id_dsa
localhost "chmod -R go-rwx .ssh"
ssh -t -p 2264 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no -i ~/.ssh/buildbot.id_dsa
localhost "chmod -R go-rwx .ssh"
```

Create the buildbot user:

```
ssh -p 2263 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no localhost 'chmod -R go-rwx .ssh;
sudo adduser buildbot; sudo usermod -a -G wheel buildbot; sudo mkdir ~buildbot/.ssh; sudo cp -vi
.ssh/authorized_keys ~buildbot/.ssh/; sudo chown -vR buildbot:buildbot ~buildbot/.ssh; sudo chmod -vR go-
rwx ~buildbot/.ssh'
ssh -p 2264 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no localhost 'chmod -R go-rwx .ssh;
sudo adduser buildbot; sudo usermod -a -G wheel buildbot; sudo mkdir ~buildbot/.ssh; sudo cp -vi
.ssh/authorized_keys ~buildbot/.ssh/; sudo chown -vR buildbot:buildbot ~buildbot/.ssh; sudo chmod -vR go-
rwx ~buildbot/.ssh'
```

su to the local buildbot user and ssh to the vm to put the key in known_hosts:

For i386:

```
sudo su - buildbot
ssh -p 2263 buildbot@localhost
# exit, then exit again
```

For amd64:

```
sudo su - buildbot
ssh -p 2264 buildbot@localhost
# exit, then exit again
```

Upload the ttyS0 file and put it where it goes:

```
scp -P 2263 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no /kvm/vms/ttyS0
buildbot@localhost:
scp -P 2264 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no /kvm/vms/ttyS0
buildbot@localhost:

ssh -p 2263 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no buildbot@localhost 'sudo mv -vi
ttyS0 /etc/event.d/;'
ssh -p 2264 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no buildbot@localhost 'sudo mv -vi
ttyS0 /etc/event.d/;'
```

Update the VM:

```
ssh -p 2263 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no buildbot@localhost
ssh -p 2264 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no buildbot@localhost
```

Once logged in:

```
sudo yum update
```

After updating, shut down the VM:

```
sudo shutdown -h now
```

VMs for building .rpms

```
for i in '/kvm/vms/vm-fedora16-amd64-serial.qcow2 2264 qemu64' '/kvm/vms/vm-fedora16-i386-serial.qcow2
2263 qemu64' ; do \
  set $i; \
  runvm --user=buildbot --logfile=kernel_$2.log --base-image=$1 --port=$2 --cpu=$3 "$(echo $1 | sed -e
's/serial/build/')" \
    "sudo yum -y groupinstall 'Development Tools'" \
    "sudo yum -y install wget tree gperf readline-devel ncurses-devel zlib-devel pam-devel libaio-devel
openssl-devel perl perl\(DBI\)" \
    "sudo yum -y remove systemtap-sdt-dev" \
    "sudo mkdir -vp /usr/src/redhat/SOURCES /usr/src/redhat/SPECS /usr/src/redhat/RPMS
/usr/src/redhat/SRPMS" \
    "wget http://www.cmake.org/files/v2.8/cmake-2.8.8.tar.gz;tar -zxvf cmake-2.8.8.tar.gz;cd cmake-
2.8.8;./configure;make;sudo make install"; \
done
```

Also:

- Installing the Boost library needed for the OQGraph storage engine

VMs for install testing.

`MariaDB.local.repo` points at a local directory on the VM. `MariaDB.repo` points at the real MariaDB YUM repository.

```
for i in '/kvm/vms/vm-fedora16-amd64-serial.qcow2 2264 qemu64' '/kvm/vms/vm-fedora16-i386-serial.qcow2
2263 qemu64' ; do \
  set $i; \
  runvm --user=buildbot --logfile=kernel_$2.log --base-image=$1 --port=$2 --cpu=$3 "$(echo $1 | sed -e
's/serial/install/')" \
    "sudo yum -y update" \
    "sudo yum -y install libaio perl perl-Time-HiRes perl-DBI" \
    "= scp -P $2 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no /kvm/vms/MariaDB.local.repo
buildbot@localhost:/tmp/" \
    "sudo mv -vi /tmp/MariaDB.local.repo /etc/yum.repos.d/"; \
done
```

VMs for MySQL upgrade testing

```
for i in '/kvm/vms/vm-fedora16-amd64-serial.qcow2 2264 qemu64' '/kvm/vms/vm-fedora16-i386-serial.qcow2
2263 qemu64' ; do \
  set $i; \
  runvm --user=buildbot --logfile=kernel_$2.log --base-image=$1 --port=$2 --cpu=$3 "$(echo $1 | sed -e
's/serial/upgrade/')" \
    "sudo yum -y update" \
    'sudo yum -y install mysql-server' \
    'sudo systemctl enable mysqld.service' \
    'sudo systemctl start mysqld.service' \
    'mysql -uroot -e "create database mytest; use mytest; create table t(a int primary key); insert into
t values (1); select * from t"' \
    "= scp -P $2 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no /kvm/vms/MariaDB.local.repo
buildbot@localhost:/tmp/" \
    "sudo mv -vi /tmp/MariaDB.local.repo /etc/yum.repos.d/"; \
done
```

The MariaDB upgrade testing VMs were not built. Once we have MariaDB Fedora 16 RPMs, then I will attempt building this VM. For now, the placeholder text below is copied from the Buildbot Setup for Virtual Machines - CentOS 6.2 page.

VMs for MariaDB upgrade testing

```
for i in '/kvm/vms/vm-fedora16-amd64-serial.qcow2 2264 qemu64' '/kvm/vms/vm-fedora16-i386-serial.qcow2
2263 qemu64' ; do \
  set $i; \
  runvm --user=buildbot --logfile=kernel_$2.log --base-image=$1 --port=$2 --cpu=$3 "$(echo $1 | sed -e
's/serial/upgrade2/')" \
    'sudo yum -y update' \
    "= scp -P $2 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no /kvm/vms/MariaDB.repo
buildbot@localhost:/tmp/" \
    'sudo rpm --verbose --import http://downloads.mariadb.org/repo/RPM-GPG-KEY-MariaDB' \
    'sudo mv -vi /tmp/MariaDB.repo /etc/yum.repos.d/' \
    'sudo yum -y remove mysql-libs' \
    'sudo yum -y install MariaDB-server MariaDB-client MariaDB-test' \
    'sudo yum -y install cronie cronie-anacron crontabs.noarch postfix' \
    'sudo /etc/init.d/mysqld start' \
    'mysql -uroot -prootpass -e "create database mytest; use mytest; create table t(a int primary key);
insert into t values (1); select * from t"' \
    'sudo rm -v /etc/yum.repos.d/MariaDB.repo' \
    "= scp -P $2 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no /kvm/vms/MariaDB.local.repo
buildbot@localhost:/tmp/" \
    'sudo mv -vi /tmp/MariaDB.local.repo /etc/yum.repos.d/'; \
done
```

Buildbot Setup for Virtual Machines - Fedora 17

Base Install

```
qemu-img create -f qcow2 /kvm/vms/vm-fedora17-i386-serial.qcow2 10G
qemu-img create -f qcow2 /kvm/vms/vm-fedora17-amd64-serial.qcow2 10G
```

Start each VM booting from the server install iso one at a time and perform the following install steps:

```
kvm -m 1024 -hda /kvm/vms/vm-fedora17-i386-serial.qcow2 -cdrom /kvm/iso/fedora/Fedora-17-i386-DVD.iso -
redir tcp:2265::22 -boot d -smp 2 -cpu qemu32,-nx -net nic,model=virtio -net user
kvm -m 1024 -hda /kvm/vms/vm-fedora17-amd64-serial.qcow2 -cdrom /kvm/iso/fedora/Fedora-17-x86_64-DVD.iso
-redir tcp:2266::22 -boot d -smp 2 -cpu qemu64 -net nic,model=virtio -net user
```

Once running you can connect to the VNC server from your local host with:

```
vncviewer -via ${remote-host} localhost
```

Replace ${remote-host} with the host the vm is running on.

Note: When you activate the install, vncviewer may disconnect with a complaint about the rect being too large. This is fine. The Fedora installer has just resized the vnc screen. Simply reconnect.

Install, picking default options mostly, with the following notes:

- The Installer will throw up a “Storage Device Warning”, choose “Yes, discard any data”
- Set the hostname to fedora17-amd64 (or fedora17-i386)
- Click the “Configure Network” button on the Hostname screen.
  - Edit System eth0 to “connect automatically”
  - Apply and then close the “Network Connections” window
- When partitioning disks, choose “Use All Space”
  - uncheck the “Use LVM” checkbox
  - do not check the “Encrypt system” checkbox

- Minimal install
- Customize Later

When the install is finished, you will be prompted to reboot. Go ahead and do so, but it will fail. Kill the VM (after the reboot fails) and start it up again:

```
kvm -m 1024 -hda /kvm/vms/vm-fedora17-i386-serial.qcow2 -redir tcp:2265::22 -boot c -smp 2 -cpu qemu64 -
net nic,model=virtio -net user
kvm -m 1024 -hda /kvm/vms/vm-fedora17-amd64-serial.qcow2 -redir tcp:2266::22 -boot c -smp 2 -cpu qemu64 -
net nic,model=virtio -net user
```

Until the extra user is installed you must connect via VNC as before. SSH is preferred, so that's what we'll do first. Login as root.

```
ssh -p 2265 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no -i ~/.ssh/buildbot.id_dsa
root@localhost
ssh -p 2266 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no -i ~/.ssh/buildbot.id_dsa
root@localhost
```

After logging in as root, install proper ssh and then create a local user:

```
/sbin/chkconfig --level 35 network on
ifup eth0
yum install openssh-server openssh-clients
adduser ${username}
usermod -a -G wheel ${username}
passwd ${username}
```

Enable password-less sudo and serial console:

```
visudo
# Uncomment the line "%wheel        ALL=(ALL)       NOPASSWD: ALL"
# Comment out this line:
# Defaults    requiretty
```

Still logged in as root, add to /boot/grub/menu.lst:

Editing /boot/grub/menu.lst:

```
sudo vi /etc/default/grub

# Add/edit these entries:
    GRUB_CMDLINE_LINUX_DEFAULT="console=tty0 console=ttyS0,115200n8"
    GRUB_TERMINAL="serial"
    GRUB_SERIAL_COMMAND="serial --unit=0 --speed=115200 --word=8 --parity=no --stop=1"

grub2-mkconfig -o /boot/grub2/grub.cfg
```

Logout as root, and then, from the VM host server:

Create a .ssh folder:

```
ssh -t -p 2265 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no -i ~/.ssh/buildbot.id_dsa
localhost "mkdir -v .ssh"
ssh -t -p 2266 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no -i ~/.ssh/buildbot.id_dsa
localhost "mkdir -v .ssh"
```

Copy over the authorized keys file:

```
scp -P 2265 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no /kvm/vms/authorized_keys
localhost:.ssh/
scp -P 2266 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no /kvm/vms/authorized_keys
localhost:.ssh/
```

Set permissions on the .ssh folder correctly:

```
ssh -t -p 2265 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no -i ~/.ssh/buildbot.id_dsa
localhost "chmod -R go-rwx .ssh"
ssh -t -p 2266 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no -i ~/.ssh/buildbot.id_dsa
localhost "chmod -R go-rwx .ssh"
```

Create the buildbot user:

```
ssh -p 2265 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no localhost 'chmod -R go-rwx .ssh;
sudo adduser buildbot; sudo usermod -a -G wheel buildbot; sudo mkdir ~buildbot/.ssh; sudo cp -vi
.ssh/authorized_keys ~buildbot/.ssh/; sudo chown -vR buildbot:buildbot ~buildbot/.ssh; sudo chmod -vR go-
rwx ~buildbot/.ssh'
ssh -p 2266 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no localhost 'chmod -R go-rwx .ssh;
sudo adduser buildbot; sudo usermod -a -G wheel buildbot; sudo mkdir ~buildbot/.ssh; sudo cp -vi
.ssh/authorized_keys ~buildbot/.ssh/; sudo chown -vR buildbot:buildbot ~buildbot/.ssh; sudo chmod -vR go-
rwx ~buildbot/.ssh'
```

su to the local buildbot user and ssh to the vm to put the key in known_hosts:

For i386:

```
sudo su - buildbot
ssh -p 2265 buildbot@localhost
# exit, then exit again
```

For amd64:

```
sudo su - buildbot
ssh -p 2266 buildbot@localhost
# exit, then exit again
```

Upload the ttyS0 file and put it where it goes:

```
scp -P 2265 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no /kvm/vms/ttyS0
buildbot@localhost:
scp -P 2266 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no /kvm/vms/ttyS0
buildbot@localhost:

ssh -p 2265 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no buildbot@localhost 'sudo mkdir -v
/etc/event.d;sudo mv -vi ttyS0 /etc/event.d/;'
ssh -p 2266 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no buildbot@localhost 'sudo mkdir -v
/etc/event.d;sudo mv -vi ttyS0 /etc/event.d/;'
```

Update the VM:

```
ssh -p 2265 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no buildbot@localhost
ssh -p 2266 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no buildbot@localhost
```

Once logged in:

```
sudo yum update
```

After updating, shut down the VM:

```
sudo shutdown -h now
```

VMs for building .rpms

On the VM host server:

```
qemu-img create -b /kvm/vms/vm-fedora17-i386-serial.qcow2 -f qcow2 /kvm/vms/vm-fedora17-i386-build.qcow2
qemu-img create -b /kvm/vms/vm-fedora17-amd64-serial.qcow2 -f qcow2 /kvm/vms/vm-fedora17-amd64-
build.qcow2
```

Boot the VMs with:

```
kvm -m 1024 -hda /kvm/vms/vm-fedora17-i386-build.qcow2 -redir tcp:2265::22 -boot c -smp 2 -cpu qemu64 -
net nic,model=virtio -net user -nographic
kvm -m 1024 -hda /kvm/vms/vm-fedora17-amd64-build.qcow2 -redir tcp:2266::22 -boot c -smp 2 -cpu qemu64 -
net nic,model=virtio -net user -nographic
```

Copy over the boost tar file:

```
scp -P 2265 -i /kvm/vms/ssh-keys/id_dsa -o StrictHostKeyChecking=no -o UserKnownHostsFile=/dev/null
/kvm/boost_1_49_0.tar.gz buildbot@localhost:/dev/shm/
scp -P 2266 -i /kvm/vms/ssh-keys/id_dsa -o StrictHostKeyChecking=no -o UserKnownHostsFile=/dev/null
/kvm/boost_1_49_0.tar.gz buildbot@localhost:/dev/shm/
```

Login to the VMs:

```
ssh -p 2265 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no buildbot@localhost
ssh -p 2266 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no buildbot@localhost
```

Once logged in:

```
sudo yum -y groupinstall 'Development Tools'
sudo yum -y install tar wget tree gperf readline-devel ncurses-devel zlib-devel pam-devel libaio-devel
openssl-devel perl perl\(DBI\)
sudo yum -y remove systemtap-sdt-dev
sudo mkdir -vp /usr/src/redhat/SOURCES /usr/src/redhat/SPECS /usr/src/redhat/RPMS /usr/src/redhat/SRPMS

# cmake
wget http://www.cmake.org/files/v2.8/cmake-2.8.8.tar.gz;tar -zxvf cmake-2.8.8.tar.gz;cd cmake-
2.8.8;./configure;make;sudo make install

# boost
cd /usr/local/src;sudo tar zxf /dev/shm/boost_1_49_0.tar.gz;cd /usr/local/include/;sudo ln -s
../src/boost_1_49_0/boost .

# shutdown the VM
sudo shutdown -h now
```

VMs for install testing.

On the VM host server:

```
qemu-img create -b /kvm/vms/vm-fedora17-i386-serial.qcow2 -f qcow2 /kvm/vms/vm-fedora17-i386-
install.qcow2
qemu-img create -b /kvm/vms/vm-fedora17-amd64-serial.qcow2 -f qcow2 /kvm/vms/vm-fedora17-amd64-
install.qcow2
```

Boot the VMs with:

```
kvm -m 1024 -hda /kvm/vms/vm-fedora17-i386-install.qcow2 -redir tcp:2265::22 -boot c -smp 2 -cpu qemu64 -
net nic,model=virtio -net user -nographic
kvm -m 1024 -hda /kvm/vms/vm-fedora17-amd64-install.qcow2 -redir tcp:2266::22 -boot c -smp 2 -cpu qemu64
-net nic,model=virtio -net user -nographic
```

Login to the VMs:

```
ssh -p 2265 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no buildbot@localhost
ssh -p 2266 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no buildbot@localhost
```

Once logged in:

```
sudo yum -y update
sudo yum -y install patch tar libaio perl perl-Time-HiRes perl-DBI

# shutdown the VM
sudo shutdown -h now
```

VMs for MySQL upgrade testing

On the VM host server:

```
qemu-img create -b /kvm/vms/vm-fedora17-i386-serial.qcow2 -f qcow2 /kvm/vms/vm-fedora17-i386-
upgrade.qcow2
qemu-img create -b /kvm/vms/vm-fedora17-amd64-serial.qcow2 -f qcow2 /kvm/vms/vm-fedora17-amd64-
upgrade.qcow2
```

Boot the VMs with:

```
kvm -m 1024 -hda /kvm/vms/vm-fedora17-i386-upgrade.qcow2 -redir tcp:2265::22 -boot c -smp 2 -cpu qemu64 -
net nic,model=virtio -net user -nographic
kvm -m 1024 -hda /kvm/vms/vm-fedora17-amd64-upgrade.qcow2 -redir tcp:2266::22 -boot c -smp 2 -cpu qemu64
-net nic,model=virtio -net user -nographic
```

Login to the VMs:

```
ssh -p 2265 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no buildbot@localhost
ssh -p 2266 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no buildbot@localhost
```

Once logged in:

```
sudo yum -y update
sudo yum -y install tar mysql-server
sudo systemctl enable mysqld.service
sudo systemctl start mysqld.service
mysql -uroot -e "create database mytest; use mytest; create table t(a int primary key); insert into t
values (1); select * from t"

# shutdown the VM
sudo shutdown -h now
```

The MariaDB upgrade testing VMs were not built. Once we have MariaDB Fedora 17 RPMs, then I will attempt building this VM. For now, the placeholder text below is copied from the Buildbot Setup for Virtual Machines - CentOS 6.2 page.

VMs for MariaDB upgrade testing

```
for i in '/kvm/vms/vm-fedora17-amd64-serial.qcow2 2266 qemu64' '/kvm/vms/vm-fedora17-i386-serial.qcow2
2265 qemu64' ; do \
  set $i; \
  runvm --user=buildbot --logfile=kernel_$2.log --base-image=$1 --port=$2 --cpu=$3 "$(echo $1 | sed -e
's/serial/upgrade2/')" \
    'sudo yum -y update' \
    "= scp -P $2 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no /kvm/vms/MariaDB.repo
buildbot@localhost:/tmp/" \
    'sudo rpm --verbose --import http://downloads.mariadb.org/repo/RPM-GPG-KEY-MariaDB' \
    'sudo mv -vi /tmp/MariaDB.repo /etc/yum.repos.d/' \
    'sudo yum -y remove mysql-libs' \
    'sudo yum -y install MariaDB-server MariaDB-client MariaDB-test' \
    'sudo yum -y install cronie cronie-anacron crontabs.noarch postfix' \
    'sudo /etc/init.d/mysqld start' \
    'mysql -uroot -prootpass -e "create database mytest; use mytest; create table t(a int primary key);
insert into t values (1); select * from t"' \
    'sudo rm -v /etc/yum.repos.d/MariaDB.repo' \
    "= scp -P $2 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no /kvm/vms/MariaDB.local.repo

Buildbot Setup for Virtual Machines - Fedora 18

Base Install

```
qemu-img create -f qcow2 /kvm/vms/vm-fedora18-i386-serial.qcow2 10G
qemu-img create -f qcow2 /kvm/vms/vm-fedora18-amd64-serial.qcow2 10G
```

Start each VM booting from the server install iso one at a time and perform the following install steps:

```
kvm -m 2048 -hda /kvm/vms/vm-fedora18-i386-serial.qcow2 -cdrom /kvm/iso/fedora/Fedora-18-i386-DVD.iso -
redir tcp:2277::22 -boot d -smp 2 -cpu qemu64 -net nic,model=virtio -net user
kvm -m 2048 -hda /kvm/vms/vm-fedora18-amd64-serial.qcow2 -cdrom /kvm/iso/fedora/Fedora-18-x86_64-DVD.iso
-redir tcp:2278::22 -boot d -smp 2 -cpu qemu64 -net nic,model=virtio -net user
```

Once running you can connect to the VNC server from your local host with:

```
vncviewer -via ${remote-host} localhost
```

Replace ${remote-host} with the host the vm is running on.

Note: When you activate the install, vncviewer may disconnect with a complaint about the rect being too large. This is fine. The Fedora installer has just resized the vnc screen. Simply reconnect.

Install, picking default options mostly, with the following notes:

- Under “Network Configuration” set the hostnames to fedora18-amd64 and fedora18-i386
- Change “Software Selection” to “Minimal Install” (default is “Gnome Desktop”)
- For “Installation Destination” select the disk then click continue.
- do not check the encryption checkbox
- On “Installation Options” screen, expand the “Partition scheme configuration” box and select a “Partition type” of “Standard Partition”
- While installing, set the root password

When the install is finished, you will be prompted to reboot. Go ahead and do so, but it will fail. Kill the VM (after the reboot fails) and start it up again:

```
kvm -m 2048 -hda /kvm/vms/vm-fedora18-i386-serial.qcow2 -redir tcp:2277::22 -boot c -smp 2 -cpu qemu64 -
net nic,model=virtio -net user
kvm -m 2048 -hda /kvm/vms/vm-fedora18-amd64-serial.qcow2 -redir tcp:2278::22 -boot c -smp 2 -cpu qemu64 -
net nic,model=virtio -net user
```

Until a non-root user is installed you must connect as root. SSH is preferred, so that's what we'll do first. Login as root.

```
ssh -p 2277 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no -i ~/.ssh/buildbot.id_dsa
root@localhost
ssh -p 2278 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no -i ~/.ssh/buildbot.id_dsa
root@localhost
```

After logging in as root, install proper ssh and then create a local user:

```
adduser ${username}
usermod -a -G wheel ${username}
passwd ${username}
```

Enable password-less sudo and serial console:

```
visudo
# Uncomment the line "%wheel        ALL=(ALL)       NOPASSWD: ALL"
# Comment out this line:
# Defaults    requiretty
```

Still logged in as root, add to /boot/grub/menu.lst:

Editing /boot/grub/menu.lst:

```
sudo vi /etc/default/grub

# Add/edit these entries:
    GRUB_CMDLINE_LINUX_DEFAULT="console=tty0 console=ttyS0,115200n8"
    GRUB_TERMINAL="serial"
    GRUB_SERIAL_COMMAND="serial --unit=0 --speed=115200 --word=8 --parity=no --stop=1"

grub2-mkconfig -o /boot/grub2/grub.cfg
```

Logout as root, and then, from the VM host server:

Create a .ssh folder:

```
ssh -t -p 2277 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no -i ~/.ssh/buildbot.id_dsa
localhost "mkdir -v .ssh"
ssh -t -p 2278 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no -i ~/.ssh/buildbot.id_dsa
localhost "mkdir -v .ssh"
```

Copy over the authorized keys file:

```
scp -P 2277 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no /kvm/vms/authorized_keys
localhost:.ssh/
scp -P 2278 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no /kvm/vms/authorized_keys
localhost:.ssh/
```

Set permissions on the .ssh folder correctly:

```
ssh -t -p 2277 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no -i ~/.ssh/buildbot.id_dsa
localhost "chmod -R go-rwx .ssh"
ssh -t -p 2278 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no -i ~/.ssh/buildbot.id_dsa
localhost "chmod -R go-rwx .ssh"
```

Create the buildbot user:

```
ssh -p 2277 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no localhost 'chmod -R go-rwx .ssh;
sudo adduser buildbot; sudo usermod -a -G wheel buildbot; sudo mkdir ~buildbot/.ssh; sudo cp -vi
.ssh/authorized_keys ~buildbot/.ssh/; sudo chown -vR buildbot:buildbot ~buildbot/.ssh; sudo chmod -vR go-
rwx ~buildbot/.ssh'
ssh -p 2278 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no localhost 'chmod -R go-rwx .ssh;
sudo adduser buildbot; sudo usermod -a -G wheel buildbot; sudo mkdir ~buildbot/.ssh; sudo cp -vi
.ssh/authorized_keys ~buildbot/.ssh/; sudo chown -vR buildbot:buildbot ~buildbot/.ssh; sudo chmod -vR go-
rwx ~buildbot/.ssh'
```

su to the local buildbot user and ssh to the vm to put the key in known_hosts:

For i386:

```
sudo su - buildbot
ssh -p 2277 buildbot@localhost
# exit, then exit again
```

For amd64:

```
sudo su - buildbot
ssh -p 2278 buildbot@localhost
# exit, then exit again
```

Upload the ttyS0 file and put it where it goes:

```
scp -P 2277 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no /kvm/vms/ttyS0
buildbot@localhost:
scp -P 2278 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no /kvm/vms/ttyS0
buildbot@localhost:

ssh -p 2277 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no buildbot@localhost 'sudo mkdir -v
/etc/event.d;sudo mv -vi ttyS0 /etc/event.d/;'
ssh -p 2278 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no buildbot@localhost 'sudo mkdir -v
/etc/event.d;sudo mv -vi ttyS0 /etc/event.d/;'
```

Update the VM:

```
ssh -p 2277 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no buildbot@localhost
ssh -p 2278 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no buildbot@localhost
```

Once logged in:

```
sudo yum update
```

After updating, shut down the VM:

```
sudo shutdown -h now
```

VMs for building .rpms

```
for i in '/kvm/vms/vm-fedora18-i386-serial.qcow2 2277 qemu64' '/kvm/vms/vm-fedora18-amd64-serial.qcow2

Buildbot Setup for Virtual Machines - Fedora 19

Base Install

```
qemu-img create -f qcow2 /kvm/vms/vm-fedora19-i386-serial.qcow2 20G
qemu-img create -f qcow2 /kvm/vms/vm-fedora19-amd64-serial.qcow2 20G
```

Start each VM booting from the server install iso one at a time and perform the following install steps:

```
kvm -m 2048 -hda /kvm/vms/vm-fedora19-i386-serial.qcow2 -cdrom /ds413/iso/fedora/Fedora-19-i386-DVD.iso -
redir tcp:2289::22 -boot d -smp 2 -cpu qemu64 -net nic,model=virtio -net user
kvm -m 2048 -hda /kvm/vms/vm-fedora19-amd64-serial.qcow2 -cdrom /ds413/iso/fedora/Fedora-19-x86_64-
DVD.iso -redir tcp:2290::22 -boot d -smp 2 -cpu qemu64 -net nic,model=virtio -net user
```

Once running you can connect to the VNC server from your local host with:

```
vncviewer -via ${remote-host} localhost
```

Replace ${remote-host} with the host the vm is running on.

Note: When you activate the install, vncviewer may disconnect with a complaint about the rect being too large. This is fine. The Fedora installer has just resized the vnc screen. Simply reconnect.

Install, picking default options mostly, with the following notes:

- Under “Network Configuration” set the hostnames to fedora19-amd64 and fedora19-i386
- Change “Software Selection” to “Minimal Install” (default is “Gnome Desktop”)
- For “Installation Destination” select the disk then click continue.
- do not check the encryption checkbox
- On “Installation Options” screen, expand the “Partition scheme configuration” box and select a “Partition type” of “Standard Partition”
- While installing, set the root password and an initial user

When the install is finished, you will be prompted to reboot. Go ahead and do so, but it will fail. Kill the VM (after the reboot fails) and start it up again:

```
kvm -m 2048 -hda /kvm/vms/vm-fedora19-i386-serial.qcow2 -redir tcp:2289::22 -boot c -smp 2 -cpu qemu64 -
net nic,model=virtio -net user
kvm -m 2048 -hda /kvm/vms/vm-fedora19-amd64-serial.qcow2 -redir tcp:2290::22 -boot c -smp 2 -cpu qemu64 -
net nic,model=virtio -net user
```

Log in using the initial user created during the install:

```
ssh -p 2289 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no -i ~/.ssh/buildbot.id_dsa
localhost
ssh -p 2290 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no -i ~/.ssh/buildbot.id_dsa
localhost
```

After logging in, add the initial user to the “wheel” group.

```
usermod -a -G wheel ${username}
```

Enable password-less sudo for the “wheel” group and serial console sudo:

```
visudo
# Uncomment the line "%wheel        ALL=(ALL)       NOPASSWD: ALL"
# Comment out this line:
# Defaults    requiretty
```

Edit /boot/grub/menu.lst:

```
sudo vi /etc/default/grub

# Add/edit these entries:
    GRUB_CMDLINE_LINUX_DEFAULT="console=tty0 console=ttyS0,115200n8"
    GRUB_TERMINAL="serial"
    GRUB_SERIAL_COMMAND="serial --unit=0 --speed=115200 --word=8 --parity=no --stop=1"

grub2-mkconfig -o /boot/grub2/grub.cfg
```

Logout as root, and then, from the VM host server:

Create a .ssh folder:

```
ssh -t -p 2289 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no -i ~/.ssh/buildbot.id_dsa
localhost "mkdir -v .ssh"
ssh -t -p 2290 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no -i ~/.ssh/buildbot.id_dsa
localhost "mkdir -v .ssh"
```

Copy over the authorized keys file:

```
scp -P 2289 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no /kvm/vms/authorized_keys
localhost:.ssh/
scp -P 2290 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no /kvm/vms/authorized_keys
localhost:.ssh/
```

Set permissions on the .ssh folder correctly:

```
ssh -t -p 2289 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no -i ~/.ssh/buildbot.id_dsa
localhost "chmod -R go-rwx .ssh"
ssh -t -p 2290 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no -i ~/.ssh/buildbot.id_dsa
localhost "chmod -R go-rwx .ssh"
```

Create the buildbot user:

```
ssh -p 2289 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no localhost 'chmod -R go-rwx .ssh;
sudo adduser buildbot; sudo usermod -a -G wheel buildbot; sudo mkdir ~buildbot/.ssh; sudo cp -vi
.ssh/authorized_keys ~buildbot/.ssh/; sudo chown -vR buildbot:buildbot ~buildbot/.ssh; sudo chmod -vR go-
rwx ~buildbot/.ssh'
ssh -p 2290 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no localhost 'chmod -R go-rwx .ssh;
sudo adduser buildbot; sudo usermod -a -G wheel buildbot; sudo mkdir ~buildbot/.ssh; sudo cp -vi
.ssh/authorized_keys ~buildbot/.ssh/; sudo chown -vR buildbot:buildbot ~buildbot/.ssh; sudo chmod -vR go-
rwx ~buildbot/.ssh'
```

su to the local buildbot user and ssh to the vm to put the key in known_hosts:

For i386:

```
sudo su - buildbot
ssh -p 2289 buildbot@localhost
# exit, then exit again
```

For amd64:

```
sudo su - buildbot
ssh -p 2290 buildbot@localhost
# exit, then exit again
```

Upload the ttyS0 file and put it where it goes:

```
scp -P 2289 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no /kvm/vms/ttyS0
buildbot@localhost:
scp -P 2290 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no /kvm/vms/ttyS0
buildbot@localhost:

ssh -p 2289 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no buildbot@localhost 'sudo mkdir -v
/etc/event.d;sudo mv -vi ttyS0 /etc/event.d/;'
ssh -p 2290 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no buildbot@localhost 'sudo mkdir -v
/etc/event.d;sudo mv -vi ttyS0 /etc/event.d/;'
```

Update the VM:

```
ssh -p 2289 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no buildbot@localhost
ssh -p 2290 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no buildbot@localhost
```

Once logged in:

```
sudo yum update
```

Change selinux policy to `permissive`:

```
sudo vi /etc/selinux/config
# change:
SELINUX=enforcing
# to:
SELINUX=permissive
```

After updating, shut down the VM:

```
sudo shutdown -h now
```

VMs for building .rpms

```

Buildbot Setup for Virtual Machines - Fedora 20

Base Install

```
qemu-img create -f qcow2 /kvm/vms/vm-fedora20-i386-serial.qcow2 20G
qemu-img create -f qcow2 /kvm/vms/vm-fedora20-amd64-serial.qcow2 20G
```

Start each VM booting from the server install iso one at a time and perform the following install steps:

```
kvm -m 2048 -hda /kvm/vms/vm-fedora20-i386-serial.qcow2 -cdrom /ds413/iso/fedora/Fedora-20-i386-DVD.iso -
redir tcp:2291::22 -boot d -smp 2 -cpu qemu64 -net nic,model=virtio -net user
kvm -m 2048 -hda /kvm/vms/vm-fedora20-amd64-serial.qcow2 -cdrom /ds413/iso/fedora/Fedora-20-x86_64-
DVD.iso -redir tcp:2292::22 -boot d -smp 2 -cpu qemu64 -net nic,model=virtio -net user
```

Once running you can connect to the VNC server from your local host with:

```
vncviewer -via ${remote-host} localhost
```

Replace ${remote-host} with the host the vm is running on.

Note: When you activate the install, vncviewer may disconnect with a complaint about the rect being too large. This is fine. The Fedora installer has just resized the vnc screen. Simply reconnect.

Install, picking default options mostly, with the following notes:

- Set the language to English(US)
- Set the timezone to Etc/Greenwich Mean Time timezone
- Change “Software Selection” to “Minimal Install” (default is “Gnome Desktop”)
- Under “Network Configuration” set the hostnames to fedora20-amd64 and fedora20-i386
- For “Installation Destination” select the disk then click continue.
  - On “Installation Options” screen, select the “Partition scheme” drop-down menu and select “Standard Partition”. We do not want LVM.
  - do not check the encryption checkbox

- Select the “Begin installation” button to start the install
- While installing, set the root password and an initial user.
  - Be sure the initial user is an administrator

When the install is finished, you will be prompted to reboot. Go ahead and do so, but it will fail. Kill the VM after the reboot fails and start it up again with:

```
kvm -m 2048 -hda /kvm/vms/vm-fedora20-i386-serial.qcow2 -redir tcp:2291::22 -boot c -smp 2 -cpu qemu64 -
net nic,model=virtio -net user
kvm -m 2048 -hda /kvm/vms/vm-fedora20-amd64-serial.qcow2 -redir tcp:2292::22 -boot c -smp 2 -cpu qemu64 -
net nic,model=virtio -net user
```

Log in using the initial user created during the install:

```
ssh -p 2291 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no -i ~/.ssh/buildbot.id_dsa
localhost
ssh -p 2292 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no -i ~/.ssh/buildbot.id_dsa
localhost
```

After logging in, add the initial user to the “wheel” group.

```
sudo usermod -a -G wheel ${username}
```

Enable password-less sudo for the “wheel” group and serial console sudo:

```
sudo visudo
# Uncomment the line "%wheel        ALL=(ALL)       NOPASSWD: ALL"
# Comment out this line:
# Defaults    requiretty
```

Edit /boot/grub/menu.lst:

```
sudo vi /etc/default/grub

# Add/edit these entries:
GRUB_CMDLINE_LINUX_DEFAULT="console=tty0 console=ttyS0,115200n8"
GRUB_TERMINAL="serial"
GRUB_SERIAL_COMMAND="serial --unit=0 --speed=115200 --word=8 --parity=no --stop=1"

sudo grub2-mkconfig -o /boot/grub2/grub.cfg
```

Logout and then, from the VM host server:

Create a .ssh folder:

```
ssh -t -p 2291 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no -i ~/.ssh/buildbot.id_dsa
localhost "mkdir -v .ssh"
ssh -t -p 2292 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no -i ~/.ssh/buildbot.id_dsa
localhost "mkdir -v .ssh"
```

Copy over the authorized keys file:

```
scp -P 2291 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no /kvm/vms/authorized_keys
localhost:.ssh/
scp -P 2292 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no /kvm/vms/authorized_keys
localhost:.ssh/
```

Set permissions on the .ssh folder correctly:

```
ssh -t -p 2291 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no -i ~/.ssh/buildbot.id_dsa
localhost "chmod -vR go-rwx .ssh"
ssh -t -p 2292 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no -i ~/.ssh/buildbot.id_dsa
localhost "chmod -vR go-rwx .ssh"
```

Create the buildbot user:

```
ssh -t -p 2291 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no localhost 'chmod -vR go-rwx
.ssh; sudo adduser buildbot; sudo usermod -a -G wheel buildbot; sudo mkdir ~buildbot/.ssh; sudo cp -vi
.ssh/authorized_keys ~buildbot/.ssh/; sudo chown -vR buildbot:buildbot ~buildbot/.ssh; sudo chmod -vR go-
rwx ~buildbot/.ssh'
ssh -t -p 2292 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no localhost 'chmod -vR go-rwx
.ssh; sudo adduser buildbot; sudo usermod -a -G wheel buildbot; sudo mkdir ~buildbot/.ssh; sudo cp -vi
.ssh/authorized_keys ~buildbot/.ssh/; sudo chown -vR buildbot:buildbot ~buildbot/.ssh; sudo chmod -vR go-
rwx ~buildbot/.ssh'
```

su to the local buildbot user and ssh to the vm to put the key in known_hosts:

For i386:

```
sudo su - buildbot
ssh -p 2291 buildbot@localhost
# exit, then exit again
```

For amd64:

```
sudo su - buildbot
ssh -p 2292 buildbot@localhost
# exit, then exit again
```

Upload the ttyS0 file and put it where it goes:

```
scp -P 2291 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no /kvm/vms/ttyS0
buildbot@localhost:
scp -P 2292 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no /kvm/vms/ttyS0
buildbot@localhost:

ssh -t -p 2291 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no buildbot@localhost 'sudo mkdir
-v /etc/event.d;sudo mv -vi ttyS0 /etc/event.d/;'
ssh -t -p 2292 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no buildbot@localhost 'sudo mkdir
-v /etc/event.d;sudo mv -vi ttyS0 /etc/event.d/;'
```

Update the VM:

```
ssh -t -p 2291 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no buildbot@localhost
ssh -t -p 2292 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no buildbot@localhost
```

Once logged in:

```
sudo yum -y update
```

Change selinux policy to `permissive`:

```
sudo sed -i 's/SELINUX=enforcing/SELINUX=permissive/' /etc/selinux/config
```

After updating, exit, then shut down the VM:

```
exit
```

```
ssh -t -p 2291 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no buildbot@localhost 'sudo
shutdown -h now;exit'
ssh -t -p 2292 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no buildbot@localhost 'sudo
shutdown -h now;exit'
```

VMs for building .rpms

```
for i in '/kvm/vms/vm-fedora20-i386-serial.qcow2 2291 qemu64' '/kvm/vms/vm-fedora20-amd64-serial.qcow2

Buildbot Setup for Virtual Machines - Red Hat 6 x86

The following steps were used to create a Red Hat 6 x86 build slave.

Initial Setup

```
cd vms
qemu-img create -f qcow2 vm-rhel6-x86-base.qcow2 8G
kvm -m 1024 -hda vm-rhel6-x86-base.qcow2 -cdrom ../iso/red-hat/rhel-server-6.0-i386-dvd.iso -redir
'tcp:22275::22' -boot d -smp 2 -cpu qemu32,-nx -net nic,model=virtio -net user
```

When the VM boots. Go through the prompts.

Re-initialize the drive, when prompted.

Set the Hostname to “rhel6-x86”.

Configure Network, set eth0 to “Connect Automatically”

Set the root password.

Set partitioning type to: Use All Space

Don’t encrypt the partitions (just adds overhead).

Select “Write Changes to Disk” on the popup that appears.

Set the software set to “Virtual Host”.

After clicking next on the install-type page, the installation will finally start.

After installation completes, click reboot. Then shutdown the VM.

Serial Console Setup

```
cd vms
qemu-img create -b vm-rhel6-x86-base.qcow2 -f qcow2 vm-rhel6-x86-serial.qcow2
kvm -m 1024 -hda vm-rhel6-x86-serial.qcow2 -redir 'tcp:22275::22' -boot c -smp 2 -cpu qemu32,-nx -net
nic,model=virtio -net user
```

Login as root.

Add to /boot/grub/menu.lst:

```
serial --unit=0 --speed=115200 --word=8 --parity=no --stop=1
terminal --timeout=3 serial console
```

also add in menu.lst to kernel line (after removing ‘quiet’):

```
console=tty0 console=ttyS0,115200n8
```

Add login prompt on serial console:

```
cat >>/etc/inittab <<END

# Serial console.
S0:2345:respawn:/sbin/agetty -h -L ttyS0 19200 vt100
END
```

Create buildbot account

With the network up and running, it’s time to add a user so that we don’t have to login as root all the time.

```
useradd buildbot
# Password is disabled by default in Centos5.
usermod -a -G wheel buildbot
visudo
# Uncomment the line "%wheel        ALL=(ALL)       NOPASSWD: ALL"
# Comment out this line:
# Defaults    requiretty

# Put in public ssh key for own account and host buildbot account.
# Note that Centos5 seems to require .ssh/authorized_keys chmod go-rwx.
su - buildbot
mkdir .ssh
chmod go-rwx .ssh

# scp the key from the vm host over to .ssh/authorized_keys

chmod go-rwx .ssh/authorized_keys
```

Now logout and then ssh to the VM as the buildbot user. On my local box I added the following to my /.ssh/config file to make logging in easier:

```
Host rhel6-x86
HostName localhost
  User buildbot
  IdentityFile ~/.ssh/id_rsa
  Port 2225
```

With the above in place I can simply type:

```
ssh rhel6-x86
```

…to connect to the vm.

RHN and Updates

Register the system with RHN:

```
sudo rhn_register
```

Choose defaults when registering. After the process is complete:

```
sudo yum update
```

The first time you update you'll be prompted to import some GPG keys from Red
Hat. The updating process may take a while, depending on the number of updates and the speed of your Internet connection.

After updating shutdown so we can make more copies.

```
sudo shutdown -h now
```

Image for RPM Build

```
qemu-img create -b vm-rhel6-x86-serial.qcow2 -f qcow2 vm-rhel6-x86-build.qcow2
kvm -m 1024 -hda vm-rhel6-x86-build.qcow2 -redir 'tcp:22275::22' -boot c -smp 2 -cpu qemu32,-nx -net
nic,model=virtio -net user -nographic
```

Wait for the system to boot.

Install compilers etc:

```
sudo yum groupinstall "Development Tools"
sudo yum install libaio-devel openssl-devel
```

If the "Development Tools" group is not available, the following lines will install the packages from it:

```
# Mandatory Packages:
sudo yum install autoconf automake binutils bison flex gcc gcc-c++ gettext
sudo yum install libtool make patch pkgconfig redhat-rpm-config rpm-build

# Default Packages:
sudo yum install byacc cscope ctags cvs diffstat doxygen elfutils gcc-gfortran
sudo yum install git indent intltool patchutils rcs subversion swig systemtap

# Optional Packages:
sudo yum install ElectricFence ant babel bzr chrpath cmake compat-gcc-34
sudo yum install compat-gcc-34-c++ compat-gcc-34-g77 dejagnu expect gcc-gnat
sudo yum install gcc-java gcc-objc gcc-objc++ imake jpackage-utils libstdc++-docs
sudo yum install mercurial mod_dav_svn nasm perltidy python-docs rpmdevtools
sudo yum install rpmlint systemtap-sdt-devel systemtap-server
```

Other packages to install:

```
sudo yum install gperf readline-devel ncurses-devel zlib-devel perl perl\(DBI\)
```

Create rpm directories and download 5.0 rpm for shared-compat:

```
sudo mkdir -vp /usr/src/redhat/SOURCES /usr/src/redhat/SPECS /usr/src/redhat/RPMS /usr/src/redhat/SRPMS
sudo mkdir -vp /srv/shared/yum/CentOS/5/i386/RPMS/
cd /srv/shared/yum/CentOS/5/i386/RPMS/
sudo wget http://mirror.ourdelta.org/yum/CentOS/5/i386/RPMS/MySQL-OurDelta-shared-5.0.87.d10-
65.el5.i386.rpm
```

Image for install/test

```
qemu-img create -b vm-rhel6-x86-serial.qcow2 -f qcow2 vm-rhel6-x86-install.qcow2
kvm -m 1024 -hda vm-rhel6-x86-install.qcow2 -redir 'tcp:22275::22' -boot c -smp 2 -cpu qemu32,-nx -net
nic,model=virtio -net user -nographic
```

Install extra dependencies:

```
sudo yum install perl perl\(DBI\)
```

Buildbot Setup for Virtual Machines - Ubuntu 10.04 (alpha), i386 and amd64

Base Install

```
qemu-img create -f qcow2 vm-lucid-amd64-serial.qcow2 8G
kvm -m 1024 -hda vm-lucid-amd64-serial.qcow2 -cdrom /kvm/lucid-server-amd64.iso -redir tcp:2238::22 -boot
d -smp 2 -cpu qemu64 -net nic,model=virtio -net user
# Install, picking default options mostly, only adding openssh server.
kvm -m 1024 -hda vm-lucid-amd64-serial.qcow2 -cdrom /kvm/lucid-server-amd64.iso -redir tcp:2238::22 -boot
c -smp 2 -cpu qemu64 -net nic,model=virtio -net user -nographic
ssh -p 2238 localhost
# edit /boot/grub/menu.lst and visudo, see below
ssh -t -p 2238 localhost "mkdir .ssh; sudo addgroup $USER sudo"
scp -P 2238 authorized_keys localhost:.ssh/
echo $'Buildbot\n\n\n\n\ny' | ssh -p 2238 localhost 'chmod -R go-rwx .ssh; sudo adduser --disabled-
password buildbot; sudo addgroup buildbot sudo; sudo mkdir ~buildbot/.ssh; sudo cp .ssh/authorized_keys
~buildbot/.ssh/; sudo chown -R buildbot:buildbot ~buildbot/.ssh; sudo chmod -R go-rwx ~buildbot/.ssh'
scp -P 2238 ttyS0.conf buildbot@localhost:
ssh -p 2238 buildbot@localhost 'sudo cp ttyS0.conf /etc/init/; rm ttyS0.conf; sudo shutdown -h now'
```

```
qemu-img create -f qcow2 vm-lucid-i386-serial.qcow2 8G
kvm -m 1024 -hda vm-lucid-i386-serial.qcow2 -cdrom /kvm/lucid-server-i386.iso -redir tcp:2239::22 -boot d
-smp 2 -cpu qemu32,-nx -net nic,model=virtio -net user
# Install, picking default options mostly, only adding openssh server.
kvm -m 1024 -hda vm-lucid-i386-serial.qcow2 -cdrom /kvm/lucid-server-i386.iso -redir tcp:2239::22 -boot c
-smp 2 -cpu qemu32,-nx -net nic,model=virtio -net user -nographic
ssh -p 2239 localhost
# edit /boot/grub/menu.lst and visudo, see below
ssh -t -p 2239 localhost "mkdir .ssh; sudo addgroup $USER sudo"
scp -P 2239 authorized_keys localhost:.ssh/
echo $'Buildbot\n\n\n\n\ny' | ssh -p 2239 localhost 'chmod -R go-rwx .ssh; sudo adduser --disabled-
password buildbot; sudo addgroup buildbot sudo; sudo mkdir ~buildbot/.ssh; sudo cp .ssh/authorized_keys
~buildbot/.ssh/; sudo chown -R buildbot:buildbot ~buildbot/.ssh; sudo chmod -R go-rwx ~buildbot/.ssh'
scp -P 2239 ttyS0.conf buildbot@localhost:
ssh -p 2239 buildbot@localhost 'sudo cp ttyS0.conf /etc/init/; rm ttyS0.conf; sudo shutdown -h now'
```

Enabling passwordless sudo:

```
sudo VISUAL=vi visudo
# uncomment `%sudo ALL=NOPASSWD: ALL' line in `visudo`, and move to end.
```

Editing /boot/grub/menu.lst:

```
sudo vi /etc/default/grub

# Add/edit these entries:
    GRUB_CMDLINE_LINUX_DEFAULT="console=tty0 console=ttyS0,115200n8"
    GRUB_TERMINAL="serial"
    GRUB_SERIAL_COMMAND="serial --unit=0 --speed=115200 --word=8 --parity=no --stop=1"

sudo update-grub
```

VMs for building .debs

```
for i in 'vm-lucid-amd64-serial.qcow2 2238 qemu64' 'vm-lucid-i386-serial.qcow2 2239 qemu32,-nx' ; do \
  set $i; \
  runvm --logfile=kernel_$2.log --base-image=$1 --port=$2 --cpu=$3 "$(echo $1 | sed -e
's/serial/build/')" \
    "sudo DEBIAN_FRONTEND=noninteractive apt-get update" \
    "sudo DEBIAN_FRONTEND=noninteractive apt-get -y build-dep mysql-server-5.1" \
    "sudo DEBIAN_FRONTEND=noninteractive apt-get install -y devscripts hardening-wrapper fakeroot doxygen
texlive-latex-base ghostscript libevent-dev libssl-dev zlib1g-dev libreadline5-dev" ; \
done
```

VMs for install testing.

See above for how to obtain my.seed and sources.append.

```
cat >sources.append <<END
deb file:///home/buildbot/buildbot/debs binary/
deb-src file:///home/buildbot/buildbot/debs source/
END

for i in 'vm-lucid-amd64-serial.qcow2 2238 qemu64' 'vm-lucid-i386-serial.qcow2 2239 qemu32,-nx' ; do \
  set $i; \
  runvm --logfile=kernel_$2.log --base-image=$1 --port=$2 --cpu=$3 "$(echo $1 | sed -e
's/serial/install/')" \
    "sudo DEBIAN_FRONTEND=noninteractive apt-get update" \
    "sudo DEBIAN_FRONTEND=noninteractive apt-get install -y debconf-utils" \
    "= scp -P $2 my.seed sources.append buildbot@localhost:/tmp/" \
    "sudo debconf-set-selections /tmp/my.seed" \
    "sudo sh -c 'cat /tmp/sources.append >> /etc/apt/sources.list'"; \
done
```

VMs for upgrade testing

```
for i in 'vm-lucid-amd64-install.qcow2 2238 qemu64' 'vm-lucid-i386-install.qcow2 2239 qemu32,-nx' ; do \
  set $i; \
  runvm --logfile=kernel_$2.log --base-image=$1 --port=$2 --cpu=$3 "$(echo $1 | sed -e
's/install/upgrade/')" \
    'sudo DEBIAN_FRONTEND=noninteractive apt-get install -y mysql-server-5.1' \
    'mysql -uroot -prootpass -e "create database mytest; use mytest; create table t(a int primary key);
insert into t values (1); select * from t"' ;\
done
```

insert into t values (1); select * from t"' ;\
done
```

VMs for MariaDB upgrade testing

The steps below are based on the Natty steps on Installing VM images for testing .deb upgrade between versions.

64-bit Ubuntu oneiric:

```
qemu-img create -b vm-oneiric-amd64-install.qcow2 -f qcow2 vm-oneiric-amd64-upgrade2.qcow2
kvm -m 512 -hda vm-oneiric-amd64-upgrade2.qcow2 -redir 'tcp:2200::22' -boot c -smp 1 -cpu qemu64 -net
nic,model=virtio -net user -nographic
ssh -p 2200 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no buildbot@localhost

sudo sh -c 'cat > /etc/apt/sources.list.d/tmp.list'
deb http://ftp.osuosl.org/pub/mariadb/repo/5.2/ubuntu natty main
deb-src http://ftp.osuosl.org/pub/mariadb/repo/5.2/ubuntu natty main

sudo apt-key adv --recv-keys --keyserver keyserver.ubuntu.com 1BB943DB
sudo apt-get update
sudo DEBIAN_FRONTEND=noninteractive apt-get install -y --allow-unauthenticated mariadb-server mariadb-
test libmariadbclient-dev
sudo rm /etc/apparmor.d/usr.sbin.mysqld
sudo /etc/init.d/apparmor restart
sudo apt-get -f install
mysql -uroot -prootpass -e "create database mytest; use mytest; create table t(a int primary key); insert
into t values (1); select * from t"
sudo rm /etc/apt/sources.list.d/tmp.list
sudo apt-get update
sudo DEBIAN_FRONTEND=noninteractive apt-get upgrade -y
sudo shutdown -h now
```

32-bit Ubuntu oneiric:

```
qemu-img create -b vm-oneiric-i386-install.qcow2 -f qcow2 vm-oneiric-i386-upgrade2.qcow2
kvm -m 512 -hda vm-oneiric-i386-upgrade2.qcow2 -redir 'tcp:2200::22' -boot c -smp 1 -cpu qemu64 -net
nic,model=virtio -net user -nographic
ssh -p 2200 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no buildbot@localhost

sudo sh -c 'cat > /etc/apt/sources.list.d/tmp.list'
deb http://ftp.osuosl.org/pub/mariadb/repo/5.2/ubuntu natty main
deb-src http://ftp.osuosl.org/pub/mariadb/repo/5.2/ubuntu natty main

sudo apt-key adv --recv-keys --keyserver keyserver.ubuntu.com 1BB943DB
sudo apt-get update
sudo DEBIAN_FRONTEND=noninteractive apt-get install -y --allow-unauthenticated mariadb-server mariadb-
test libmariadbclient-dev
sudo rm /etc/apparmor.d/usr.sbin.mysqld
sudo /etc/init.d/apparmor restart
sudo apt-get -f install
mysql -uroot -prootpass -e "create database mytest; use mytest; create table t(a int primary key); insert
into t values (1); select * from t"
sudo rm /etc/apt/sources.list.d/tmp.list
sudo apt-get update
sudo DEBIAN_FRONTEND=noninteractive apt-get upgrade -y
sudo shutdown -h now
```

This page is licensed: CC BY-SA / Gnu FDL

Buildbot Setup for Virtual Machines - Ubuntu 12.04 “precise”

Base Install

```
qemu-img create -f qcow2 /kvm/vms/vm-precise-amd64-serial.qcow2 8G
qemu-img create -f qcow2 /kvm/vms/vm-precise-i386-serial.qcow2 8G
```

Start each VM booting from the server install iso one at a time and perform the following install steps:

```
kvm -m 1024 -hda /kvm/vms/vm-precise-amd64-serial.qcow2 -cdrom /kvm/iso/ubuntu/ubuntu-12.04-server-
amd64.iso -redir tcp:22255::22 -boot d -smp 2 -cpu qemu64 -net nic,model=virtio -net user
kvm -m 1024 -hda /kvm/vms/vm-precise-i386-serial.qcow2 -cdrom /kvm/iso/ubuntu/ubuntu-12.04-server-
i386.iso -redir tcp:22256::22 -boot d -smp 2 -cpu qemu32,-nx -net nic,model=virtio -net user
```

Once running you can connect to the VNC server from your local host with:

```
vncviewer -via ${remote-host} localhost
```

Replace ${remote-host} with the host the vm is running on.

Note: When you activate the install, vncviewer may disconnect with a complaint about the rect being too large. This is fine. Ubuntu has just resized the vnc screen. Simply reconnect.

Install, picking default options mostly, with the following notes:

- Set the hostname to ubuntu-precise
- When partitioning disks, choose “Guided - use entire disk” (we do not want LVM)
- No automatic updates
- Choose software to install: OpenSSH server

Now that the VM is installed, it’s time to configure it.
If you have the memory you can do the following simultaneously:

```
kvm -m 1024 -hda /kvm/vms/vm-precise-amd64-serial.qcow2 -cdrom /kvm/iso/ubuntu/ubuntu-12.04-server-amd64.iso -redir tcp:22255::22 -boot c -smp 2 -cpu qemu64 -net nic,model=virtio -net user -nographic
kvm -m 1024 -hda /kvm/vms/vm-precise-i386-serial.qcow2 -cdrom /kvm/iso/ubuntu/ubuntu-12.04-server-i386.iso -redir tcp:22256::22 -boot c -smp 2 -cpu qemu64 -net nic,model=virtio -net user -nographic

ssh -p 22255 localhost
# edit /boot/grub/menu.lst and visudo, see below

    'mysql -uroot -prootpass -e "create database mytest; use mytest; create table t(a int primary key);
insert into t values (1); select * from t"' ;\
done
```

VMs for MariaDB upgrade testing

The steps below are based on the Natty steps on Installing VM images for testing .deb upgrade between versions.

64-bit Ubuntu precise:

```
qemu-img create -b vm-precise-amd64-install.qcow2 -f qcow2 vm-precise-amd64-upgrade2.qcow2
kvm -m 512 -hda vm-precise-amd64-upgrade2.qcow2 -redir 'tcp:22200::22' -boot c -smp 1 -cpu qemu64 -net
nic,model=virtio -net user -nographic
ssh -p 22200 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no buildbot@localhost

sudo sh -c 'cat > /etc/apt/sources.list.d/tmp.list'
deb http://ftp.osuosl.org/pub/mariadb/repo/5.5/ubuntu oneiric main
deb-src http://ftp.osuosl.org/pub/mariadb/repo/5.5/ubuntu oneiric main

sudo apt-key adv --recv-keys --keyserver keyserver.ubuntu.com 1BB943DB
sudo apt-get update
sudo DEBIAN_FRONTEND=noninteractive apt-get install -y --allow-unauthenticated mariadb-server mariadb-
test libmariadbclient-dev
sudo apt-get -f install
mysql -uroot -prootpass -e "create database mytest; use mytest; create table t(a int primary key); insert
into t values (1); select * from t"
sudo rm /etc/apt/sources.list.d/tmp.list
sudo apt-get update
sudo DEBIAN_FRONTEND=noninteractive apt-get install -y libaio1
sudo DEBIAN_FRONTEND=noninteractive apt-get upgrade -y
sudo shutdown -h now
```

32-bit Ubuntu precise:

```
qemu-img create -b vm-precise-i386-install.qcow2 -f qcow2 vm-precise-i386-upgrade2.qcow2
kvm -m 512 -hda vm-precise-i386-upgrade2.qcow2 -redir 'tcp:22200::22' -boot c -smp 1 -cpu qemu64 -net
nic,model=virtio -net user -nographic
ssh -p 22200 -o UserKnownHostsFile=/dev/null -o StrictHostKeyChecking=no buildbot@localhost

sudo sh -c 'cat > /etc/apt/sources.list.d/tmp.list'
deb http://ftp.osuosl.org/pub/mariadb/repo/5.5/ubuntu oneiric main
deb-src http://ftp.osuosl.org/pub/mariadb/repo/5.5/ubuntu oneiric main

sudo apt-key adv --recv-keys --keyserver keyserver.ubuntu.com 1BB943DB
sudo apt-get update
sudo DEBIAN_FRONTEND=noninteractive apt-get install -y --allow-unauthenticated mariadb-server mariadb-
test libmariadbclient-dev
sudo apt-get -f install
mysql -uroot -prootpass -e "create database mytest; use mytest; create table t(a int primary key); insert
into t values (1); select * from t"
sudo rm /etc/apt/sources.list.d/tmp.list
sudo apt-get update
sudo DEBIAN_FRONTEND=noninteractive apt-get install -y libaio1
sudo DEBIAN_FRONTEND=noninteractive apt-get upgrade -y
sudo shutdown -h now
```

Buildbot Setup for Virtual Machines - Ubuntu 12.10 “quantal”

Base Install

```
qemu-img create -f qcow2 /kvm/vms/vm-quantal-amd64-serial.qcow2 10G
qemu-img create -f qcow2 /kvm/vms/vm-quantal-i386-serial.qcow2 10G
```

Start each VM booting from the server install iso one at a time and perform the following install steps:

```
kvm -m 2048 -hda /kvm/vms/vm-quantal-amd64-serial.qcow2 -cdrom /kvm/iso/ubuntu/ubuntu-12.10-server-
amd64.iso -boot d -smp 2 -cpu qemu64 -net nic,model=virtio -net user,hostfwd=tcp:127.0.0.1:2275-:22
kvm -m 2048 -hda /kvm/vms/vm-quantal-i386-serial.qcow2 -cdrom /kvm/iso/ubuntu/ubuntu-12.10-server-
i386.iso -boot d -smp 2 -cpu qemu64 -net nic,model=virtio -net user,hostfwd=tcp:127.0.0.1:2276-:22
```

Once running you can connect to the VNC server from your local host with:

```
vncviewer -via ${remote-host} localhost
```

Replace ${remote-host} with the host the vm is running on.

Note: When you activate the install, vncviewer may disconnect with a complaint about the rect being too large. This is fine. Ubuntu has just resized the vnc screen. Simply reconnect.

Install, picking default options mostly, with the following notes:

- Set the hostname to ubuntu-quantal-amd64 or ubuntu-quantal-i386
- When partitioning disks, choose “Guided - use entire disk” (we do not want LVM)
- No automatic updates
- Choose software to install: OpenSSH server

Now that the VM is installed, it’s time to configure it.
If you have the memory you can do the following simultaneously:

```
kvm -m 2048 -hda /kvm/vms/vm-quantal-amd64-serial.qcow2 -cdrom /kvm/iso/ubuntu/ubuntu-12.10-server-amd64.iso -boot c -smp 2 -cpu qemu64 -net nic,model=virtio -net user,hostfwd=tcp:127.0.0.1:2275-:22 -nographic
kvm -m 2048 -hda /kvm/vms/vm-quantal-i386-serial.qcow2 -cdrom /kvm/iso/ubuntu/ubuntu-12.10-server-i386.iso -boot c -smp 2 -cpu qemu64 -net nic,model=virtio -net user,hostfwd=tcp:127.0.0.1:2276-:22 -nographic

ssh -p 2275 localhost
# edit /boot/grub/menu.lst and visudo, see below

ssh -p 2276 localhost
# edit /boot/grub/menu.lst and visudo, see below

done
```

Add Key to known_hosts

Do the following on each kvm host server (terrier, terrier2, i7, etc…) to add the VMs to known_hosts.

```
# quantal-amd64
cp -avi /kvm/vms/vm-quantal-amd64-install.qcow2 /kvm/vms/vm-quantal-amd64-test.qcow2
kvm -m 1024 -hda /kvm/vms/vm-quantal-amd64-test.qcow2 -redir tcp:2275::22 -boot c -smp 2 -cpu qemu64 -net
nic,model=virtio -net user -nographic
sudo su - buildbot
ssh -p 2275 buildbot@localhost sudo shutdown -h now
# answer "yes" when prompted
exit # the buildbot user
rm -v /kvm/vms/vm-quantal-amd64-test.qcow2

# quantal-i386
cp -avi /kvm/vms/vm-quantal-i386-install.qcow2 /kvm/vms/vm-quantal-i386-test.qcow2
kvm -m 1024 -hda /kvm/vms/vm-quantal-i386-test.qcow2 -redir tcp:2276::22 -boot c -smp 2 -cpu qemu64 -net
nic,model=virtio -net user -nographic
sudo su - buildbot
ssh -p 2276 buildbot@localhost sudo shutdown -h now
# answer "yes" when prompted
exit # the buildbot user
rm -v /kvm/vms/vm-quantal-i386-test.qcow2
```

Buildbot Setup for Virtual Machines - Ubuntu 13.04 “raring”

Base Install

```
qemu-img create -f qcow2 /kvm/vms/vm-raring-amd64-serial.qcow2 15G
qemu-img create -f qcow2 /kvm/vms/vm-raring-i386-serial.qcow2 15G
```

Start each VM booting from the server install iso one at a time and perform the following install steps:

```
kvm -m 2048 -hda /kvm/vms/vm-raring-amd64-serial.qcow2 -cdrom /kvm/iso/ubuntu/ubuntu-13.04-server-
amd64.iso -boot d -smp 2 -cpu qemu64 -net nic,model=virtio -net user,hostfwd=tcp:127.0.0.1:2279-:22
kvm -m 2048 -hda /kvm/vms/vm-raring-i386-serial.qcow2 -cdrom /kvm/iso/ubuntu/ubuntu-13.04-server-i386.iso
-boot d -smp 2 -cpu qemu64 -net nic,model=virtio -net user,hostfwd=tcp:127.0.0.1:2280-:22
```

Once running you can connect to the VNC server from your local host with:

```
vncviewer -via ${remote-host} localhost
```

Replace ${remote-host} with the host the vm is running on.

Note: When you activate the install, vncviewer may disconnect with a complaint about the rect being too large. This is fine. Ubuntu has just resized the vnc screen. Simply reconnect.

Install, picking default options mostly, with the following notes:

- Set the hostname to ubuntu-raring-amd64 or ubuntu-raring-i386
- When partitioning disks, choose “Guided - use entire disk” (we do not want LVM)
- No automatic updates
- Choose software to install: OpenSSH server

Now that the VM is installed, it’s time to configure it.

    "sudo debconf-set-selections /tmp/my55.seed" \
    "sudo sh -c 'cat /tmp/sources.append >> /etc/apt/sources.list'" \
    'sudo DEBIAN_FRONTEND=noninteractive apt-get install -y mysql-server-5.5' \
    'mysql -uroot -prootpass -e "create database mytest; use mytest; create table t(a int primary key);
insert into t values (1); select * from t"' ;\
done
```

VMs for MariaDB upgrade testing

The steps below are based on the Natty steps on Installing VM images for testing .deb upgrade between versions.

```
for i in '/kvm/vms/vm-raring-amd64-serial.qcow2 2279 qemu64' '/kvm/vms/vm-raring-i386-serial.qcow2 2280
qemu64' ; do \
  set $i; \
  runvm --user=buildbot --logfile=kernel_$2.log --base-image=$1 --port=$2 --cpu=$3 "$(echo $1 | sed -e
's/serial/upgrade2/')" \
    "= scp -P $2 /kvm/vms/my55.seed /kvm/vms/sources.append buildbot@localhost:/tmp/" \
    "= scp -P $2 /kvm/vms/mariadb-raring.list buildbot@localhost:/tmp/tmp.list" \
    "sudo debconf-set-selections /tmp/my55.seed" \
    'sudo mv -vi /tmp/tmp.list /etc/apt/sources.list.d/' \
    'sudo apt-key adv --recv-keys --keyserver pgp.mit.edu 0xcbcb082a1bb943db' \
    "sudo DEBIAN_FRONTEND=noninteractive apt-get update" \
    'sudo DEBIAN_FRONTEND=noninteractive apt-get install -y mariadb-server mariadb-server-5.5 mariadb-
client mariadb-client-5.5 mariadb-test libmariadbclient-dev mysql-common=5.5.30-mariadb1~quantal
libmysqlclient18=5.5.30-mariadb1~quantal' \
    'mysql -uroot -prootpass -e "create database mytest; use mytest; create table t(a int primary key);
insert into t values (1); select * from t"' \
    'sudo rm -v /etc/apt/sources.list.d/tmp.list' \
    'sudo DEBIAN_FRONTEND=noninteractive apt-get update' \
    "sudo sh -c 'cat /tmp/sources.append >> /etc/apt/sources.list'" \
    'sudo DEBIAN_FRONTEND=noninteractive apt-get install -y patch libaio1 debconf-utils' \
    'sudo DEBIAN_FRONTEND=noninteractive apt-get upgrade -y'; \
done
```

Add Key to known_hosts

Do the following on each kvm host server (terrier, terrier2, i7, etc…) to add the VMs to known_hosts.

```
# raring-amd64
cp -avi /kvm/vms/vm-raring-amd64-install.qcow2 /kvm/vms/vm-raring-amd64-test.qcow2
kvm -m 1024 -hda /kvm/vms/vm-raring-amd64-test.qcow2 -redir tcp:2279::22 -boot c -smp 2 -cpu qemu64 -net
nic,model=virtio -net user -nographic
sudo su - buildbot
ssh -p 2279 buildbot@localhost sudo shutdown -h now
# answer "yes" when prompted
exit # the buildbot user
rm -v /kvm/vms/vm-raring-amd64-test.qcow2

# raring-i386
cp -avi /kvm/vms/vm-raring-i386-install.qcow2 /kvm/vms/vm-raring-i386-test.qcow2
kvm -m 1024 -hda /kvm/vms/vm-raring-i386-test.qcow2 -redir tcp:2280::22 -boot c -smp 2 -cpu qemu64 -net
nic,model=virtio -net user -nographic
sudo su - buildbot
ssh -p 2280 buildbot@localhost sudo shutdown -h now
# answer "yes" when prompted
exit # the buildbot user
rm -v /kvm/vms/vm-raring-i386-test.qcow2
```

Buildbot Setup for Virtual Machines - Ubuntu 13.10 “saucy”

Base Install

```
qemu-img create -f qcow2 /kvm/vms/vm-saucy-amd64-serial.qcow2 20G
qemu-img create -f qcow2 /kvm/vms/vm-saucy-i386-serial.qcow2 20G
```

Start each VM booting from the server install iso one at a time and perform the following install steps:

```
kvm -m 2048 -hda /kvm/vms/vm-saucy-amd64-serial.qcow2 -cdrom /kvm/iso/ubuntu/ubuntu-13.10-server-
amd64.iso -boot d -smp 2 -cpu qemu64 -net nic,model=virtio -net user,hostfwd=tcp:127.0.0.1:2287-:22
kvm -m 2048 -hda /kvm/vms/vm-saucy-i386-serial.qcow2 -cdrom /kvm/iso/ubuntu/ubuntu-13.10-server-i386.iso
-boot d -smp 2 -cpu qemu64 -net nic,model=virtio -net user,hostfwd=tcp:127.0.0.1:2288-:22
```

Once running you can connect to the VNC server from your local host with:

```
vncviewer -via ${remote_host} localhost
```

Replace ${remote-host} with the host the vm is running on.

Note: When you activate the install, vncviewer may disconnect with a complaint about the rect being too large. This is fine. Ubuntu has just resized the vnc screen. Simply reconnect.

Install, picking default options mostly, with the following notes:

- Set the hostname to ubuntu-saucy-amd64 or ubuntu-saucy-i386
- do not encrypt the home directory
- When partitioning disks, choose “Guided - use entire disk” (we do not want LVM)
- No automatic updates
- Choose software to install: OpenSSH server

Now that the VM is installed, it’s time to configure it.
If you have the memory you can do the following simultaneously:

```
kvm -m 2048 -hda /kvm/vms/vm-saucy-amd64-serial.qcow2 -cdrom /kvm/iso/ubuntu/ubuntu-13.10-server-amd64.iso -boot c -smp 2 -cpu qemu64 -net nic,model=virtio -net user,hostfwd=tcp:127.0.0.1:2287-:22 -nographic
kvm -m 2048 -hda /kvm/vms/vm-saucy-i386-serial.qcow2 -cdrom /kvm/iso/ubuntu/ubuntu-13.10-server-i386.iso -boot c -smp 2 -cpu qemu64 -net nic,model=virtio -net user,hostfwd=tcp:127.0.0.1:2288-:22 -nographic

ssh -p 2287 localhost
sudo update-alternatives --config editor
# edit /boot/grub/menu.lst and visudo, see below

ssh -p 2288 localhost
sudo update-alternatives --config editor
# edit /boot/grub/menu.lst and visudo, see below

ssh -t -p 2287 localhost "mkdir -v .ssh; sudo addgroup $USER sudo"
ssh -t -p 2288 localhost "mkdir -v .ssh; sudo addgroup $USER sudo"

scp -P 2287 /kvm/vms/authorized_keys localhost:.ssh/
scp -P 2288 /kvm/vms/authorized_keys localhost:.ssh/

echo $'Buildbot\n\n\n\n\ny' | ssh -p 2287 localhost 'chmod -vR go-rwx .ssh; sudo adduser --disabled-password buildbot; sudo addgroup buildbot sudo; sudo mkdir -v ~buildbot/.ssh; sudo cp -vi .ssh/authorized_keys ~buildbot/.ssh/; sudo chown -vR buildbot:buildbot ~buildbot/.ssh; sudo chmod -vR go-rwx ~buildbot/.ssh'
echo $'Buildbot\n\n\n\n\ny' | ssh -p 2288 localhost 'chmod -vR go-rwx .ssh; sudo adduser --disabled-password buildbot; sudo addgroup buildbot sudo; sudo mkdir -v ~buildbot/.ssh; sudo cp -vi .ssh/authorized_keys ~buildbot/.ssh/; sudo chown -vR buildbot:buildbot ~buildbot/.ssh; sudo chmod -vR go-rwx ~buildbot/.ssh'

scp -P 2287 /kvm/vms/ttyS0.conf buildbot@localhost:
scp -P 2288 /kvm/vms/ttyS0.conf buildbot@localhost:

ssh -p 2287 buildbot@localhost 'sudo apt-get update && sudo apt-get -y dist-upgrade;'
ssh -p 2288 buildbot@localhost 'sudo apt-get update && sudo apt-get -y dist-upgrade;'

ssh -p 2287 buildbot@localhost 'sudo cp -vi ttyS0.conf /etc/init/; rm -v ttyS0.conf; sudo shutdown -h now'
ssh -p 2288 buildbot@localhost 'sudo cp -vi ttyS0.conf /etc/init/; rm -v ttyS0.conf; sudo shutdown -h now'
```

Enabling passwordless sudo:

```
sudo VISUAL=vi visudo
# Add line at end: `%sudo ALL=NOPASSWD: ALL'
```

Editing /boot/grub/menu.lst:

```
sudo vi /etc/default/grub

# Add/edit these entries:
GRUB_HIDDEN_TIMEOUT_QUIET=false
GRUB_TIMEOUT=0
GRUB_CMDLINE_LINUX_DEFAULT="console=tty0 console=ttyS0,115200n8"
GRUB_TERMINAL="serial"
GRUB_SERIAL_COMMAND="serial --unit=0 --speed=115200 --word=8 --parity=no --stop=1"

sudo update-grub
# exit back to the host server
```

VMs for building .debs

```

done
```

Add Key to known_hosts

Do the following on each kvm host server (terrier, terrier2, i7, etc…) to add the VMs to known_hosts.

```
# saucy-amd64
cp -avi /kvm/vms/vm-saucy-amd64-install.qcow2 /kvm/vms/vm-saucy-amd64-test.qcow2
kvm -m 1024 -hda /kvm/vms/vm-saucy-amd64-test.qcow2 -redir tcp:2287::22 -boot c -smp 2 -cpu qemu64 -net
nic,model=virtio -net user -nographic
sudo su - buildbot
ssh -p 2287 buildbot@localhost sudo shutdown -h now
# answer "yes" when prompted
exit # the buildbot user
rm -v /kvm/vms/vm-saucy-amd64-test.qcow2

# saucy-i386
cp -avi /kvm/vms/vm-saucy-i386-install.qcow2 /kvm/vms/vm-saucy-i386-test.qcow2
kvm -m 1024 -hda /kvm/vms/vm-saucy-i386-test.qcow2 -redir tcp:2288::22 -boot c -smp 2 -cpu qemu64 -net
nic,model=virtio -net user -nographic
sudo su - buildbot
ssh -p 2288 buildbot@localhost sudo shutdown -h now
# answer "yes" when prompted
exit # the buildbot user
rm -v /kvm/vms/vm-saucy-i386-test.qcow2
```

Buildbot Setup for Virtual Machines - Ubuntu 14.04 “trusty”

Base Install

```
qemu-img create -f qcow2 /kvm/vms/vm-trusty-amd64-serial.qcow2 20G
qemu-img create -f qcow2 /kvm/vms/vm-trusty-i386-serial.qcow2 20G
```

Start each VM booting from the server install iso one at a time and perform the following install steps:

```
kvm -m 2048 -hda /kvm/vms/vm-trusty-amd64-serial.qcow2 \
  -cdrom /kvm/iso/ubuntu/trusty-server-amd64.iso \
  -boot d -smp 2 -cpu qemu64 \
  -net nic,model=virtio \
  -net user,hostfwd=tcp:127.0.0.1:2293-:22

kvm -m 2048 -hda /kvm/vms/vm-trusty-i386-serial.qcow2 \
  -cdrom /kvm/iso/ubuntu/trusty-server-i386.iso \
  -boot d -smp 2 -cpu qemu64 \
  -net nic,model=virtio \
  -net user,hostfwd=tcp:127.0.0.1:2294-:22
```

Once running you can connect to the VNC server from your local host with:

```
vncviewer -via ${remote_host} localhost
```

Replace ${remote-host} with the host the vm is running on.

Note: When you activate the install, vncviewer may disconnect with a complaint about the rect being too large. This is fine. Ubuntu has just resized the vnc screen. Simply reconnect.

During the install, pick default options for the most part, with the following notes:

- Set the hostname to `ubuntu-trusty-amd64` or `ubuntu-trusty-i386` (depending on which architecture we're installing)
- do not encrypt the home directory
- When prompted if the timezone is correct, answer "No" and when the list comes up, scroll to the bottom and choose "UTC"
- When partitioning disks, choose "Guided - use entire disk" (we do not want LVM)
- No automatic updates
- Choose software to install: OpenSSH server

Reboot when prompted. It will fail, so just kill the kvm process with `^Ctrl+C`.

Now that the VM is installed, it's time to configure it.
If you have the memory you can do the following simultaneously:

```
qemu-system-x86_64 -m 2048 -hda /kvm/vms/vm-trusty-amd64-serial.qcow2 \
  -boot c -smp 2 -cpu qemu64 \
  -net nic,model=virtio \
  -net user,hostfwd=tcp:127.0.0.1:2293-:22 \
  -nographic

qemu-system-x86_64 -m 2048 -hda /kvm/vms/vm-trusty-i386-serial.qcow2 \
  -boot c -smp 2 -cpu qemu64 \
  -net nic,model=virtio \
  -net user,hostfwd=tcp:127.0.0.1:2294-:22 \
  -nographic
```

- set `vim` as the preferred editor

```
ssh -t -p 2293 localhost sudo update-alternatives --config editor
ssh -t -p 2294 localhost sudo update-alternatives --config editor
```

- Enabling passwordless sudo:

```
sudo VISUAL=vi visudo
# Add line at end: `%sudo ALL=NOPASSWD: ALL'
```

- edit /boot/grub/menu.lst:

```
sudo vi /etc/default/grub

# Add/edit these entries:
GRUB_HIDDEN_TIMEOUT_QUIET=false
GRUB_TIMEOUT=0
GRUB_CMDLINE_LINUX_DEFAULT="console=tty0 console=ttyS0,115200n8"
GRUB_TERMINAL="serial"
GRUB_SERIAL_COMMAND="serial --unit=0 --speed=115200 --word=8 --parity=no --stop=1"

sudo update-grub
# exit back to the host server
```

- create the `.ssh` directory and the `sudo` group

```
ssh -t -p 2293 localhost "mkdir -v .ssh; sudo addgroup $USER sudo"
ssh -t -p 2294 localhost "mkdir -v .ssh; sudo addgroup $USER sudo"
```

- copy the `authorized_keys` file up to the VMs

```
scp -P 2293 /kvm/vms/authorized_keys localhost:.ssh/
scp -P 2294 /kvm/vms/authorized_keys localhost:.ssh/
```

- create the buildbot user on the amd64 VM

```
echo $'Buildbot\n\n\n\n\ny' | ssh -p 2293 localhost 'chmod -vR go-rwx .ssh; sudo adduser --disabled-password buildbot; sudo addgroup buildbot sudo; sudo mkdir -v ~buildbot/.ssh; sudo cp -vi .ssh/authorized_keys ~buildbot/.ssh/; sudo chown -vR buildbot:buildbot ~buildbot/.ssh; sudo chmod -vR go-rwx ~buildbot/.ssh'
```

- create the buildbot user on the x86 VM

```
echo $'Buildbot\n\n\n\n\ny' | ssh -p 2294 localhost 'chmod -vR go-rwx .ssh; sudo adduser --disabled-password buildbot; sudo addgroup buildbot sudo; sudo mkdir -v ~buildbot/.ssh; sudo cp -vi .ssh/authorized_keys ~buildbot/.ssh/; sudo chown -vR buildbot:buildbot ~buildbot/.ssh; sudo chmod -vR go-rwx ~buildbot/.ssh'
```

- copy the ttyS0 file to the VMs

```
scp -i -P 2293 /kvm/vms/ttyS0.conf buildbot@localhost:
scp -i -P 2294 /kvm/vms/ttyS0.conf buildbot@localhost:
```

- Apply all OS updates

```
ssh -t -i -p 2293 buildbot@localhost \
  'sudo apt-get update && sudo apt-get -y dist-upgrade;'

ssh -t -i -p 2294 buildbot@localhost \
  'sudo apt-get update && sudo apt-get -y dist-upgrade;'
```

- copy the ttyS0 file to its proper location and shut down the VM

```
ssh -t -i -p 2293 buildbot@localhost \
  'sudo cp -vi ttyS0.conf /etc/init/; rm -v ttyS0.conf; sudo shutdown -h now'

ssh -t -i -p 2294 buildbot@localhost \
  'sudo cp -vi ttyS0.conf /etc/init/; rm -v ttyS0.conf; sudo shutdown -h now'
```

VMs for building .debs

    'sudo DEBIAN_FRONTEND=noninteractive apt-get install -y patch libaio1 debconf-utils' \
    'sudo DEBIAN_FRONTEND=noninteractive apt-get upgrade -y'; \
done
```

Add Key to known_hosts

Do the following on each kvm host server (terrier, terrier2, i7, etc…) to add the VMs to known_hosts.

```
# trusty-amd64
cp -avi /kvm/vms/vm-trusty-amd64-install.qcow2 /kvm/vms/vm-trusty-amd64-test.qcow2
kvm -m 1024 -hda /kvm/vms/vm-trusty-amd64-test.qcow2 -redir tcp:2293::22 -boot c -smp 2 -cpu qemu64 -net
nic,model=virtio -net user -nographic
sudo su - buildbot
ssh -p 2293 buildbot@localhost sudo shutdown -h now
# answer "yes" when prompted
exit # the buildbot user
rm -v /kvm/vms/vm-trusty-amd64-test.qcow2

# trusty-i386
cp -avi /kvm/vms/vm-trusty-i386-install.qcow2 /kvm/vms/vm-trusty-i386-test.qcow2
kvm -m 1024 -hda /kvm/vms/vm-trusty-i386-test.qcow2 -redir tcp:2294::22 -boot c -smp 2 -cpu qemu64 -net
nic,model=virtio -net user -nographic
sudo su - buildbot
ssh -p 2294 buildbot@localhost sudo shutdown -h now
# answer "yes" when prompted
exit # the buildbot user
rm -v /kvm/vms/vm-trusty-i386-test.qcow2
```

Buildbot Setup for Virtual Machines - Ubuntu 8.04, 8.10, and 9.10

These 6 platforms were installed together (i386 and amd64).

Base Installations

Ubuntu 8.04 “Hardy” amd64:

```
qemu-img create -f qcow2 vm-hardy-amd64-serial.qcow2 8G
kvm -m 1024 -hda vm-hardy-amd64-serial.qcow2 -cdrom /kvm/ubuntu-8.04.3-server-amd64.iso -redir
tcp:2228::22 -boot d -smp 2 -cpu qemu64 -net nic,model=virtio -net user
# Install, picking default options mostly, only adding openssh server.
kvm -m 1024 -hda vm-hardy-amd64-serial.qcow2 -cdrom /kvm/ubuntu-8.04.3-server-amd64.iso -redir
tcp:2228::22 -boot c -smp 2 -cpu qemu64 -net nic,model=virtio -net user -nographic
ssh -p 2228 localhost
# edit /boot/grub/menu.lst and visudo, see below
sudo /sbin/shutdown -h now
kvm -m 1024 -hda vm-hardy-amd64-serial.qcow2 -cdrom /kvm/ubuntu-8.04.3-server-amd64.iso -redir
tcp:2228::22 -boot c -smp 2 -cpu qemu64 -net nic,model=virtio -net user -nographic
ssh -t -p 2228 localhost "mkdir .ssh; sudo addgroup $USER sudo"
scp -P 2228 authorized_keys localhost:.ssh/
echo $'Buildbot\n\n\n\n\ny' | ssh -p 2228 localhost 'chmod -R go-rwx .ssh; sudo adduser --disabled-
password buildbot; sudo addgroup buildbot sudo; sudo mkdir ~buildbot/.ssh; sudo cp .ssh/authorized_keys
~buildbot/.ssh/; sudo chown -R buildbot:buildbot ~buildbot/.ssh; sudo chmod -R go-rwx ~buildbot/.ssh'
scp -P 2228 ttyS0 buildbot@localhost:
ssh -p 2228 buildbot@localhost 'sudo cp ttyS0 /etc/event.d; rm ttyS0; sudo shutdown -h now'
```

Ubuntu 8.04 “Hardy” i386:

```
qemu-img create -f qcow2 vm-hardy-i386-serial.qcow2 8G
kvm -m 1024 -hda vm-hardy-i386-serial.qcow2 -cdrom /kvm/ubuntu-8.04.3-server-i386.iso -redir tcp:2229::22
-boot d -smp 2 -cpu qemu32,-nx -net nic,model=virtio -net user
# Install, picking default options mostly, only adding openssh server.
kvm -m 1024 -hda vm-hardy-i386-serial.qcow2 -cdrom /kvm/ubuntu-8.04.3-server-i386.iso -redir tcp:2229::22
-boot c -smp 2 -cpu qemu32,-nx -net nic,model=virtio -net user -nographic
ssh -p 2229 localhost
# edit /boot/grub/menu.lst and visudo, see below
ssh -t -p 2229 localhost "mkdir .ssh; sudo addgroup $USER sudo"
scp -P 2229 authorized_keys localhost:.ssh/
echo $'Buildbot\n\n\n\n\ny' | ssh -p 2229 localhost 'chmod -R go-rwx .ssh; sudo adduser --disabled-
password buildbot; sudo addgroup buildbot sudo; sudo mkdir ~buildbot/.ssh; sudo cp .ssh/authorized_keys
~buildbot/.ssh/; sudo chown -R buildbot:buildbot ~buildbot/.ssh; sudo chmod -R go-rwx ~buildbot/.ssh'
scp -P 2229 ttyS0 buildbot@localhost:
ssh -p 2229 buildbot@localhost 'sudo cp ttyS0 /etc/event.d; rm ttyS0; sudo shutdown -h now'
```

Ubuntu 8.10 “Intrepid” amd64:

```
qemu-img create -f qcow2 vm-intrepid-amd64-serial.qcow2 8G
kvm -m 1024 -hda vm-intrepid-amd64-serial.qcow2 -cdrom /kvm/ubuntu-8.10-server-amd64.iso -redir
tcp:2230::22 -boot d -smp 2 -cpu qemu64 -net nic,model=virtio -net user
# Install, picking default options mostly, only adding openssh server.
kvm -m 1024 -hda vm-intrepid-amd64-serial.qcow2 -cdrom /kvm/ubuntu-8.10-server-amd64.iso -redir
tcp:2230::22 -boot c -smp 2 -cpu qemu64 -net nic,model=virtio -net user -nographic
ssh -p 2230 localhost
# edit /boot/grub/menu.lst and visudo, see below
ssh -t -p 2230 localhost "mkdir .ssh; sudo addgroup $USER sudo"
scp -P 2230 authorized_keys localhost:.ssh/
echo $'Buildbot\n\n\n\n\ny' | ssh -p 2230 localhost 'chmod -R go-rwx .ssh; sudo adduser --disabled-
password buildbot; sudo addgroup buildbot sudo; sudo mkdir ~buildbot/.ssh; sudo cp .ssh/authorized_keys
~buildbot/.ssh/; sudo chown -R buildbot:buildbot ~buildbot/.ssh; sudo chmod -R go-rwx ~buildbot/.ssh'
scp -P 2230 ttyS0 buildbot@localhost:
ssh -p 2230 buildbot@localhost 'sudo cp ttyS0 /etc/event.d; rm ttyS0; sudo shutdown -h now'
```

Ubuntu 8.10 “Intrepid” i386:

```
qemu-img create -f qcow2 vm-intrepid-i386-serial.qcow2 8G
kvm -m 1024 -hda vm-intrepid-i386-serial.qcow2 -cdrom /kvm/ubuntu-8.10-server-i386.iso -redir
tcp:2231::22 -boot d -smp 2 -cpu qemu32,-nx -net nic,model=virtio -net user
# Install, picking default options mostly, only adding openssh server.
kvm -m 1024 -hda vm-intrepid-i386-serial.qcow2 -cdrom /kvm/ubuntu-8.10-server-i386.iso -redir
tcp:2231::22 -boot c -smp 2 -cpu qemu32,-nx -net nic,model=virtio -net user -nographic
ssh -p 2231 localhost
# edit /boot/grub/menu.lst and visudo, see below
ssh -t -p 2231 localhost "mkdir .ssh; sudo addgroup $USER sudo"
scp -P 2231 authorized_keys localhost:.ssh/
echo $'Buildbot\n\n\n\n\ny' | ssh -p 2231 localhost 'chmod -R go-rwx .ssh; sudo adduser --disabled-
password buildbot; sudo addgroup buildbot sudo; sudo mkdir ~buildbot/.ssh; sudo cp .ssh/authorized_keys
~buildbot/.ssh/; sudo chown -R buildbot:buildbot ~buildbot/.ssh; sudo chmod -R go-rwx ~buildbot/.ssh'
scp -P 2231 ttyS0 buildbot@localhost:
ssh -p 2231 buildbot@localhost 'sudo cp ttyS0 /etc/event.d; rm ttyS0; sudo shutdown -h now'
```

Ubuntu 9.10 “Karmic” amd64:

```
qemu-img create -f qcow2 vm-karmic-amd64-serial.qcow2 8G
kvm -m 1024 -hda vm-karmic-amd64-serial.qcow2 -cdrom /kvm/ubuntu-9.10-server-amd64.iso -redir
tcp:2232::22 -boot d -smp 2 -cpu qemu64 -net nic,model=virtio -net user
# Install, picking default options mostly, only adding openssh server.
kvm -m 1024 -hda vm-karmic-amd64-serial.qcow2 -cdrom /kvm/ubuntu-9.10-server-amd64.iso -redir
tcp:2232::22 -boot c -smp 2 -cpu qemu64 -net nic,model=virtio -net user -nographic
ssh -p 2232 localhost
# edit /boot/grub/menu.lst and visudo, see below
ssh -t -p 2232 localhost "mkdir .ssh; sudo addgroup $USER sudo"
scp -P 2232 authorized_keys localhost:.ssh/
echo $'Buildbot\n\n\n\n\ny' | ssh -p 2232 localhost 'chmod -R go-rwx .ssh; sudo adduser --disabled-
password buildbot; sudo addgroup buildbot sudo; sudo mkdir ~buildbot/.ssh; sudo cp .ssh/authorized_keys
~buildbot/.ssh/; sudo chown -R buildbot:buildbot ~buildbot/.ssh; sudo chmod -R go-rwx ~buildbot/.ssh'
scp -P 2232 ttyS0.conf buildbot@localhost:
ssh -p 2232 buildbot@localhost 'sudo cp ttyS0.conf /etc/init/; rm ttyS0.conf; sudo shutdown -h now'
```

Ubuntu 9.10 “Karmic” i386:

```
qemu-img create -f qcow2 vm-karmic-i386-serial.qcow2 8G
kvm -m 1024 -hda vm-karmic-i386-serial.qcow2 -cdrom /kvm/ubuntu-9.10-server-i386.iso -redir tcp:2233::22
-boot d -smp 2 -cpu qemu32,-nx -net nic,model=virtio -net user
# Install, picking default options mostly, only adding openssh server.
kvm -m 1024 -hda vm-karmic-i386-serial.qcow2 -cdrom /kvm/ubuntu-9.10-server-i386.iso -redir tcp:2233::22
-boot c -smp 2 -cpu qemu32,-nx -net nic,model=virtio -net user -nographic
ssh -p 2233 localhost
# edit /boot/grub/menu.lst and visudo, see below
ssh -t -p 2233 localhost "mkdir .ssh; sudo addgroup $USER sudo"
scp -P 2233 authorized_keys localhost:.ssh/
echo $'Buildbot\n\n\n\n\ny' | ssh -p 2233 localhost 'chmod -R go-rwx .ssh; sudo adduser --disabled-
password buildbot; sudo addgroup buildbot sudo; sudo mkdir ~buildbot/.ssh; sudo cp .ssh/authorized_keys
~buildbot/.ssh/; sudo chown -R buildbot:buildbot ~buildbot/.ssh; sudo chmod -R go-rwx ~buildbot/.ssh'
scp -P 2233 ttyS0.conf buildbot@localhost:
ssh -p 2233 buildbot@localhost 'sudo cp ttyS0.conf /etc/init/; rm ttyS0.conf; sudo shutdown -h now'
```

For visudo to enable passwordless sudo:

```
sudo VISUAL=vi visudo

# uncomment `%sudo ALL=NOPASSWD: ALL' line in `visudo`, and move to end.
```

For 8.04/8.10/9.04, /boot/grub/menu.lst is edited as follows:

```
sudo vi /boot/grub/menu.lst

# Add this:
  serial --unit=0 --speed=115200 --word=8 --parity=no --stop=1
  terminal --timeout=3 serial console

# Also add in menu.lst to kernel line (after removing `quiet splash'):
  console=tty0 console=ttyS0,115200n8
```

For 9.10, /boot/grub/menu.lst is edited as follows:

```
sudo vi /etc/default/grub

# Add/edit these entries:
    GRUB_CMDLINE_LINUX_DEFAULT="console=tty0 console=ttyS0,115200n8"
    GRUB_TERMINAL="serial"
    GRUB_SERIAL_COMMAND="serial --unit=0 --speed=115200 --word=8 --parity=no --stop=1"

sudo update-grub
```

VMs for building .debs

```
for i in 'vm-hardy-amd64-serial.qcow2 2228 qemu64' 'vm-hardy-i386-serial.qcow2 2229 qemu32,-nx' 'vm-
intrepid-amd64-serial.qcow2 2230 qemu64' 'vm-intrepid-i386-serial.qcow2 2231 qemu32,-nx' ; do \
  set $i; \
  runvm --logfile=kernel_$2.log --base-image=$1 --port=$2 --cpu=$3 "$(echo $1 | sed -e
's/serial/build/')" \
    "sudo DEBIAN_FRONTEND=noninteractive apt-get build-dep -y mysql-server-5.0" \
    "sudo DEBIAN_FRONTEND=noninteractive apt-get install -y devscripts hardening-wrapper fakeroot doxygen
texlive-latex-base ghostscript libevent-dev libssl-dev zlib1g-dev libreadline5-dev" ; \
done

for i in 'vm-karmic-amd64-serial.qcow2 2232 qemu64' 'vm-karmic-i386-serial.qcow2 2233 qemu32,-nx' ; do \

```

VMs for install testing

See the General Principles article for how to make the '`my.seed`' and '`sources.append`' files.

```
for i in 'vm-hardy-amd64-serial.qcow2 2228 qemu64' 'vm-hardy-i386-serial.qcow2 2229 qemu32,-nx' 'vm-
intrepid-amd64-serial.qcow2 2230 qemu64' 'vm-intrepid-i386-serial.qcow2 2231 qemu32,-nx' 'vm-karmic-
amd64-serial.qcow2 2232 qemu64' 'vm-karmic-i386-serial.qcow2 2233 qemu32,-nx' ; do \
  set $i; \
  runvm --logfile=kernel_$2.log --base-image=$1 --port=$2 --cpu=$3 "$(echo $1 | sed -e
's/serial/install/')" \
      "sudo DEBIAN_FRONTEND=noninteractive apt-get update" \
      "sudo DEBIAN_FRONTEND=noninteractive apt-get install -y debconf-utils" \
      "= scp -P $2 my.seed sources.append buildbot@localhost:/tmp/" \
      "sudo debconf-set-selections /tmp/my.seed" \
      "sudo sh -c 'cat /tmp/sources.append >> /etc/apt/sources.list'"; \
done
```

VMs for upgrade testing

```
for i in 'vm-hardy-amd64-install.qcow2 2228 qemu64' 'vm-hardy-i386-install.qcow2 2229 qemu32,-nx' 'vm-
intrepid-amd64-install.qcow2 2230 qemu64' 'vm-intrepid-i386-install.qcow2 2231 qemu32,-nx' ; do \
  set $i; \
  runvm --logfile=kernel_$2.log --base-image=$1 --port=$2 --cpu=$3 "$(echo $1 | sed -e
's/install/upgrade/')" \
  'sudo DEBIAN_FRONTEND=noninteractive apt-get install -y mysql-server-5.0'
  'mysql -uroot -prootpass -e "create database mytest; use mytest; create table t(a int primary key);
insert into t values (1); select * from t"' ; \
done

for i in 'vm-karmic-amd64-install.qcow2 2232 qemu64' 'vm-karmic-i386-install.qcow2 2233 qemu32,-nx' ; do
\
  set $i; \
  runvm --logfile=kernel_$2.log --base-image=$1 --port=$2 --cpu=$3 "$(echo $1 | sed -e
's/install/upgrade/')" \
    'sudo DEBIAN_FRONTEND=noninteractive apt-get install -y mysql-server-5.1' \
    'mysql -uroot -prootpass -e "create database mytest; use mytest; create table t(a int primary key);
insert into t values (1); select * from t"' ; \
done
```

Buildbot Setup for Virtual Machines - Ubuntu 9.04 amd64

Base Install

```
qemu-img create -f qcow2 vm-jaunty-amd64-serial.qcow2 8G
kvm -m 1024 -hda vm-jaunty-amd64-serial.qcow2 -cdrom /kvm/ubuntu-9.04-server-amd64.iso -redir
tcp:2227::22 -boot d -smp 2 -cpu qemu64 -net nic,model=virtio -net user
```

Serial port and passwordless login/sudo

```
kvm -m 1024 -hda vm-jaunty-amd64-serial.qcow2 -cdrom /kvm/ubuntu-9.04-server-amd64.iso -redir
tcp:2227::22 -boot c -smp 2 -cpu qemu64 -net nic,model=virtio -net user

sudo apt-get install emacs22-nox
```

Add to /boot/grub/menu.lst:

```
serial --unit=0 --speed=115200 --word=8 --parity=no --stop=1
terminal --timeout=3 serial console
```

also add in menu.lst to kernel line (after removing `quiet splash'):

```
console=tty0 console=ttyS0,115200n8
```

Create /etc/event.d/ttyS0:

```
# ttyS0 - getty
#
# This service maintains a getty on ttyS0 from the point the system is
# started until it is shut down again.

start on stopped rc2
start on stopped rc3
start on stopped rc4
start on stopped rc5

stop on runlevel 0
stop on runlevel 1
stop on runlevel 6

respawn
exec /sbin/getty 115200 ttyS0
```

Add account and allow passwordless sudo:

```
sudo adduser --disabled-password buildbot
sudo adduser buildbot sudo
sudo EDITOR=emacs visudo
# uncomment `%sudo ALL=NOPASSWD: ALL' line in `visudo`, and move to end.

sudo su -s /bin/bash - buildbot
mkdir .ssh
cat >.ssh/authorized_keys
# Paste public key for buildbot user on host system.
chmod -R go-rwx .ssh
# Do manual login from host to guest once, to make sure .ssh/known_hosts is updated.
```

VM for .deb building

```
qemu-img create -b vm-jaunty-amd64-serial.qcow2 -f qcow2 vm-jaunty-amd64-build.qcow2
kvm -m 1024 -hda vm-jaunty-amd64-build.qcow2 -cdrom /kvm/ubuntu-9.04-server-amd64.iso -redir tcp:2227::22
-boot c -smp 2 -cpu qemu64 -net nic,model=virtio -net user -nographic

sudo apt-get build-dep mysql-server-5.1
```

VM for install testing

```
qemu-img create -b vm-jaunty-amd64-serial.qcow2 -f qcow2 vm-jaunty-amd64-install.qcow2
kvm -m 1024 -hda vm-jaunty-amd64-install.qcow2 -cdrom /kvm/ubuntu-9.04-server-amd64.iso -redir
tcp:2227::22 -boot c -smp 2 -cpu qemu64 -net nic,model=virtio -net user -nographic

sudo adduser --system --group mysql
```

This page is licensed: CC BY-SA / Gnu FDL

Buildbot Setup for Virtual Machines - Ubuntu 9.04 i386

This vm is used to build source tarball and for Ubuntu 9.04 32-bit .deb.

First create and install image:

```
qemu-img create -f qcow2 vm-jaunty-i386-base.qcow2 8G
kvm -m 2047 -hda vm-jaunty-i386-base.qcow2 -cdrom ubuntu-9.04-server-i386.iso -redir tcp:2222::22 -boot d
-cpu qemu32,-nx
# Install
```

Create a vm, based on the first one, which is configured for serial port.

```
qemu-img create -b vm-jaunty-i386-base.qcow2 -f qcow2 vm-jaunty-i386-serial.qcow2
kvm -m 2047 -hda vm-jaunty-i386-base.qcow2 -redir tcp:2222::22 -boot c -cpu qemu32,-nx
```

To configure kernel and grub for serial console, add the following to /boot/grub/menu.lst:

```
serial --unit=0 --speed=115200 --word=8 --parity=no --stop=1
terminal --timeout=3 serial console
```

also add in menu.lst to kernel line (after removing `quiet splash'):

```
console=tty0 console=ttyS0,115200n8
```

Create /etc/event.d/ttyS0:

```
# ttyS0 - getty
#
# This service maintains a getty on ttyS0 from the point the system is
# started until it is shut down again.

start on stopped rc2
start on stopped rc3
start on stopped rc4
start on stopped rc5

stop on runlevel 0
stop on runlevel 1
stop on runlevel 6

respawn
exec /sbin/getty 115200 ttyS0
```

Add an account:

```
sudo adduser --disabled-password buildbot
```

Copy public ssh key into /.ssh/authorized_keys

Enable passwordless sudo:

```
sudo adduser buildbot sudo
# uncomment `%sudo ALL=NOPASSWD: ALL' line in `visudo`, and move to end.
```

Create a new vm for building source tarballs:

```
qemu-img create -b vm-jaunty-i386-serial.qcow2 -f qcow2 vm-jaunty-i386-deb-tarbake.qcow2
```

Install compilers:

```
sudo apt-get build-dep mysql-5.1-server
sudo apt-get install devscripts hardening-wrapper bzr
```

Copy in an existing bzr shared repository to buildbot/.bzr (or run bzr init-repo and bzr branch –no-tree lp:maria).

Create a new vm for building .debs:

```
qemu-img create -b vm-jaunty-i386-serial.qcow2 -f qcow2 vm-jaunty-i386-deb-build.qcow2
```

Install compilers:

```
sudo apt-get build-dep mysql-5.1-server
sudo apt-get install devscripts hardening-wrapper
```

Create a new VM for testing .deb installs:

```
qemu-img create -b vm-jaunty-i386-serial.qcow2 -f qcow2 vm-jaunty-i386-deb-install.qcow2
```

Install tools and local apt repository.

```
sudo apt-get install debconf-utils
cat >>/etc/apt/sources.list <<END
deb file:///home/buildbot/buildbot/debs binary/
deb-src file:///home/buildbot/buildbot/debs source/
END
```

Setup default package config for debconf to enable unattended install. Copy in my.seed (see above) to vm.

```
sudo debconf-set-selections /tmp/my.seed
```

Create a new VM for testing upgrades:

```
qemu-img create -b vm-jaunty-i386-deb-install.qcow2 -f qcow2 vm-jaunty-i386-deb-upgrade.qcow2
```

Prepare initial MySQL install with some test data.

```
sudo apt-get install mysql-server-5.1
mysql -uroot -prootpass -e "create database mytest; use mytest; create table t(a int primary key); insert
into t values (1); select * from t"
```

Using Git

Getting the Source

If you just want to get the latest source and don't require the ability to push changes to the MariaDB repository, you can use the following command to check out the latest branch (replace `10.5` with `latest` or the latest branch version):

```
git clone -b 10.5 https://github.com/MariaDB/server.git
```

Setup of git for MariaDB

- Set your name with git

```
git config --global user.name "Ivan Ivanov"
git config --global user.email "ivan@mariadb.com"
```

- Go to ssh and add your public SSH key (GitHub Help).
- Clone the repository

```
git clone git@github.com:MariaDB/server.git
cd server
git checkout 10.5
```

- Config repository pull and alias for fast forward:

```
git config pull.ff only
git config --global alias.ff "merge --ff-only"
```

Commit Comments

In git commit messages are normally formatted like this:

```
subject

body
more body
...
```

That is, the first line is considered a *subject*, much like email subject. Many git commands and pages on GitHub only show the commit subject, not the complete comment. After the subject goes an empty line, then the detailed description of the comment. Structure your commit comments this way, and don't forget the empty line.

Branches

In Git, each repository has only one branch that is currently checked out.

```
git branch
```

List Existing Branches

To see which branches exists locally and remotely:

```
git branch --all
```

To Move to Work on a Specific Branch

```
git checkout branch-name
```

Note that if the output from `git branch --all` is `remotes/origin/XXX` you should just use `XXX` as branch name.

Making a Local Copy of a Branch (Like bzr clone)

```
branch clone old_directory new_directory
cd new_directory
git remote set-url origin git@github.com:MariaDB/server.git
git pull
```

Remove Last Commit From a Branch

```
git reset --hard HEAD^
```

Fetch a Branch Someone Has Done a Rebase on

If you get the following error on pull:

```
shell>  git pull
X11 forwarding request failed on channel 0
fatal: Not possible to fast-forward, aborting.
```

Instead of removing your copy and then clone, you can do:

```
git reset --hard origin/##branch-name##
```

Other Things About Branches

- Note: branches whose names start with `bb-` are automatically put into the buildbot.

Commit Emails

In the MariaDB project, it is a good idea (and a long tradition since MySQL Ab) to have all your commits sent to a commits@mariadb.org mailing list. It allows others to follow the progress, comment, etc.

A script and instructions on how to setup commit triggers in Git are here:. Jira task for commit trigger was MDEV-6278.

Attributing Code to Someone Else

If you add code on behalf of someone else, please attribute the code to the original author:

- Run `git citool` and move changed files to staged.
- Don't `commit`, abort instead
- run `git commit --author="Original author name <email_address>"`

The above is needed as `git citool` can't handle the `--author` option.

Applying a Pull Request

At the end of the pull request page there is a button "Merge pull request" and next to it a link "command line instructions". Click the link, you'll see something like

Step 1: From your project repository, check out a new branch and test the changes.

```
git checkout -b mariadb-server-joeuser-cool-feature 10.3
git pull https://github.com/joeuser/mariadb-server cool-feature
```

Step 2: Merge the changes and update on GitHub.

```
git checkout 10.3
git merge --no-ff mariadb-server-joeuser-cool-feature
git push origin 10.3
```

Note where to pull from.

Now, checkout the branch you want to merge it to, say, `bb-10.3-stage`, and do the following

```
git fetch https://github.com/joeuser/mariadb-server cool-feature
git checkout FETCH_HEAD
git rebase @{-1}
```

Now's the time to compile the code, test it, fix, if necessary. Issue these commands:

```
git checkout @{-1}
git ff @{-1}
```

If you want to do small changes to the pull request, do it in a separate commit, after `git rebase @{-1}` above. If you want to do *big* changes to the pull request, perhaps you shouldn't merge it in the first place, but ask the contributor to fix it?

Examples

Diff For Last Commit

```
git show
```

Applying New Code From Main Tree to a Branch

You are working on a branch (`NEW_FEATURE`) and would like to have into that branch all changes from the main branch (`10.1`).

```
git checkout 10.1
git pull
git checkout NEW_FEATURE
git rebase 10.1
```

Applying a Bugfix in the Main Branch

You've just fixed and committed a bug in the main 10.1 branch and want to merge it with the latest 10.1. Often a rebase is better in this case. Assuming your current checked out branch is 10.1:

```
git fetch origin
git rebase origin/10.1
```

This will work even if you have done multiple commits in your local 10.1 tree.

Dealing With Conflicts When One Tries to Push

What to do when you have fixed a bug in the main tree but notices that someone has changed the tree since you pulled last time. This approach ensures that your patch is done in one block and not spread out over several change sets.

```
git clone 10.1
cd 10.1
< fix a bug here>
git citool
git push
# ^ and the above fails, because someone has pushed to 10.1 in between
git branch tmp
# ^ copy our work to branch named 'tmp'
get checkout 10.1
git reset --hard HEAD^
# ^ remove our work from '10.1' local branch'
git pull
# ^ get changes from remote
git checkout tmp
git rebase 10.1
# ^ switch to 'tmp' and try to rebase 'tmp' branch on top of 10.1 branch.
#   here you will be asked to merge if necessary
git checkout 10.1
git pull --ff . tmp
# ^ switch back to the '10.1' branch, and pull from 'tmp' branch.
git branch -D tmp
#^ this removes the tmp. branch
git push
```

Finding in Which MariaDB Version a Commit Exists

```
sh> git tag --contain e65f667bb60244610512efd7491fc77eccceb9db
mariadb-10.0.30
mariadb-10.1.22
mariadb-10.1.23
mariadb-10.2.5
mariadb-10.3.0
mariadb-galera-10.0.30
```

Configuring Git to Send Commit Notices

Commit emails for MariaDB are sent to commits@lists.mariadb.org. You can find the archive here.

To allow others to see what you are working on in your MariaDB tree:

1. subscribe to the email list
2. configure git to send your commits to commits@mariab.org.

Download the post-commit git trigger script. Configure as:

```
git config --global hooks.postcommitrecipients "commits@mariadb.org"
git config --global hooks.postcommitbranches "*"
```

Also you might want to check the README for the post-commit trigger.

The post-commit git trigger uses *sendmail* for sending emails. Some platforms don't have *sendmail* and then you'll need to modify to make use of something that is supported.

Also, the post-commit trigger is just one approach. You can also use git-email on at least Debian and Fedora to send commit emails to the MariaDB commits email list.

Creating a New Merge Tree

> **Note:**
>
> This page contains background information for MariaDB developers.

A **merge tree** is a branch created specifically to simplify merges of third-party packages into MariaDB. It contains nothing but pristine upstream sources, laid out at the same paths they occupy in the MariaDB tree. That gives a clear separation between upstream changes and MariaDB changes, so that in most cases Git can merge new upstream releases automatically.

MariaDB merge trees live in the mergetrees repository. Each third-party package has its own branch, named `merge-<package>` — for example `merge-pcre`, `merge-zlib`, or `merge-innodb-5.7`. The branches are independent of each other and share no history.

Create a merge tree once per package. Afterwards, updating it for each new upstream release is a separate and much shorter procedure — see Merging with a Merge Tree.

Prerequisites

The package should already be present in the MariaDB tree, together with any MariaDB changes to it. You also need to know which upstream release corresponds to the copy currently in the tree, because the merge tree must start from exactly that version. Starting from a different version makes the first real merge produce spurious conflicts.

Creating the Branch

Clone the `mergetrees` repository and create an orphan branch for the package. An orphan branch starts with no history, which is what you want — the merge tree is not a variation of any other merge tree.

```
git clone https://github.com/MariaDB/mergetrees
cd mergetrees
git checkout --orphan merge-pcre
git rm -rf .
```

Adding the Upstream Sources

Download the upstream source tarball of the same version that is already in the MariaDB tree, and unpack it so that the files sit at **the same paths they have in the MariaDB tree**. This layout is what lets Git match the files up during a merge, so it is the step that matters most.

```
tar xf ~/pcre-8.34.tar.bz2
mv pcre-8.34 pcre
```

Then commit, using the upstream version as the commit message, and push the branch:

```
git add .
git commit -m 'pcre-8.34'
git push --set-upstream origin merge-pcre
```

Recording the Merge Base

The new branch now has to be connected to the MariaDB tree, so that later merges bring across only the upstream changes since this point. Do that with a **null merge** — a merge that records the ancestry without changing a single file.

In your MariaDB tree, add the merge tree repository as a remote:

```
git remote add merge https://github.com/MariaDB/mergetrees
git fetch merge
```

Then merge the new branch with the `ours` strategy, which keeps the MariaDB tree exactly as it is:

```
git merge --allow-unrelated-histories -s ours merge/merge-pcre
```

> **Note:**
>
> `-s ours` is what makes this a null merge: the resulting commit has two parents but its content is identical to the MariaDB tree before the merge. `--allow-unrelated-histories` is required because the merge tree branch is an orphan.

Verify that nothing changed, then push:

```
git diff HEAD^1 --stat
```

The command produces no output if the merge was correctly a null merge. Use a commit message that identifies the package and the version, following the existing convention:

```
pcre-8.34 mergetree initial merge
```

The merge tree is now ready. From here on, use Merging with a Merge Tree to pull in each new upstream release.

Merging with a Merge Tree

> **Note:**
>
> This page contains background information for MariaDB developers.

If you have a merge tree, you merge into MariaDB as follows:

1. MariaDB merge trees are in the mergetrees repository. Add it as a new remote:

```
git remote add merge https://github.com/MariaDB/mergetrees
```

1. Check out the branch you want to update and merge, for example:

```
git checkout merge-innodb-5.6
```

1. delete everything in the branch
2. download the latest released source tarball, unpack it, copy files into the repository:

- for InnoDB-5.6: use the content of the `storage/innobase/` of the latest MySQL 5.6 source release tarball.
- for performance schema 5.6: use `storage/perfschema`, `include/mysql/psi`, `mysql-test/suite/perfschema`, and `mysql-test/suite/perfschema_stress` from the latest MySQL 5.6 source release tarball.
- for SphinxSE: use `mysqlse/` subdirectory from the latest Sphinx source release tarball.
- for XtraDB: use the content of the `storage/innobase/` of the latest Percona-Server source release tarball (5.5 or 5.6 as appropriate).
- for pcre: simply unpack the latest pcre release source tarball into the repository, rename `pcre-X-XX/` to `pcre`.

1. Now `git add .`, `git commit` (use the tarball version as a comment), `git push`
2. merge this branch into MariaDB
3. Sometimes after a merge, some changes may be needed:

- for performance schema 5.6: update `storage/perfschema/ha_perfschema.cc`, plugin version under `maria_declare_plugin`.
- for InnoDB-5.6: update `storage/innobase/include/univ.i`, setting `INNODB_VERSION_MAJOR`, `INNODB_VERSION_MINOR`, `INNODB_VERSION_BUGFIX` to whatever MySQL version you were merging from.
- for XtraDB-5.5: update `storage/xtradb/include/univ.i`, setting `PERCONA_INNODB_VERSION`, `INNODB_VERSION_STR` to whatever Percona-Server version you were merging from.
- for XtraDB-5.6: update `storage/xtradb/include/univ.i`, setting `PERCONA_INNODB_VERSION`, `INNODB_VERSION_MAJOR`, `INNODB_VERSION_MINOR`, `INNODB_VERSION_BUGFIX` to whatever Percona-Server version you were merging from.

Stored Procedure Internals

> **Note:**
>
> This page contains background information for MariaDB developers.

Implementation Specification for Stored Procedures

How Parsing and Execution of Queries Work

In order to execute a query, the function `sql_parse.cc:mysql_parse()` is called, which in turn calls the parser (`yyparse()`) with an updated Lex structure as the result. `mysql_parse()` then calls `mysql_execute_command()` which dispatches on the command code (in Lex) to the corresponding code for executing that particular query.

There are three structures involved in the execution of a query which are of interest to the stored procedure implementation:

- Lex (mentioned above) is the "compiled" query, that is the output from the parser and what is then interpreted to do the actual work.
  It contains an enum value (sql_command) which is the query type, and all the data collected by the parser needed for the execution (table names, fields, values, etc).
- THD is the "run-time" state of a connection, containing all that is needed for a particular client connection, and, among other things, the
  Lex structure currently being executed.
- `Item_*`: During parsing, all data is translated into "items", objects of the subclasses of "Item", such as `Item_int`, `Item_real`, `Item_string`, etc., for basic datatypes, and also various more specialized Item types for expressions to be evaluated (`Item_func` objects).

How to Fit Stored Procedures into this Scheme

Overview of the Classes and Files for Stored Procedures

(More detailed APIs at the end of this page)

class sp_head (sp_head.{cc,h})

This contains, among other things, an array of "instructions" and the method for executing the procedure.

class sp_pcontext (sp_pcontext.{cc,h}

This is the parse context for the procedure. It's primarily used during parsing to keep track of local parameters, variables and labels, but it's also used at CALL time to find the parameters mode (IN, OUT or INOUT) and type when setting up the runtime context.

class sp_instr (sp_head.{cc,h})

This is the base class for "instructions", that is, what is generated by the parser. It turns out that we only need a minimum of 5 different sub classes:

- sp_instr_stmt
  Execute a statement. This is the "call-out" any normal SQL statement, like a SELECT, INSERT etc. It contains the Lex structure for the statement in question.
- sp_instr_set
  Set the value of a local variable (or parameter)
- sp_instr_jump
  An unconditional jump.
- sp_instr_jump_if_not
  Jump if condition is not true. It turns out that the negative test is most convenient when generating the code for the flow control constructs.
- sp_instr_freturn
  Return a value from a FUNCTION and exit.
  For condition HANDLERs some special instructions are also needed, see that section below.

class sp_rcontext (sp_rcontext.h)

This is the runtime context in the THD structure.
It contains an array of items, the parameters and local variables for the currently executing stored procedure.
This means that variable value lookup is in runtime is constant time, a simple index operation.

class Item_splocal (Item.{cc,h})

This is a subclass of Item. Its sole purpose is to hide the fact that the real Item is actually in the current frame (runtime context).
It contains the frame offset and defers all methods to the real Item in the frame. This is what the parser generates for local variables.

Utility Functions (sp.{cc,h})

This contains functions for creating, dropping and finding a stored procedure in the mysql.proc table (or the internal cache).

Parsing CREATE PROCEDURE

When parsing a CREATE PROCEDURE the parser first initializes the `sphead` and `spcont` (runtime context) fields in the Lex.
The sql_command code for the result of parsing a is `SQLCOM_CREATE_PROCEDURE`.

The parsing of the parameter list and body is relatively straightforward:

- Parameters:
  name, type and mode (IN/OUT/INOUT) is pushed to `spcont`
- Declared local variables:
  Same as parameters (mode is then IN)
- Local Variable references:
  If an identifier is found in `spcont`, an `Item_splocal` is created with the variable's frame index, otherwise an `Item_field` or `Item_ref` is created (as before).
- Statements:
  The Lex in THD is replaced by a new Lex structure and the statement, is parsed as usual. A `sp_instr_stmt` is created, containing the new
  Lex, and added to the instructions in `sphead`.
  Afterwards, the procedure's Lex is restored in THD.
- SET var:
  Setting a local variable generates a `sp_instr_set` instruction, containing the variable's frame offset, the expression (an Item), and the type.
- Flow control:
  Flow control constructs such as IF, WHILE, etc, generate a conditional and unconditional jumps in the "obvious" way, but a few notes may be required:
- Forward jumps: When jumping forward, the exact destination is not known at the time of the creation of the jump instruction. The
  1. sphead `therefore contains a list of instruction-label pairs for each forward reference. When the position later is known, the instructions in the list are updated with the correct location.`
- Loop constructs have optional labels. If a loop doesn't have a label, an anonymous label is generated to simplify the parsing.
- There are two types of CASE. The "simple" case is implemented with an anonymous variable bound to the value to be tested.

A Simple Example

Parsing the procedure:

```
CREATE PROCEDURE a(s CHAR(16))
      BEGIN
        DECLARE x INT;
        SET x = 3;
        WHILE x > 0 DO
          SET x = x-1;
          INSERT INTO db.tab VALUES (x, s);
        END WHILE;
      END
```

would generate the following structures:

```
______
      thd: |      |     _________
           | lex -+--->|         |                     ___________________
           |______|    | spcont -+------------------->| "s",in,char(16):0 |
                       | sphead -+------              |("x",in,int     :1)|
                       |_________|      |              |___________________|
                                        |
                                  ____V_____________________
                                 | m_name: "a"            |
                                 | m_defstr: "create ..."|
                                 | m_instr: ...           |
                                 |________________________|
```

Note that the contents of the `spcont` is changing during the parsing, at all times reflecting the state of the would-be runtime frame.
The `m_instr` is an array of instructions:

```
Pos.  Instruction
       0    sp_instr_set(1, '3')
       1    sp_instr_jump_if_not(5, 'x>0')
       2    sp_instr_set(1, 'x-1')
       3    sp_instr_stmt('insert into ...')
       4    sp_instr_jump(1)
       5    <end>
```

Here, '3', 'x>0', etc, represent the Items or Lex for the respective expressions or statements.

Parsing CREATE FUNCTION

Creating a function is essentially the same thing as for a PROCEDURE, with the addition that a FUNCTION has a return type and a RETURN statement, but no OUT or INOUT parameters.

The main difference during parsing is that we store the result type in the sp_head. However, there are big differences when it comes to invoking a FUNCTION. (See below.)

Storing, Caching, Dropping

As seen above, the entire definition string, including the "CREATE PROCEDURE" (or "FUNCTION") is kept. The procedure definition string is stored in the table mysql.proc with the name and type as the key, the type being one of the enum ("procedure","function").

A PROCEDURE is just stored in the mysql.proc table. A FUNCTION has an additional requirement. They will be called in expressions with the same syntax as UDFs, so UDFs and stored FUNCTIONs share the namespace. Thus, we must make sure that we do not have UDFs and FUNCTIONs with the same name (even if they are stored in different places).

This means that we can reparse the procedure as many time as we want.
The first time, the resulting Lex is used to store the procedure in the database (using the function sp.c:sp_create_procedure()).

The simplest way would be to just leave it at that, and re-read the procedure from the database each time it is called. (And in fact, that's the way the earliest implementation will work.)
However, this is not very efficient, and we can do better. The full implementation should work like this:

1. Upon creation time, parse and store the procedure. Note that we still need to parse it to catch syntax errors, but we can't check if called procedures exists for instance.
2. Upon first CALL, read from the database, parse it, and cache the resulting Lex in memory. This time we can do more error checking.
3. Upon subsequent CALLs, use the cached Lex.

Note that this implies that the Lex structure with its sphead must be reentrant, that is, reusable and shareable between different threads and calls. The runtime state for a procedure is kept in the sp_rcontext in THD.

The mechanisms of storing, finding, and dropping procedures are encapsulated in the files sp.{cc,h}.

CALLing a Procedure

A CALL is parsed just like any statement. The resulting Lex has the sql_command SQLCOM_CALL, the procedure's name and the parameters are pushed to the Lex' value_list.

sql_parse.cc:mysql_execute_command() then uses sp.cc:sp_find() to get the sp_head for the procedure (which may have been read from the database or fetched from the in-memory cache) and calls the sp_head's method execute().
Note: It's important that substatements called by the procedure do not do send_ok(). Fortunately, there is a flag in THD->net to disable this during CALLs. If a substatement fails, it will however send an error back to the client, so the CALL mechanism must return immediately and without sending an error.

The sp_head::execute() method works as follows:

1. Keep a pointer to the old runtime context in THD (if any)
2. Create a new runtime context. The information about the required size is in sp_head's parse time context.
3. Push each parameter (from the CALL's Lex->value_list) to the new context. If it's an OUT or INOUT parameter, the parameter's offset in the caller's frame is set in the new context as well.
4. For each instruction, call its execute() method.
   The result is a pointer to the next instruction to execute (or NULL) if an error occurred.
5. On success, set the new values of the OUT and INOUT parameters in the caller's frame.

USE database

Before executing the instruction we also keeps the current default database (if any). If this was changed during execution (i.e. a USE statement has been executed), we restore the current database to the original.

This is the most useful way to handle USE in procedures. If we didn't, the caller would find himself in a different database after calling a function, which can be confusing.
Restoring the database also gives full freedom to the procedure writer:

- It's possible to write "general" procedures that are independent of the actual database name.
- It's possible to write procedures that work on a particular database by calling USE, without having to use fully qualified table names everywhere (which doesn't help if you want to call other, "general", procedures anyway).

Evaluating Items

There are three occasions where we need to evaluate an expression:

- When setting a variable
- When calling a procedure
- When testing an expression for a branch (in IF, WHILE, etc)

The semantics in stored procedures is “call-by-value”, so we have to evaluate any “func” Items at the point of the CALL or SET, otherwise we would get a kind of “lazy” evaluation with unexpected results with respect to OUT parameters for instance.
For this the support function, `sp_head.cc:eval_func_item()` is needed.

Calling a FUNCTION

Functions don’t have an explicit call keyword like procedures. Instead, they appear in expressions with the conventional syntax “fun(arg, …)”.
The problem is that we already have User Defined Functions (UDFs) which are called the same way. A UDF is detected by the lexical analyzer (not the parser!), in the `find_keyword()` function, and returns a `UDF_*_FUNC` or `UDA_*_SUM` token with the `udf_func` object as the yylval.

So, stored functions must be handled in a similar way, and as a consequence, UDFs and functions must not have the same name.

Detecting and Parsing a FUNCTION Invocation

The existence of UDFs are checked during the lexical analysis (in sql_lex.cc:find_keyword()). This has the drawback that they must exist before they are referred to, which was ok before SPs existed, but then it becomes a problem.
The first implementation of SP FUNCTIONs will work the same way, but this should be fixed a.s.a.p. (This will required some reworking of the way UDFs are handled, which is why it’s not done from the start.)
For the time being, a FUNCTION is detected the same way, and returns the token SP_FUNC. During the parsing we only check for the *existence* of the function, we don’t parse it, since wa can’t call the parser recursively.

When encountering a SP_FUNC with parameters in the expression parser, an instance of the new Item_func_sp class is created. Unlike UDFs, we don’t have different classes for different return types, since we at this point don’t know the type.

Collecting FUNCTIONs to invoke

A FUNCTION differs from a PROCEDURE in one important aspect: Whereas a PROCEDURE is CALLed as statement by itself, a FUNCTION is invoked “on-the-fly” during the execution of *another* statement.
This makes things a lot more complicated compared to CALL:

- We can’t read and parse the FUNCTION from the mysql.proc table at the point of invocation; the server requires that all tables used are opened and locked at the beginning of the query execution.
  One “obvious” solution would be to simply push “mysql.proc” to the list of tables used by the query, but this implies a “join” with this table if the query is a select, so it doesn’t work (and we can’t exclude this table easily; since a privileged used might in fact want to search the proc table).
  Another solution would of course be to allow the opening and closing of the mysql.proc table during a query execution, but this it not possible at the present.

So, the solution is to collect the names of the referred FUNCTIONs during parsing in the lex.
Then, before doing anything else in `mysql_execute_command()`, read all functions from the database an keep them in the THD, where the function `sp_find_function()` can find them during the execution.
Note: Even with an in-memory cache, we must still make sure that the functions are indeed read and cached at this point.
The code that read and cache functions from the database must also be invoked recursively for each read FUNCTION to make sure we have *all* the functions we need.

Parsing DROP PROCEDURE/FUNCTION

The procedure name is pushed to Lex->value_list.
The sql_command code for the result of parsing a is `SQLCOM_DROP_PROCEDURE` / `SQLCOM_DROP_FUNCTION`.

Dropping is done by simply getting the procedure with the sp_find() function and calling `sp_drop()` (both in `sp.{cc,h}`).

DROP PROCEDURE/DROP FUNCTION also supports the non-standard "IF EXISTS", analogous to other DROP statements in MariaDB.

Condition and Handlers

Condition names are lexical entities and are kept in the parser context just like variables. But, condition are just "aliases" for SQLSTATE strings, or mysqld error codes (which is a non-standard extension in MySQL), and are only used during parsing.

Handlers comes in three types, CONTINUE, EXIT and UNDO. The latter is like an EXIT handler with an implicit rollback, and is currently not implemented.
The EXIT handler jumps to the end of its BEGIN-END block when finished.
The CONTINUE handler returns to the statement following that which invoked the handler.

The handlers in effect at any point is part of each thread's runtime state, so we need to push and pop handlers in the sp_rcontext during execution. We use special instructions for this:

- sp_instr_hpush_jump
  Push a handler. The instruction contains the necessary information, like which conditions we handle and the location of the handler.
  The jump takes us to the location after the handler code.
- sp_instr_hpop
  Pop the handlers of the current frame (which we are just leaving).

It might seems strange to jump past the handlers like that, but there's no extra cost in doing this, and for technical reasons it's easiest for the parser to generate the handler instructions when they occur in the source.

When an error occurs, one of the error routines is called and an error message is normally sent back to the client immediately.
Catching a condition must be done in these error routines (there are quite a few) to prevent them from doing this. We do this by calling a method in the THD's sp_rcontext (if there is one). If a handler is found, this is recorded in the context and the routine returns without sending the error message.
The execution loop (sp_head::execute()) checks for this after each statement and invokes the handler that has been found. If several errors or warnings occurs during one statement, only the first is caught, the rest are ignored.

Invoking and returning from a handler is trivial in the EXIT case.
We simply jump to it, and it will have an sp_instr_jump as its last instruction.

Calling and returning from a CONTINUE handler poses some special problems. Since we need to return to the point after its invocation, we push the return location on a stack in the sp_rcontext (this is done by the execution loop). The handler then ends with a special instruction, sp_instr_hreturn, which returns to this location.

CONTINUE handlers have one additional problem: They are parsed at the lexical level where they occur, so variable offsets will assume that it's actually called at that level. However, a handler might be invoked from a sub-block where additional local variables have been declared, which will then share the location of any local variables in the handler itself. So, when calling a CONTINUE handler, we need to save any local variables above the handler's frame offset, and restore them upon return. (This is not a problem for EXIT handlers, since they will leave the block anyway.)
This is taken care of by the execution loop and the sp_instr_hreturn instruction.

Examples

EXIT handler:

```
begin
        declare x int default 0;

        begin
          declare exit handler for 'XXXXX' set x = 1;

          (statement1);
          (statement2);
        end;
        (statement3);
      end
```

```
Pos.  Instruction
       0    sp_instr_set(0, '0')
       1    sp_instr_hpush_jump(4, 1)           # location and frame size
       2    sp_instr_set(0, '1')
       3    sp_instr_jump(6)
       4    sp_instr_stmt('statement1')
       5    sp_instr_stmt('statement2')
       6    sp_instr_hpop(1)
       7    sp_instr_stmt('statement3')
```

CONTINUE handler:

```
CREATE PROCEDURE hndlr1(val INT)
      BEGIN
        DECLARE x INT DEFAULT 0;
        DECLARE foo CONDITION FOR 1146;
        DECLARE CONTINUE HANDLER FOR foo SET x = 1;

        INSERT INTO t3 VALUES ("hndlr1", val);     # Non-existing table?
        IF x>0 THEN
          INSERT INTO t1 VALUES ("hndlr1", val);   # This instead then
        END IF;
      END|
```

```
Pos.  Instruction
       0    sp_instr_set(1, '0')
       1    sp_instr_hpush_jump(4, 2)
       2    sp_instr_set(1, '1')
       3    sp_instr_hreturn(2)                 # frame size
       4    sp_instr_stmt('insert ... t3 ...')
       5    sp_instr_jump_if_not(7, 'x>0')
       6    sp_instr_stmt('insert ... t1 ...')
       7    sp_instr_hpop(2)
```

Cursors

For stored procedures to be really useful, you want to have cursors.
MySQL doesn't yet have "real" cursor support (with API and ODBC support, allowing updating, arbitrary scrolling, etc), but a simple asensitive, non-scrolling, read-only cursor can be implemented in SPs using the class Protocol_cursor.
This class intecepts the creation and sending of results sets and instead stores it in-memory, as MYSQL_FIELDS and MYSQL_ROWS (as in the client API).

To support this, we need the usual name binding support in sp_pcontext (similar to variables and conditions) to keep track on declared cursor names, and a corresponding run-time mechanism in sp_rcontext.
Cursors are lexically scoped like everything with a body or BEGIN/END block, so they are pushed and popped as

usual (see conditions and variables above).
The basic operations on a cursor are OPEN, FETCH and CLOSE, which will each have a corresponding instruction. In addition, we need instructions to push a new cursor (this will encapsulate the LEX of the SELECT statement of the cursor), and a pop instruction:

- sp_instr_cpush
  Push a cursor to the sp_rcontext. This instruction contains the LEX for the select statement
- sp_instr_cpop
  Pop a number of cursors from the sp_rcontext.
- sp_instr_copen
  Open a cursor: This will execute the select and get the result set in a separate memroot.
- sp_instr_cfetch
  Fetch the next row from the in-memory result set. The instruction contains a list of the variables (frame offsets) to set.
- sp_instr_cclose
  Free the result set.

A cursor is a separate class, sp_cursor (defined in sp_rcontex.h) which encapsulates the basic operations used by the above instructions.
This class contains the LEX, Protocol_cursor object, and its memroot, as well as the cursor's current state.
Compiling and executing is fairly straight-forward. sp_instr_copen is a subclass of sp_instr_stmt and uses its mechanism to execute a substatement.

Example

```
begin
        declare x int;
        declare c cursor for select a from t1;

        open c;
        fetch c into x;
        close c;
      end
```

```
Pos.  Instruction
       0    sp_instr_cpush('select a from ...')
       1    sp_instr_copen(0)                  # The 0'th cursor
       2    sp_instr_cfetch(0)                 # Contains the variable list
       3    sp_instr_cclose(0)
       4    sp_instr_cpop(1)
```

The SP cache

There are two ways to cache SPs:

1. one global cache, share by all threads/connections,
2. one cache per thread.

There are pros and cons with both methods:

1.

- Pros: Save memory, each SP only read from table once,
- Cons: Needs locking (= serialization at access), requires thread-safe data structures,

1.

- Pros: Fast, no locking required (almost), limited thread-safe requirement,

- Cons: Uses more memory, each SP read from table once per thread.

Unfortunately, we cannot use alternative 1 for the time being, as most of the data structures to be cached (lex and items) are not reentrant and thread-safe. (Things are modified at execution, we have THD pointers stored everywhere, etc.)
This leaves us with alternative 2, one cache per thread; or actually two, since we keep FUNCTIONs and PROCEDUREs in separate caches.
This is not that terrible; the only case when it will perform significantly worse than a global cache is when we have an application where new threads are connecting, calling a procedure, and disconnecting, over and over again.

The cache implementation itself is simple and straightforward, a hashtable wrapped in a class and a C API (see APIs below).

There is however one issue with multiple caches: dropping and altering procedures. Normally, this should be a very rare event in a running system; it's typically something you do during development and testing, so it's not unthinkable that we would simply ignore the issue and let any threads running with a cached version of an SP keep doing so until its disconnected.
But assuming we want to keep the caches consistent with respect to drop and alter, it can be done:

1. A global counter is needed, initialized to 0 at start.
2. At each DROP or ALTER, increase the counter by one.
3. Each cache has its own copy of the counter, copied at the last read.
4. When looking up a name in the cache, first check if the global counter is larger than the local copy.
   If so, clear the cache and return "not found", and update the local counter; otherwise, lookup as usual.

This minimizes the cost to a single brief lock for the access of an integer when operating normally. Only in the event of an actual drop or alter, is the cache cleared. This may seem to be drastic, but since we assume that this is a rare event, it's not a problem.
It would of course be possible to have a much more fine-grained solution, keeping track of each SP, but the overhead of doing so is not worth the effort.

Class and Function APIs

This is an outline of the key types. Some types and other details in the actual files have been omitted for readability.

The parser context: sp_pcontext.h

```
typedef enum
      {
        sp_param_in,
        sp_param_out,
        sp_param_inout
      } sp_param_mode_t;

      typedef struct
      {
        LEX_STRING name;
        enum enum_field_types type;
        sp_param_mode_t mode;
        uint offset;                    // Offset in current frame
        my_bool isset;
      } sp_pvar_t;

      typedef struct sp_cond_type
      {
        enum { number, state, warning, notfound, exception } type;
        char sqlstate[6];
        uint mysqlerr;
      } sp_cond_type_t;

      class sp_pcontext
      {
        sp_pcontext();

        // Return the maximum frame size
        uint max_framesize();

        // Return the current frame size
        uint current_framesize();

        // Return the number of parameters
        uint params();

        // Set the number of parameters to the current frame size
        void set_params();

        // Set type of the variable at offset 'i' in the frame
        void set_type(uint i, enum enum_field_types type);

        // Mark the i:th variable to "set" (i.e. having a value) with
        // 'val' true.
        void set_isset(uint i, my_bool val);

        // Push the variable 'name' to the frame.
        void push_var(LEX_STRING *name,
                      enum enum_field_types type, sp_param_mode_t mode);

        // Pop 'num' variables from the frame.
        void pop_var(uint num = 1);

        // Find variable by name
        sp_pvar_t *find_pvar(LEX_STRING *name);

        // Find variable by index
        sp_pvar_t *find_pvar(uint i);

        // Push label 'name' of instruction index 'ip' to the label context
        sp_label_t *push_label(char *name, uint ip);

        // Find label 'name' in the context
        sp_label_t *find_label(char *name);

        // Return the last pushed label
        sp_label_t *last_label();
```

```
        // Return and remove the last pushed label.
        sp_label_t *pop_label();

        // Push a condition to the context
        void push_cond(LEX_STRING *name, sp_cond_type_t *val);

        // Pop a 'num' condition from the context
        void pop_cond(uint num);

        // Find a condition in the context
        sp_cond_type_t *find_cond(LEX_STRING *name);

        // Increase the handler count
        void add_handler();

        // Returns the handler count
        uint handlers();

    // Push a cursor
        void push_cursor(LEX_STRING *name);

    // Find a cursor
    my_bool find_cursor(LEX_STRING *name, uint *poff);

    // Pop 'num' cursors
    void pop_cursor(uint num);

    // Return the number of cursors
    uint cursors();
      }
```

Run-time context (call frame): sp_rcontext.h:

```
#define SP_HANDLER_NONE      0
    #define SP_HANDLER_EXIT      1
    #define SP_HANDLER_CONTINUE  2
    #define SP_HANDLER_UNDO      3

    typedef struct
    {
      struct sp_cond_type *cond;
      uint handler;             // Location of handler
      int type;
      uint foffset;             // Frame offset for the handlers declare level
    } sp_handler_t;

    class sp_rcontext
    {
      // 'fsize' is the max size of the context, 'hmax' the number of handlers,
      // 'cmax' the number of cursors
      sp_rcontext(uint fsize, uint hmax, , uint cmax);

      // Push value (parameter) 'i' to the frame
      void push_item(Item *i);

      // Set slot 'idx' to value 'i'
      void set_item(uint idx, Item *i);

      // Return the item in slot 'idx'
      Item *get_item(uint idx);

      // Set the "out" index 'oidx' for slot 'idx. If it's an IN slot,
      // use 'oidx' -1.
      void set_oindex(uint idx, int oidx);

      // Return the "out" index for slot 'idx'
      int get_oindex(uint idx);

      // Set the FUNCTION result
      void set_result(Item *i);

      // Get the FUNCTION result
      Item *get_result();

      // Push handler at location 'h' for condition 'cond'. 'f' is the
      // current variable frame size.
      void push_handler(sp_cond_type_t *cond, uint h, int type, uint f);

      // Pop 'count' handlers
      void pop_handlers(uint count);

      // Find a handler for this error. This sets the state for a found
      // handler in the context. If called repeatedly without clearing,
      // only the first call's state is kept.
      int find_handler(uint sql_errno);

      // Returns 1 if a handler has been found, with '*ip' and '*fp' set
      // to the handler location and frame size respectively.
      int found_handler(uint *ip, uint *fp);

      // Clear the found handler state.
      void clear_handler();

      // Push a return address for a CONTINUE handler
      void push_hstack(uint ip);

      // Pop the CONTINUE handler return stack
      uint pop_hstack();

      // Save variables from frame index 'fp' and up.
      void save_variables(uint fp);
```

```
    // Restore saved variables from to frame index 'fp' and up.
    void restore_variables(uint fp);

    // Push a cursor for the statement (lex)
    void push_cursor(LEX *lex);

    // Pop 'count' cursors
    void pop_cursors(uint count);

    // Pop all cursors
    void pop_all_cursors();

    // Get the 'i'th cursor
    sp_cursor *get_cursor(uint i);

  }
```

The procedure: sp_head.h:

```
#define TYPE_ENUM_FUNCTION  1
      #define TYPE_ENUM_PROCEDURE 2

      class sp_head
      {
        int m_type;             // TYPE_ENUM_FUNCTION or TYPE_ENUM_PROCEDURE

        sp_head();

        void init(LEX_STRING *name, LEX *lex, LEX_STRING *comment, char suid);

        // Store this procedure in the database. This is a wrapper around
        // the function sp_create_procedure().
        int create(THD *);

        // Invoke a FUNCTION
        int
        execute_function(THD *thd, Item **args, uint argcount, Item **resp);

        // CALL a PROCEDURE
        int
        execute_procedure(THD *thd, List<Item> *args);

        // Add the instruction to this procedure.
        void add_instr(sp_instr *);

        // Returns the number of instructions.
        uint instructions();

        // Returns the last instruction
        sp_instr *last_instruction();

        // Resets lex in 'thd' and keeps a copy of the old one.
        void reset_lex(THD *);

        // Restores lex in 'thd' from our copy, but keeps some status from the
        // one in 'thd', like ptr, tables, fields, etc.
        void restore_lex(THD *);

        // Put the instruction on the backpatch list, associated with
        // the label.
        void push_backpatch(sp_instr *, struct sp_label *);

        // Update all instruction with this label in the backpatch list to
        // the current position.
        void backpatch(struct sp_label *);

        // Returns the SP name (with optional length in '*lenp').
        char *name(uint *lenp = 0);

        // Returns the result type for a function
        Item_result result();

        // Sets various attributes
        void sp_set_info(char *creator, uint creatorlen,
                         longlong created, longlong modified,
                         bool suid, char *comment, uint commentlen);
      }
```

Instructions

The base class

```
class sp_instr
        {
          // 'ip' is the index of this instruction
          sp_instr(uint ip);

          // Execute this instruction.
          // '*nextp' will be set to the index of the next instruction
          // to execute. (For most instruction this will be the
          // instruction following this one.)
          // Returns 0 on success, non-zero if some error occurred.
          virtual int execute(THD *, uint *nextp)
        }
<<code>>

===== Statement instruction
<<code>>
        class sp_instr_stmt : public sp_instr
        {
          sp_instr_stmt(uint ip);

          int execute(THD *, uint *nextp);

          // Set the statement's Lex
          void set_lex(LEX *);

          // Return the statement's Lex
          LEX *get_lex();
        }
```

SET instruction

```
class sp_instr_set : public sp_instr
        {
          // 'offset' is the variable's frame offset, 'val' the value,
          // and 'type' the variable type.
          sp_instr_set(uint ip,
                       uint offset, Item *val, enum enum_field_types type);

          int execute(THD *, uint *nextp);
        }
```

Unconditional jump

```
class sp_instr_jump : public sp_instr
        {
          // No destination, must be set.
          sp_instr_jump(uint ip);

          // 'dest' is the destination instruction index.
          sp_instr_jump(uint ip, uint dest);

          int execute(THD *, uint *nextp);

          // Set the destination instruction 'dest'.
          void set_destination(uint dest);
        }
```

Conditional jump

```
class sp_instr_jump_if_not : public sp_instr_jump
        {
          // Jump if 'i' evaluates to false. Destination not set yet.
          sp_instr_jump_if_not(uint ip, Item *i);

          // Jump to 'dest' if 'i' evaluates to false.
          sp_instr_jump_if_not(uint ip, Item *i, uint dest)

          int execute(THD *, uint *nextp);
        }
```

Return a function value

```
class sp_instr_freturn : public sp_instr
        {
          // Return the value 'val'
          sp_instr_freturn(uint ip, Item *val, enum enum_field_types type);

          int execute(THD *thd, uint *nextp);
        }
```

Push a handler and jump

```
class sp_instr_hpush_jump : public sp_instr_jump
        {
          // Push handler of type 'htype', with current frame size 'fp'
          sp_instr_hpush_jump(uint ip, int htype, uint fp);

          int execute(THD *thd, uint *nextp);

          // Add condition for this handler
          void add_condition(struct sp_cond_type *cond);
        }
```

Pops handlers

```
class sp_instr_hpop : public sp_instr
        {
          // Pop 'count' handlers
          sp_instr_hpop(uint ip, uint count);

          int execute(THD *thd, uint *nextp);
        }
```

Return from a CONTINUE handler

```
class sp_instr_hreturn : public sp_instr
        {
          // Return from handler, and restore variables to 'fp'.
          sp_instr_hreturn(uint ip, uint fp);

          int execute(THD *thd, uint *nextp);
        }
```

Push a CURSOR

```
class sp_instr_cpush : public sp_instr_stmt
    {
          // Push a cursor for statement 'lex'
      sp_instr_cpush(uint ip, LEX *lex)

      int execute(THD *thd, uint *nextp);
        }
```

Pop CURSORs

```
class sp_instr_cpop : public sp_instr_stmt
    {
          // Pop 'count' cursors
      sp_instr_cpop(uint ip, uint count)

      int execute(THD *thd, uint *nextp);
        }
```

Open a CURSOR

```
class sp_instr_copen : public sp_instr_stmt
    {
          // Open the 'c'th cursor
      sp_instr_copen(uint ip, uint c);

      int execute(THD *thd, uint *nextp);
        }
```

Close a CURSOR

```
class sp_instr_cclose : public sp_instr
    {
          // Close the 'c'th cursor
      sp_instr_cclose(uint ip, uint c);

      int execute(THD *thd, uint *nextp);
        }
```

Fetch a row with CURSOR

```
class sp_instr_cfetch : public sp_instr
    {
          // Fetch next with the 'c'th cursor
      sp_instr_cfetch(uint ip, uint c);

      int execute(THD *thd, uint *nextp);

      // Add a target variable for the fetch
      void add_to_varlist(struct sp_pvar *var);
        }
```

Utility functions: sp.h

```
#define SP_OK                0
      #define SP_KEY_NOT_FOUND     -1
      #define SP_OPEN_TABLE_FAILED -2
      #define SP_WRITE_ROW_FAILED  -3
      #define SP_DELETE_ROW_FAILED -4
      #define SP_GET_FIELD_FAILED  -5
      #define SP_PARSE_ERROR       -6

      // Finds a stored procedure given its name. Returns NULL if not found.
      sp_head *sp_find_procedure(THD *, LEX_STRING *name);

      // Store the procedure 'name' in the database. 'def' is the complete
      // definition string ("create procedure ...").
      int sp_create_procedure(THD *,
                              char *name, uint namelen,
                              char *def, uint deflen,
                              char *comment, uint commentlen, bool suid);

      // Drop the procedure 'name' from the database.
      int sp_drop_procedure(THD *, char *name, uint namelen);

      // Finds a stored function given its name. Returns NULL if not found.
      sp_head *sp_find_function(THD *, LEX_STRING *name);

      // Store the function 'name' in the database. 'def' is the complete
      // definition string ("create function ...").
      int sp_create_function(THD *,
                             char *name, uint namelen,
                             char *def, uint deflen,
                             char *comment, uint commentlen, bool suid);

      // Drop the function 'name' from the database.
      int sp_drop_function(THD *, char *name, uint namelen);
```

The cache: sp_cache.h

```
/* Initialize the SP caching once at startup */
      void sp_cache_init();

      /* Clear the cache *cp and set *cp to NULL */
      void sp_cache_clear(sp_cache **cp);

      /* Insert an SP to cache. If **cp points to NULL, it's set to a
         new cache */
      void sp_cache_insert(sp_cache **cp, sp_head *sp);

      /* Lookup an SP in cache */
      sp_head *sp_cache_lookup(sp_cache **cp, char *name, uint namelen);

      /* Remove an SP from cache */
      void sp_cache_remove(sp_cache **cp, sp_head *sp);
```

The mysql.proc schema

This is the mysql.proc table used in MariaDB 10.4:

```
CREATE TABLE `proc` (
  `db` char(64) CHARACTER SET utf8 COLLATE utf8_bin NOT NULL DEFAULT '',
  `name` char(64) NOT NULL DEFAULT '',
  `type` enum('FUNCTION','PROCEDURE','PACKAGE','PACKAGE BODY') NOT NULL,

Connection Memory Usage

> **Note:**
>
> This page contains background information for MariaDB developers.

When creating a connection, a THD object is created for that connection. This contains all connection information and also caches to speed up queries and avoid frequent malloc() calls.

When creating a new connection, the following malloc() calls are done for the THD:

The following information is the state in MariaDB 10.6.1 when compiled without debugging.

Local Thread Memory

This is part of `select memory_used from information_schema.processlist`.

Amount allocated	Where allocated	Description
26646	THD::THD	Allocation of THD object
256	Statement_map::Statement_map(), my_hash_init(key_memory_prepared_statement_map, &st_hash	Prepared statements
256	my_hash_init(key_memory_prepared_statement_map, &names_hash	Names of used prepared statements
128	wsrep_wfc(), Opt_trace_context(), dynamic_array()	
1024	Diagnostics_area::init(),init_sql_alloc(PSI_INSTRUMENT_ME, &m_warn_root	

Amount allocated	Where allocated	Description
120	Session_sysvars_tracker, global_system_variables.session_track_system_variables	Tracking of changed session variables
280	THD::THD,my_hash_init(key_memory_user_var_entry,&user_vars	
280	THD::THD,my_hash_init(PSI_INSTRUMENT_ME, &sequences	Cache of used sequences
1048	THD::THD, m_token_array= my_malloc(PSI_INSTRUMENT_ME, max_digest_length	
16416	CONNECT::create_thd(), my_net_init(), net_allocate_new_packet()	This is for reading data from the connected user
16416	check_connection(), thd->packet.alloc()	This is for sending data to connected user

Objects Stored in THD->memroot During Connect

Amount allocated	Where allocated	Description
72	send_server_handshake_packet, mpvio->cached_server_packet.pkt=	
64	parse_client_handshake_packet, thd->copy_with_error(…db,db_len)	
32	parse_client_handshake_packet, sctx->user=	
368	ACL_USER::copy(), root=	Allocation of ACL_USER object
56	ACL_USER::copy(), dst->user= safe_lexcstrdup_root(root, user)	
56	ACL_USER::copy()	Allocation of other connect attributes
56	ACL_USER::copy()	
64	ACL_USER::copy()	
64	ACL_USER::copy()	
32	mysql_change_db()	Store current db in THD
48	dbname_cache->insert(db_name)	Store db name in db name cache
40	mysql_change_db(), my_register_filename(db.opt)	Store filename db.opt
8216	load_db_opt(), init_io_cache()	Disk cache for reading db.opt
1112	load_db_opts(), put_dbopts()	Cache default database parameters

Progress Reporting

> **Note:**
>
> This page contains background information for MariaDB developers.

MariaDB supports progress reporting for some long running commands.

What is Progress Reporting?

Progress reporting means that:

- There is a `Progress` column in SHOW PROCESSLIST which shows the total progress (0-100%)
- INFORMATION_SCHEMA.PROCESSLIST has three columns which allow you to see in which process stage we are and how much of that stage is completed:
  - `STAGE`
  - `MAX_STAGE`
  - `PROGRESS` (within current stage).
- The client receives progress messages which it can display to the user to indicate how long the command will take.

We have separate progress reporting for stages because different stages take different amounts of time.

Supported Commands

Currently, the following commands can send progress report messages to the client:

- ALTER TABLE
- CREATE INDEX
- DROP INDEX
- LOAD DATA INFILE (not `LOAD DATA LOCAL INFILE`, as in that case we don't know the size of the file).

Some Aria storage engine operations also support progress messages:

- CHECK TABLE
- REPAIR TABLE
- ANALYZE TABLE
- OPTIMIZE TABLE

Limitations

Although the above commands support progress reporting, there are some limitations to what progress is reported. To be specific, when executing one of these commands against an InnoDB table with ALGORITHM=INPLACE (which is the default in MariaDB 10.0+), progress is only reported during the merge sort phase while reconstructing indexes.

Enabling and Disabling Progress Reporting

`mysqld` (the MariaDB server) automatically sends progress report messages to clients that support the new protocol, using the value of the progress_report_time variable. They are sent every max(`global.progress_report_time` , `progress_report_time`) seconds (by default 5). You can disable the sending of progress report messages to the client by setting either the local variable (affects only the current connection) or the global variable (affects all connections) to `0` .

If the extra column in `SHOW PROCESSLIST` gives you a compatibility problem, you can disable it by starting `mysqld` with the `--old` flag.

Clients Which Support Progress Reporting

- The mariadb command line client
- The `mytop` that comes with MariaDB has a `'%'` column which shows the progress.

Progress Reporting in the mysql Command Line Client

Progress reporting is enabled by default in the mariadb client. You can disable it with `--disable-progress-reports` . It is automatically disabled in batch mode.

When enabled, for every supported command you get a progress report like:

```
ALTER TABLE my_mail ENGINE=aria;
Stage: 1 of 2 'copy to tmp table'  5.37% of stage done
```

This is updated every progress_report_time seconds (the default is 5). If the global `progress_report_time` is higher, this will be used. You can also disable error reporting by setting the variable to `0` .

How to Add Support for Progress Reporting to a Client

You need to use the MariaDB 5.3 or later client library. You can check that the library supports progress reporting by doing:

```
#ifdef CLIENT_PROGRESS
```

To enable progress reporting to the client you need to add `CLIENT_PROGRESS` to the `connect_flag` in `mysql_real_connect()` :

```
mysql_real_connect(mysql, host, user, password,
                   database, opt_mysql_port, opt_mysql_unix_port,
                   connect_flag | CLIENT_PROGRESS);
```

Then you need to provide a callback function for progress reports:

```
static void report_progress(const MYSQL *mysql, uint stage, uint max_stage,
                            double progress, const char *proc_info,
                            uint proc_info_length);

mysql_options(&mysql, MYSQL_PROGRESS_CALLBACK, (void*) report_progress);
```

The above `report_progress` function will be called for each progress message.

This is the implementation used by `mysql.cc` :

```
uint last_progress_report_length;

static void report_progress(const MYSQL *mysql, uint stage, uint max_stage,
                            double progress, const char *proc_info,
                            uint proc_info_length)
{
  uint length= printf("Stage: %d of %d '%.*s' %6.3g%% of stage done",
                      stage, max_stage, proc_info_length, proc_info,
                      progress);
  if (length < last_progress_report_length)
    printf("%*s", last_progress_report_length - length, "");
  putc('\r', stdout);
  fflush(stdout);
  last_progress_report_length= length;
}
```

If you want only one number for the total progress, you can calculate it with:

```
double total_progress=
 ((stage -1) / (double) max_stage * 100.00 + progress / max_stage);
```

Note: `proc_info` is totally independent of stage. You can have many different `proc_info` values within a stage. The idea behind `proc_info` is to give the user more information about what the server is doing.

How to Add Support for Progress Reporting to a Storage Engine

The functions to use for progress reporting are:

```
void thd_progress_init(MYSQL_THD thd, unsigned int max_stage);
```

Initialize progress reporting with stages. This is mainly used for commands that are totally executed within the engine, like `CHECK TABLE`.
You should not use this for operations that could be called by, for example, `ALTER TABLE` as this has already called the function.

`max_stage` is the number of stages your storage engine will have.

```
void thd_progress_report(MYSQL_THD thd, unsigned long long progress,
                         unsigned long long max_progress);
```

The above is used for reporting progress.

- `progress` is how much of the file/rows/keys you have gone through.
- `max_progress` is the max number of rows you will go through.

You can call this with varying numbers, but normally the ratio `progress/max_progress` should be increasing.

This function can be called even if you are not using stages, for example when enabling keys as part of `ALTER TABLE` or `ADD INDEX`.

```
void thd_progress_next_stage(MYSQL_THD thd);
```

To go to the next stage in a multi-stage process initiated by `thd_progress_init()`:

```
void thd_progress_end(MYSQL_THD thd);
```

End progress reporting; Sets 'Progress' back to 0 in `SHOW PROCESSLIST`.

```
const char *thd_proc_info(thd, 'stage name');
```

This sets the name of the current status/stage that is displayed in `SHOW PROCESSLIST` and in the client. It's recommended that you call this between stages and thus before `thd_progress_report()` and `thd_progress_next_stage()`.

This functions returns the last used `proc_info`. It's recommended that you restore `proc_info` to its original value when you are done processing.

Note: `thd_proc_info()` is totally independent of stage. You can have many different `proc_info` values within a stage to give the user more information about what is going on.

Examples to Look at in the MariaDB Source:

- `client/mysql.cc` for an example of how to use reporting.
- `libmysql/client.c:cli_safe_read()` to see how progress packets are handled in client
- `sql/protocol.cc::net_send_progress_packet()` for how progress packets are handled in server.

Format of Progress Packets

The progress packet is sent as an error packet with error number `65535`.

It contains the following data (in addition to the error header):

Option	Number of bytes	Other info
1	1	Number of strings. For future
Stage	1	Stage from 1 - Max_stage
Max_stage	1	Max number of stages
Progress	3	Progress in % * 1000
Status_length	1-2	Packet length of string in net_field_length() format
Status	Status_length	Status / Stage name

Embedded MariaDB Interface

> **Note:**
>
> This page contains background information for MariaDB developers.

The embedded MariaDB server, `libmysqld` has the identical interface as the C client library `libmysqclient`.

The normal usage of the embedded server is to use the normal `mysql.h` include file in your application and link with `libmysqld` instead of `libmysqlclient`.

The intention is that one should be able to move from a server/client version of MariaDB to a single server version of MariaDB by just changing which library you link with.

This means that the embedded C client API only changes when the normal C API changes, usually only between major releases.

The only major change required in your application if you are going to use the embedded server is that you have to call the following functions from your application:

```
int mysql_library_init(int argc, char **argv, char **groups)
void mysql_library_end(void);
```

This is also safe to do when using the standard C library.

Notes

- libmysqld.so has many more exported symbols than the C library to allow one to expose and use more parts of MariaDB. In normal applications one should not use them, as they may change between every release.
- The embedded server library and related test binaries are no longer part of binary tarball release archives.

The mariadb-test and mariadb-test-embedded Programs

> **Note:**
>
> This page contains background information for MariaDB developers.

The `mariadb-test` program runs a test case against a MariaDB or MySQL server and optionally compares the output with a result file. This program reads input written in a special test language. Typically, you invoke `mariadb-test` via mariadb-test-run.pl rather than invoking it directly.

`mariadb-test_embedded` is similar but is built with support for the `libmariadbd` embedded server.

Features of mariadb-test:

- Can send SQL statements to the server for execution
- Can execute external shell commands
- Can test whether the result from an SQL statement or shell command is as expected
- Can connect to one or more standalone mariadbd servers and switch between connections
- Can connect to an embedded server (`libmariadbd`), if MariaDB is compiled with support for `libmariadbd`. (In this case, the executable is named `mariadb-test_embedded` rather than `mariadb-test`.)

By default, `mariadb-test` reads the test case on the standard input. To run mariadb-test this way, you normally invoke it like this:

```
shell> mariadb-test **[options] [db_name]** < //test_file//
```

You can also name the test case file with a `--test-file=file_name` option.

The exit value from `mariadb-test` is `0` for success, `1` for failure, and `62` if it skips the test case (for example, if after checking some preconditions it decides not to run the test).

Options

`mariadb-test` supports the following options:

Option	Description
–help, -?	Display a help message and exit.
–basedir=dir, -b dir	The base directory for tests.
–character-sets-dir=path	The directory where character sets are installed.
–compress, -C	Compress all information sent between the client and the server if both support compression.
–connect-timeout=N	This can be used to set the `MYSQL_OPT_CONNECT_TIMEOUT` parameter of `mysql_options` to change the number of seconds before an unsuccessful connection attempt times out.
–continue-on-error	Continue test even if we got an error. This is mostly useful when testing a storage engine to see what from a test file it can execute, or to find all syntax errors in a newly created big test file
–cursor-protocol	Use cursors for prepared statements.
–database=db_name, -D db_name	The default database to use.
–debug[=debug_options], -#[debug_options]	Write a debugging log if MariaDB is built with debugging support. The default `debug_options` value is `d:t:S:i:O,/tmp/mysqltest.trace` on Unix, and `d:t:i:O,\mysqld.trace` on Windows.
–debug-check	Print some debugging information when the program exits.
–debug-info	Print debugging information and memory and CPU usage statistics when the program exits.
–host=host_name, -h host_name	Connect to the server on the given host.
–logdir=dir_name	The directory to use for log files.

Option	Description
–mark-progress	Write the line number and elapsed time to test_file.progress.
–max-connect-retries=num	The maximum number of connection attempts when connecting to server.
–max-connections=num	The maximum number of simultaneous server connections per client (that is, per test). If not set, the maximum is 128. Minimum allowed limit is 8, maximum is 5120.
–no-defaults	Do not read default options from any option files. If used, this must be the first option.
–non-blocking-api	Use the non-blocking client API for communication.
–overlay-dir=name	Overlay directory.
–password[=password], -p[password]	The password to use when connecting to the server. If you use the short option form (`-p`), you cannot have a space between the option and the password. If you omit the password value following the `--password` or `-p` option on the command line, you are prompted for one.
plugin-dir	Directory for client-side plugins.
–port=port_num, -P port_num	The TCP/IP port number to use for the connection, or `0` for default to, in order of preference, `my.cnf` , `$MYSQL_TCP_PORT` , `/etc/services` , built-in default (`3306`).
–prologue=name	Include the contents of the given file before processing the contents of the test file. The included file should have the same format as other `mariadb-test` test files. This option has the same effect as putting a `--source`` *file_name* command as the first line of the test file.
–protocol=name	The protocol to use for connection (`tcp` , `socket` , `pipe` , `memory`).
–ps-protocol	Use the prepared-statement protocol for communication.
–quiet	Suppress all normal output. This is a synonym for `--silent` .
–record, -r	Record the output that results from running the test file into the file named by the `--result-file` option, if that option is given. It is an error to use this option without also using `--result-file` .
–result-file=file_name, -R file_name	This option specifies the file for test case expected results. `--result-file` , together with `--record` , determines how mariadb-test treats the test actual and expected results for a test case:If the test produces no results, mariadb-test exits with an error message to that effect, unless `--result-file` is given and the named file is an empty file.Otherwise, if `--result-file` is not given, `mariadb-test` sends test results to the standard output. With `--result-file` but not `--record` , `mariadb-test` reads the expected results from the given file and compares them with the actual results. If the results do not match, mariadb-test writes a reject file in the same directory as the result file, outputs a diff of the two files, and exits with an error. With both `--result-file` and `--record` , `mariadb-test` updates the given file by writing the actual test results to it.

Option	Description
–result-format-version=#	Version of the result file format to use.
–server-arg=value, -A value	Pass the argument as an argument to the embedded server. For example, `--server-arg=--tmpdir=/tmp` or `--server-arg=--core`. Up to 64 arguments can be given.
–server-file=file_name, -F file_name	Read arguments for the embedded server from the given file. The file should contain one argument per line.
–shared-memory-base-name	Shared-memory name to use for Windows connections using shared memory to a local server (started with the `--shared-memory` option). Case-sensitive.
–silent, -s	Suppress all normal output.
–sleep=num, -T num	Cause all sleep commands in the test case file to sleep num seconds. This option does not affect real_sleep commands. An option value of `0` can be used, which effectively disables sleep commands in the test case.
–socket=path, -S path	The socket file to use when connecting to localhost (which is the default host).
–sp-protocol	Execute DML statements within a stored procedure. For every DML statement, mariadb-test creates and invokes a stored procedure that executes the statement rather than executing the statement directly.
–ssl	Enable TLS for secure connection (automatically enabled with other flags). Disable with `--skip-ssl`.
–ssl-ca=name	CA file in PEM format (check OpenSSL docs, implies `--ssl`).
–ssl-capath=name	CA directory (check OpenSSL docs, implies `--ssl`).
–ssl-cert=name	X509 cert in PEM format (implies `--ssl`).
–ssl-cipher=name	SSL cipher to use (implies `--ssl`).
–ssl-key=name	X509 key in PEM format (implies `--ssl`).
–ssl-crl=name	Certificate revocation list (implies `--ssl`).

Option	Description
–ssl-crlpath=name	Certificate revocation list path (implies `--ssl`).
–ssl-verify-server-cert	Verify server's "Common Name" in its cert against hostname used when connecting. This option is disabled by default.
–suite-dir=name	Suite directory.
–tail-lines=nn	Specify how many lines of the result to include in the output if the test fails because an SQL statement fails. The default is `0`, meaning no lines of result printed.
–test-file=file_name, -x file_name	Read test input from this file. The default is to read from the standard input.
–timer-file=file_name, -m file_name	If given, the number of microseconds spent running the test will be written to this file. This is used by mariadb-test-run.pl for its reporting.
–tmpdir=dir_name, -t dir_name	The temporary directory where socket files are created.
–user=user_name, -u user_name	The user name to use when connecting to the server.
–verbose, -v	Verbose mode. Print out more information about what the program does.
–version, -V	Display version information and exit.
–view-protocol	Every `SELECT` statement is wrapped inside a view.
–wait-longer-for-timeouts	Wait longer for timeouts. Useful when running under valgrind.

Non-Blocking Operation in the Client Library

> **Note:**
>
> This page contains background information for MariaDB developers.

MariaDB supports *non-blocking* operations in the client library. This allows an application to start a query or other operation against the database, and then continue to do other work (in the same thread) while the request is sent over the network, the query is processed in the server, and the result travels back. As parts of the result become ready, the application can — at its leisure — call back into the library to continue processing, repeating this until the operation is completed.

Non-blocking operation is implemented entirely within the client library. This means no special server support is necessary and non-blocking operation works with any version of the MariaDB or MySQL server, the same as the normal blocking API. It also means that it is not possible to have two queries running at the same time on the same connection (this is a protocol limitation). But a single thread can have any number of non-blocking queries running at the same time, each using its own MYSQL connection object.

Non-blocking operation is useful when an application needs to run a number of independent queries in parallel at the same time, to speed up operation compared to running them sequentially one after the other. This could be multiple queries against a single server (to better utilize multiple CPU cores and/or a high-capacity I/O system on the server), or it could be queries against multiple servers (e.g. SHOW STATUS against all running servers for monitoring, or a map/reduce-like operation against a big sharded database).

Non-blocking operation is also very useful in applications that are already written in a non-blocking style, for example using a framework like libevent, or, for example, a GUI-application using an event loop. Using the non-blocking client library allows the integrations of database queries into such applications, without the risk of long-running queries “hanging” the user interface or stalling the event loop, and without having to manually spawn separate threads to run the queries and re-synchronize with the threads to get the results back.

In this context, “blocking” means the situation where communication on the network socket to the server has to wait while processing the query. Waiting can be necessary because the server has not yet had time to process the query, or because the data needs to travel over the network from the server, or even because the first part of a large request needs to be sent out on the network before local socket buffers can accept the last part. Whenever such a wait is necessary, control returns to the application. The application will then run `select()` or `poll()` (or something similar) to detect when any wait condition is satisfied, and then call back into the library to continue processing.

An example program is available in the MariaDB source tree:

```
tests/async_queries.c
```

It uses `libevent` to run a set of queries in parallel from within a single thread / event loop. This is a good example of how to integrate non-blocking query processing into an event-based framework.

The non-blocking API in the client library is entirely optional. The new library is completely ABI- and source-compatible with existing applications. Also, applications not using non-blocking operations are not affected, nor is there any significant performance penalty for having support for non-blocking operations in the library for applications which do not use them.

The library internally uses co-routines, and requires a co-routine implementation to work. Native implementations are included for i386, amd64, and (since Connector/C version 3.3.12) aarch64 architectures. For other architectures, a fallback to `ucontext` is automatically used if available. An alternate fallback `boost::context` can also be used instead of `ucontext` by building with `-DWITH_BOOST_CONTEXT=ON` (`boost::context` is not used by default). If no co-routine implementation is available, the non-blocking operations are disabled and do not work.

Non-Blocking API Reference

> **Note:**
>
> This page contains background information for MariaDB developers.

Here is a list of all functions in the non-blocking client API and their parameters. Apart from operating in a non-blocking way, they all work exactly the same as their blocking counterparts, so their exact semantics can be obtained from the documentation of the normal client API.

The API also contains the following three functions which are used to get the socket `fd` and `timeout` values when waiting for events to occur:

```
my_socket mysql_get_socket(const MYSQL *mysql)
```

Return the descriptor of the socket used for the connection.

```
unsigned int STDCALL mysql_get_timeout_value(const MYSQL *mysql)
```

This should only be called when a `_start()` or `_cont()` function returns a value with the `MYSQL_WAIT_TIMEOUT` flag set. In this case, it returns the value, in seconds, after which a timeout has occurred and the application should call the appropriate `_cont()` function passing `MYSQL_WAIT_TIMEOUT` as the event that occurred.

This is used to handle connection and read timeouts.

```
unsigned int STDCALL mysql_get_timeout_value_ms(const MYSQL *mysql)
```

Like `mysql_get_timeout_value()`, this should only be called when a `_start()` or `_cont()` function returns a value with the `MYSQL_WAIT_TIMEOUT` flag set. In this case, it returns the value, in milliseconds, after which a timeout has occurred and the application should call the appropriate `_cont()` function passing `MYSQL_WAIT_TIMEOUT` as the event that occurred.

The difference to `mysql_get_timeout_value()` is that this provides millisecond resolution for timeouts, rather than just whole seconds. Internal timeouts can be in milliseconds.

At the end is a list of all functions from the normal API which can be used safely in a non-blocking program, since they never need to block.

```
int mysql_real_connect_start(MYSQL **ret, MYSQL *mysql, const char *host,
                         const char *user, const char *passwd, const char *db,
                         unsigned int port, const char *unix_socket,
                         unsigned long client_flags)
```

```
int mysql_real_connect_cont(MYSQL **ret, MYSQL *mysql, int ready_status)
```

`mysql_real_connect_start()` initiates a non-blocking connection request to a server.

When `mysql_real_connect_start()` or `mysql_real_connect_cont()` returns zero, a copy of the passed '`mysql`' argument is stored in `*ret`.

```
int mysql_real_query_start(int *ret, MYSQL *mysql, const char *stmt_str,
unsigned long length)
int mysql_real_query_cont(int *ret, MYSQL *mysql, int ready_status)
```

```
int mysql_fetch_row_start(MYSQL_ROW *ret, MYSQL_RES *result)
int mysql_fetch_row_cont(MYSQL_ROW *ret, MYSQL_RES *result, int ready_status)
```

Initiate fetch of another row from a `SELECT` query.

If the `MYSQL_RES` was obtained from `mysql_use_result()`, then this function allows stream processing, where initial rows are returned to the application while the server is still sending subsequent rows. When no more data is available on the socket, `mysql_fetch_row_start()` or `mysql_fetch_row_cont()` return `MYSQL_WAIT_READ` (or possibly `MYSQL_WAIT_WRITE` if using TLS and TLS re-negotiation is needed; also `MYSQL_WAIT_TIMEOUT` may be set if read timeout is enabled). When data becomes available, more rows can be fetched with `mysql_fetch_row_cont()`.

If the `MYSQL_RES` was obtained from `mysql_store_result()` or `mysql_store_result_start()` / `mysql_store_result_cont()`, this function cannot block — `mysql_fetch_row_start()` always returns `0` (and if desired, `plain mysql_fetch_row()` may be used instead with equivalent effect).

```
int mysql_set_character_set_start(int *ret, MYSQL *mysql, const char *csname)
int mysql_set_character_set_cont(int *ret, MYSQL *mysql, int ready_status)
```

```
mysql_select_db_start(int *ret, MYSQL *mysql, const char *db)
int mysql_select_db_cont(int *ret, MYSQL *mysql, int ready_status)
```

```
int mysql_send_query_start(int *ret, MYSQL *mysql, const char *q, unsigned long length)
int mysql_send_query_cont(int *ret, MYSQL *mysql, int ready_status)
```

```
int mysql_store_result_start(MYSQL_RES **ret, MYSQL *mysql)
int mysql_store_result_cont(MYSQL_RES **ret, MYSQL *mysql, int ready_status)
```

```
int mysql_free_result_start(MYSQL_RES *result)
int mysql_free_result_cont(MYSQL_RES *result, int ready_status)
```

This function can need to wait if not all rows were fetched before it was called (then it needs to consume any pending rows sent from the server so they do not interfere with any subsequent queries sent).

If all rows were already fetched, then this function does not need to wait. `mysql_free_result_start()` will return zero (or if so desired, plain `mysql_free_result()` may be used instead).

Note that `mysql_free_result()` returns no value, so there is no extra '`ret`' parameter for `mysql_free_result_start()` or `mysql_free_result_cont()`.

```
int mysql_close_start(MYSQL *sock)
int mysql_close_cont(MYSQL *sock, int ready_status)
```

`mysql_close()` sends a `COM_QUIT` request to the server, though it does not wait for any reply.

Thus theoretically it can block (if the socket buffer is full), though in practice it is probably unlikely to occur frequently.

The non-blocking version of `mysql_close()` is provided for completeness; for many applications using the normal `mysql_close()` is probably sufficient (and may be simpler).

Note that `mysql_close()` returns no value, so there is no extra '`ret`' parameter for `mysql_close_start()` or `mysql_close_cont()`.

```
int mysql_change_user_start(my_bool *ret, MYSQL *mysql, const char *user, const
                            char *passwd, const char *db)
int mysql_change_user_cont(my_bool *ret, MYSQL *mysql, int ready_status)
```

```
int mysql_query_start(int *ret, MYSQL *mysql, const char *q)
int mysql_query_cont(int *ret, MYSQL *mysql, int ready_status)
```

```
int mysql_shutdown_start(int *ret, MYSQL *mysql, enum mysql_enum_shutdown_level
                         shutdown_level)
int mysql_shutdown_cont(int *ret, MYSQL *mysql, int ready_status)
```

```
int mysql_dump_debug_info_start(int *ret, MYSQL *mysql)
int mysql_dump_debug_info_cont(int *ret, MYSQL *mysql, int ready_status)
```

```
int mysql_refresh_start(int *ret, MYSQL *mysql, unsigned int refresh_options)
int mysql_refresh_cont(int *ret, MYSQL *mysql, int ready_status)
```

```

```

```
int mysql_stmt_next_result_start(int *ret, MYSQL_STMT *stmt)
int mysql_stmt_next_result_cont(int *ret, MYSQL_STMT *stmt, int ready_status)
```

Client API Functions That Never Block

The following client API functions never need to do I/O and thus can never block. Therefore, they can be used as normal in programs using non-blocking operations; no need to call any special `_start()` variant. (Even if a `_start()` variant was available, it would always return zero, so no `_cont()` call would ever be needed).

- mysql_num_rows()

Using the Non-Blocking Library

> **Note:**
>
> This page contains background information for MariaDB developers.

Overview

The MariaDB non-blocking client API is modeled after the normal blocking library calls. This makes it easy to learn and remember. It makes it easier to translate code from using the blocking API to using the non-blocking API (or vice versa). And it also makes it simple to mix blocking and non-blocking calls in the same code path.

For every library call that may block on socket I/O, such as '`int mysql_real_query(MYSQL, query, query_length)`', two additional non-blocking calls are introduced:

```
int mysql_real_query_start(&status, MYSQL, query, query_length)
int mysql_real_query_cont(&status, MYSQL, wait_status)
```

To do non-blocking operation, an application first calls `mysql_real_query_start()` instead of `mysql_real_query()`, passing the same parameters.

If `mysql_real_query_start()` returns zero, then the operation completed without blocking, and 'status' is set to the value that would normally be returned from `mysql_real_query()`.

Else, the return value from `mysql_real_query_start()` is a bitmask of events that the library is waiting on. This can be `MYSQL_WAIT_READ`, `MYSQL_WAIT_WRITE`, or `MYSQL_WAIT_EXCEPT`, corresponding to the similar flags for `select()` or `poll()`; and it can include `MYSQL_WAIT_TIMEOUT` when waiting for a timeout to occur (e.g. a connection timeout).

In this case, the application continues other processing and eventually checks for the appropriate condition(s) to occur on the socket (or for timeout). When this occurs, the application can resume the operation by calling `mysql_real_query_cont()`, passing in `'wait_status'` a bitmask of the events which actually occurred.

Just like `mysql_real_query_start()`, `mysql_real_query_cont()` returns zero when done, or a bitmask of events it needs to wait on. Thus the application continues to repeatedly call `mysql_real_query_cont()`, intermixed with other processing of its choice; until zero is returned, after which the result of the operation is stored in `'status'`.

Some calls, like `mysql_option()`, do not do any socket I/O, and so can never block. For these, there are no separate `_start()` or `_cont()` calls. See the "Non-blocking API reference" page for a full list of what functions can and can not block.

The checking for events on the socket / timeout can be done with `select()` or `poll()` or a similar mechanism. Though often it will be done using a higher-level framework (such as libevent), which supplies facilities for registering and acting on such conditions.

The descriptor of the socket on which to check for events can be obtained by calling `mysql_get_socket()`. The duration of any timeout can be obtained from `mysql_get_timeout_value()`.

Here is a trivial (but full) example of running a query with the non-blocking API. The example is found in the MariaDB source tree as `client/async_example.c`. A larger, more realistic example using `libevent` is found as `tests/async_queries.c` in the source code:

```
static void run_query(const char *host, const char *user, const char *password) {
  int err, status;
  MYSQL mysql, *ret;
  MYSQL_RES *res;
  MYSQL_ROW row;

  mysql_init(&mysql);
  mysql_options(&mysql, MYSQL_OPT_NONBLOCK, 0);

  status = mysql_real_connect_start(&ret, &mysql, host, user, password, NULL, 0, NULL, 0);
  while (status) {
    status = wait_for_mysql(&mysql, status);
    status = mysql_real_connect_cont(&ret, &mysql, status);
  }

  if (!ret)
    fatal(&mysql, "Failed to mysql_real_connect()");

  status = mysql_real_query_start(&err, &mysql, SL("SHOW STATUS"));
  while (status) {
    status = wait_for_mysql(&mysql, status);
    status = mysql_real_query_cont(&err, &mysql, status);
  }
  if (err)
    fatal(&mysql, "mysql_real_query() returns error");

  /* This method cannot block. */
  res= mysql_use_result(&mysql);
  if (!res)
    fatal(&mysql, "mysql_use_result() returns error");

  for (;;) {
    status= mysql_fetch_row_start(&row, res);
    while (status) {
      status= wait_for_mysql(&mysql, status);
      status= mysql_fetch_row_cont(&row, res, status);
    }
    if (!row)
      break;
    printf("%s: %s\n", row[0], row[1]);
  }
  if (mysql_errno(&mysql))
    fatal(&mysql, "Got error while retrieving rows");
  mysql_free_result(res);
  mysql_close(&mysql);
}

/* Helper function to do the waiting for events on the socket. */
static int wait_for_mysql(MYSQL *mysql, int status) {
  struct pollfd pfd;
  int timeout, res;

  pfd.fd = mysql_get_socket(mysql);
  pfd.events =
    (status & MYSQL_WAIT_READ ? POLLIN : 0) |
    (status & MYSQL_WAIT_WRITE ? POLLOUT : 0) |
    (status & MYSQL_WAIT_EXCEPT ? POLLPRI : 0);
  if (status & MYSQL_WAIT_TIMEOUT)
    timeout = 1000*mysql_get_timeout_value(mysql);
  else
    timeout = -1;
  res = poll(&pfd, 1, timeout);
  if (res == 0)
    return MYSQL_WAIT_TIMEOUT;
  else if (res < 0)
    return MYSQL_WAIT_TIMEOUT;
  else {
    int status = 0;
```

```
    if (pfd.revents & POLLIN) status |= MYSQL_WAIT_READ;
    if (pfd.revents & POLLOUT) status |= MYSQL_WAIT_WRITE;
    if (pfd.revents & POLLPRI) status |= MYSQL_WAIT_EXCEPT;
    return status;
  }
}
```

Setting MYSQL_OPT_NONBLOCK

Before using any non-blocking operation, it is necessary to enable it first by setting the `MYSQL_OPT_NONBLOCK` option:

```
mysql_options(&mysql, MYSQL_OPT_NONBLOCK, 0);
```

This call can be made at any time — typically it is done at the start, before `mysql_real_connect()`, but it can be done at any time to start using non-blocking operations.

If a non-blocking operation is attempted without setting the `MYSQL_OPT_NONBLOCK` option, the program will typically crash with a `NULL` pointer exception.

The argument for `MYSQL_OPT_NONBLOCK` is the size of the stack used to save the state of a non-blocking operation while it is waiting for I/O and the application is doing other processing. Normally, applications will not have to change this, and it can be passed as zero to use the default value.

Mixing Blocking and Non-Blocking Operation

It is possible to freely mix blocking and non-blocking calls on the same `MYSQL` connection.

Thus, an application can do a normal blocking `mysql_real_connect()` and subsequently do a non-blocking `mysql_real_query_start()`. Or vice versa, do a non-blocking `mysql_real_connect_start()`, and later do a blocking `mysql_real_query()` on the resulting connection.

Mixing can be useful to allow code to use the simpler blocking API in parts of the program where waiting is not a problem. For example establishing the connection(s) at program startup, or doing small quick queries between large, long-running ones.

The only restriction is that any previous non-blocking operation must have finished before starting a new blocking (or non-blocking) operation, see the next section for more.

Terminating a Non-Blocking Operation Early

When a non-blocking operation is started with `mysql_real_query_start()` or another `_start()` function, it must be allowed to finish before starting a new operation. Thus, the application must continue calling `mysql_real_query_cont()` until zero is returned, indicating that the operation is completed. It is not allowed to leave one operation “hanging” in the middle of processing and then start a new one on top of it.

It is, however, permissible to terminate the connection completely with `mysql_close()` in the middle of processing a non-blocking call. A new connection must then be initiated with `mysql_real_connect` before new queries can be run, either with a new `MYSQL` object or reusing the old one.

In the future, we may implement an abort facility to force an on-going operation to terminate as quickly as possible (but it will still be necessary to call `mysql_real_query_cont()` one last time after abort, allowing it to clean up the operation and return immediately with an appropriate error code).

Restrictions

DNS

When `mysql_real_connect_start()` is passed a hostname (as opposed to a local unix socket or an IP address, it may need to look up the hostname in DNS, depending on local host configuration (e.g. if the name is not in `/etc/hosts` or cached). Such DNS lookups do **not** happen in a non-blocking way. This means that `mysql_real_connect_start()` will not return control to the application while waiting for the DNS response. Thus the application may "hang" for some time if DNS is slow or non-functional.

If this is a problem, the application can pass an IP address to `mysql_real_connect_start()` instead of a hostname, which avoids the problem.
The IP address can be obtained by the application with whatever non-blocking DNS lookup operation is available to it from the operating system or event framework used. Alternatively, a simple solution may be to just add the hostname to the local host lookup file (`/etc/hosts` on Posix/Unix/Linux machines).

Windows Named Pipes and Shared Memory Connections

There is no support in the non-blocking API for connections using Windows named pipes or shared memory.

Named pipes and shared memory can still be used, using either the blocking or the non-blocking API. However, operations that need to wait on I/O on the named pipe do not return control to the application; instead they "hang", waiting for the operation to complete, just like the normal blocking API calls.

5. regular expression↩
6. Key Management System↩
7. Forced Unit Access (FUA) is a feature in storage systems that ensures data is written directly to stable, non-volatile storage before a write command is acknowledged as complete.
   It is implemented as a flag in I/O commands, such as SCSI and SATA commands, and is used to bypass the device's write cache, guaranteeing that data is physically written to the storage medium.
   When the FUA bit is set to 1, the storage device must complete the write operation to the physical media before returning a "good" status, ensuring data durability even in the event of a power failure.↩
8. Direct Memory Access; see https://en.wikipedia.org/wiki/Direct_memory_access for details.↩
9. NUMA (Non-Uniform Memory Access): A hardware architecture where a processor accesses its own local memory faster than non-local memory, requiring database optimization for efficiency.↩
10. RLIMIT_AS stands for Resource Limit: Address Space. It is one of the "ulimits" (user limits) that a system administrator can set to prevent a single process from going rogue.↩
11. ACID compliance refers to a set of properties—Atomicity, Consistency, Isolation, and Durability—that ensure database transactions are processed reliably and maintain data integrity.
    Atomicity guarantees that a transaction is treated as a single, indivisible unit, where all operations succeed or the entire transaction is rolled back.
    Consistency ensures that a transaction brings the database from one valid state to another, adhering to all defined rules and constraints.
    Isolation mandates that concurrent transactions do not interfere with each other, preserving data accuracy during simultaneous operations.
    Durability ensures that once a transaction is committed, its changes are permanently stored and survive system failures such as crashes or power outages.
    These properties are essential for mission-critical applications in industries like banking, healthcare, and e-commerce, where data accuracy

and reliability are paramount.
While ACID compliance enhances data integrity and user confidence, it can impact performance, particularly under high load, due to the overhead of maintaining strict consistency and concurrency control.
Some modern systems, such as data warehouses, may relax isolation requirements to improve read performance, though they still typically maintain atomicity, consistency, and durability.↩

12. NUMA (Non-Uniform Memory Access): A hardware architecture where a processor accesses its own local memory faster than non-local memory, requiring database optimization for efficiency.↩
13. NUMA (Non-Uniform Memory Access): A hardware architecture where a processor accesses its own local memory faster than non-local memory, requiring database optimization for efficiency.↩
14. DML (Data Manipulation Language): The subset of SQL commands used to add, modify, retrieve, or delete data within existing database tables.↩
15. Database Management System. Popular DBMSs include MariaDB, MySQL, Oracle, PostgreSQL, and MongoDB.↩
16. DDL (Data Definition Language): The subset of SQL commands used to create, modify, or destroy the structure of database objects (like tables, indexes, and databases) rather than the data itself.↩
17. **DDL (Data Definition Language)** is the part of SQL used to **define and change the structure of database objects**.

    It covers operations like:

    - Creating and removing objects: `CREATE`, `DROP`
    - Changing object definitions: `ALTER`
    - Clearing data while keeping the table structure: `TRUNCATE`

    DDL affects **schema metadata** (tables, columns, indexes, constraints, views), not day-to-day row updates like `INSERT` / `UPDATE` / `DELETE`.↩
18. **DBA (Database Administrator)** is the person (or role) responsible for **operating and maintaining databases**.

    Typical DBA work includes **user access**, **backups and recovery**, **performance tuning**, **monitoring**, and **schema changes**.↩
19. In databases, change data capture (CDC) is a set of software design patterns used to determine and track the data that has changed (the “deltas”) so that action can be taken using the changed data. The result is a delta-driven dataset.↩
20. DML (Data Manipulation Language): The subset of SQL commands used to add, modify, retrieve, or delete data within existing database tables.↩
21. DDL (Data Definition Language): The subset of SQL commands used to create, modify, or destroy the structure of database objects (like tables, indexes, and databases) rather than the data itself.↩
22. DDL (Data Definition Language): The subset of SQL commands used to create, modify, or destroy the structure of database objects (like tables, indexes, and databases) rather than the data itself.↩
23. DML (Data Manipulation Language): The subset of SQL commands used to add, modify, retrieve, or delete data within existing database tables.↩
24. DML (Data Manipulation Language): The subset of SQL commands used to add, modify, retrieve, or delete data within existing database tables.↩
25. I/O almost always refers to Disk I/O. Reading from and writing to storage is significantly slower than processing data in RAM. Therefore, excessive logging or poorly indexed queries increase “I/O Wait,” which is often the primary bottleneck for database performance.↩
26. TLS stands for Transport Layer Security. It is a cryptographic protocol designed to provide communications security over a computer network. You likely interact with it every day, as it is the “S” in HTTPS.

    What does it actually do?

    TLS provides three main pillars of security:

    1. Encryption: Hides the data being transferred from third parties.
    2. Authentication: Ensures that the parties exchanging information are who they claim to be.
    3. Integrity: Verifies that the data has not been forged or tampered with during transit.

    ↩
27. Man-in-the-Middle (MitM): A cyberattack where an unauthorized third party secretly intercepts, and potentially alters, the communication between two parties (such as a client and a server) who believe they are talking directly to each other.↩
28. Key Management Service↩

29. A Storage Area Network (SAN) is a dedicated high-speed network that connects storage devices to servers, enabling the storage to appear as if it is directly attached to the server's operating system.↩
30. Engine-Independent Table Statistics↩
31. **Nonce:** Short for "number used once", a nonce is a unique, single-use security token that prevents replay attacks and unauthorized request forgeries by ensuring each transaction or session is distinct and valid.↩
32. **Initialization Vector (IV):** A unique, random starting value used in encryption to ensure that identical data blocks produce different ciphertext, preventing pattern recognition and enhancing overall cryptographic security.↩
33. DML (Data Manipulation Language): The subset of SQL commands used to add, modify, retrieve, or delete data within existing database tables.↩
34. cgroup is short for control group. It's Linux kernel feature that organizes processes into groups to monitor and limit resource usage, such as CPU, memory, and disk I/O, for system stability.↩
35. The OOM (Out of Memory) Killer is a safety mechanism within the Linux kernel designed to prevent a system crash when RAM is completely exhausted.↩
36. **NUMA (Non-Uniform Memory Access):** A hardware architecture where a processor accesses its own local memory faster than non-local memory, requiring database optimization for efficiency.↩
37. HNSW (Hierarchical Navigable Small World): A multi-layered, graph-based algorithm used for lightning-fast vector searches by finding "nearest neighbors."↩
38.
39. Data Modification Language, a part of the SQL language.↩
40. Data Modification Language, a part of the SQL language.↩
41. Data Definition Language, a part of the SQL language.↩
42. CTE (Common Table Expression): A temporary, named result set that exists only for the duration of a single `SELECT`, `INSERT`, `UPDATE`, or `DELETE` statement, used to make complex queries more readable.↩
43. CTE (Common Table Expression): A temporary, named result set that exists only for the duration of a single `SELECT`, `INSERT`, `UPDATE`, or `DELETE` statement, used to make complex queries more readable.↩
44. Brute Force (BF) conflict resolution mechanism:
    - Transaction Conflicts: In a multi-master environment where multiple nodes can process transactions simultaneously, a conflict can occur if two transactions try to modify the same data at the same time.
    - Brute Force (BF) Abort: When a conflict is detected, one of the conflicting transactions (the "victim") may be "killed" or aborted to allow the other transaction (the "aggressor") to proceed and maintain data consistency across the cluster. This is referred to as a "Brute Force" approach to conflict resolution.
    - Information Schema Table: The "Information schema table displaying history of BF aborts" is a system table (like `wsrep_local_bf_aborts` in Galera Cluster) that tracks the count or history of these brute force transaction terminations. This is a crucial metric for monitoring cluster health and identifying problematic transactions or high-contention ar

    ↩
45.
46. DML (Data Manipulation Language): The subset of SQL commands used to add, modify, retrieve, or delete data within existing database tables.↩
47. Random Query Generator↩
48. Random Query Generator↩
49. WorkLogs↩
50. WorkLog↩
51. Information Schema↩
